Jacob C. Brubaker was born December 25, 1834, at Lancaster, Pennsylvania. His parents came to Minnesota in 1857 and settled at Wilton. He did not come at that time as he was a medical student, or had just graduated. In 1861, at the start of the Civil War, he was practicing in Richmond, Virginia. He was given the choice of joining the army as an army surgeon or going to Libbey prison. He joined the army. Just when he came to the west is not known, but he practiced at Alta, Iowa, at one time, probably before coming to Waseca. He came to Waseca in July, 1868, and was married there in 1876 to Miss Lallie Smith. They had twin sons, Roy and Guy. Roy is thought to be still living (1952) in California; Guy died a few years ago.

While in Waseca, Dr. Brubaker owned a drug store, too, on the site of the Waverly Hotel building. He left Waseca in 1879 or 1880 and went to Germany to specialize in gastrointestinal diseases. He was there for about two years, but never returned to Waseca. In 1898, he was known to be running a private hospital in Chicago and specializing in stomach disorders. About 1907 he moved to Colorado Springs where he died in 1912. He is buried there.

William A. Chamberlain was born in 1853 at Putney, Vermont, the son of William Merritt Chamberlain (born at Brattleboro, Vermont) and Sophia Kelly Chamberlain (born at Chesterfield, New York). He graduated at Rush Medical College in 1882.

He was written up in the Winona County notes on Medical History in the June 1940 issue of MINNESOTA MEDICINE. "William A. Chamberlain graduated at Rush Medical College in 1882. He located at St. Charles, Minnesota in February of the same year. In January 1883, he purchased a stock of drugs, then ten months later, he moved to Winona to engage in the drug business. He continued his store in St. Charles under a manager and introduced Dr. Knapp of Maine as a successor to his practice there." Later, he moved back to St. Charles. He is referred to also in Nora Guthrey's notes on Olmsted County as one of the two doctors from nearby towns, who on one occasion took over the practice of Drs. Will and Charlie Mayo for a few days on some rare occasion, when both were away at the same time. He was president of the Winona County Medical Society in 1896. At one time he was mayor of St. Charles. He was married while there and had one son, who died at the age of twenty-two months of spinal meningitis.

In 1898, he moved to Waseca, where Mrs. Chamberlain died on March 16, 1925. She was buried at St. Charles.

He was an unusually studious and well read man. His advice was often sought by other doctors in consultation. He was not too interested in carrying on an extensive practice and every year or two went away to take a short course of some kind or visit clinics, usually in the east. He was a great writer, and wrote five books, though only one was published. It was a large volume of four or five hundred pages, written for use in the home by the public. The title was "A Guide to the Prevention of Disease and the Preservation of Health." It contained a description of the various diseases with home treatment which he recommended. This was mixed with a great deal of philosophy and wit and humor of his own, which added great spice to the reading.

While at Waseca he was for many years associate surgeon for the Chicago and Northwestern Railway. During the last few years of his life his health failed considerably due to gall bladder disease and common duct obstruction. In September of 1930, he decided to retire and return to Vermont where he had a sister and two brothers still living. On the morning of September 27, 1930, he was found dead in a berth on a Boston and Albany train, near Pittsfield, Massachusetts, his death being ascribed to coronary thrombosis. He was buried at West Brattleboro, Vermont.

George Christie graduated from the University of Michigan in 1882, and was practicing in Waseca by 1883. He was not married. He was a brother of Father Christie, who was pastor at Sacred Heart Church, Waseca, from about 1876 to 1890. When the diocese of Winona was started, being cut off from the diocese of St. Paul in 1890, Father Christie became pastor of a church in Minneapolis, later becoming Archbishop of Portland, Oregon. Dr. Christie moved to Minneapolis in 1890 and took up the practice of medicine there. Nothing more is known of him.

H. T. Cobb of Vivan Township is referred to in *Child's History* for 1875 as a member of the Central Committee of the Reform Party, which was being promoted at that time. He is not on the 1886 or 1890 list of doctors in Waseca County, but he is known to have practiced in Janesville for a few years, probably in the early 1880's. Nothing further is known about him.

B. M. J. Conlin is known, mainly, as the first mayor of New Richland, when that village was organized. The first Council Meeting was held on March 15, 1878. The village was started late in 1877 upon the arrival of the Minneapolis and St. Louis Railroad from Minneapolis. Apparently Dr. Conlin was in New Richland only two or three years but in September, 1927, when the town celebrated its fiftieth birthday, he was located in Los Angeles and invited to the party. He did not come because of his age, eighty years, but sent a very gracious telegram. A special edition of the *New Richland Star,* on September 22, 1927 says: "Fifty years ago, Dr. B. M. J. Conlin, a young man, came to New Richland and was elected the first mayor. Two weeks ago we located Dr. Conlin again. He is living in Los Angeles. We sent him a telegram asking him to be present at the Golden Jubilee Celebration. Last week we received a message from him regretting his inability to be here, but expressing his appreciation of the invitation. Dr. Conlin now is eighty years old. Just two weeks ago, his wife, after visiting relatives in Freeborn for a month, returned to California. She said in spite of Dr. Conlin's advanced years he was well and enjoying life. Those who remember him say that he was the 'Beau Brummel' of the village fifty years ago, that he was very progressive, handsome, a good dresser and that there was no doubt as to his medical ability." It is thought that Dr. Conlin died in Los Angeles a few years later.

Clinton T. Cook graduated from Rush Medical College in 1890. His certificate to practice is dated July 8, 1892 and he filed it with the Clerk of Court in Waseca on May 3, 1893. He came to New Richland about that time from the

Asbury Hospital in Minneapolis, where he may have been interning. Apparently he was at New Richland for only one or two years, but he is listed in an old New Richland paper as having been a member of the City Board of Health about 1894. Nothing more is known about him.

Joseph Parker Corry was born at Alexandria, Virginia, on February 2, 1856. He graduated from Bennett Medical College in Chicago in 1892 and began the practice of medicine in Janesville, Minnesota, in 1892. In 1894 he was a candidate for coroner and in 1896 for County Superintendent of Schools, each time on the Populist Ticket. At one time he practiced in Chicago on Bryant Place for about three years, the exact time not known, possibly from 1898 to 1901. In any case he was in Janesville for three or four years previous to 1904. In that year Dr. J. J. O'Hara moved from Alma City to Janesville and Dr. Corry moved from Janesville to Alma City where he ran a drug store and continued the practice of medicine. He died at Alma City in June 1912.

Robert Orr Craig was a native of New York state, born in 1834. He studied medicine at Ogdensburg, graduated at Albany, New York, Medical College. He practiced medicine in that city one year, then served as assistant surgeon in the United States Army for five years on the Pacific Coast, and was appointed surgeon of the 10th New York Infantry in 1861. He served until the end of the war. He moved to old Janesville, then called Peopolis, in 1866 to practice medicine. In 1869, when the Winona and St. Peter Railway (now the Chicago and Northwestern) reached the Janesville area it did not pass through the old town, so a new town, the present Janesville, was started about one and a half miles southeast of the old site, which was abandoned. Dr. Craig and everyone else moved to the new town. He started a drug store, in partnership with Mr. J. O. Chandler who had a general store. He served as County Superintendent of Schools in 1868-1871, and was for several years a county commissioner. He was State Senator in 1883, 1885, 1891 and 1893. He married Miss Lamb, sister of Honorable M. H. Lamb of Alton Township. They had no children, but at various times made a home for five of Mrs. Craig's nieces and nephews.

He was an active member of the G.A.R. and was prominent in all public affairs. He had the confidence of the people of Janesville to a marked degree and was worthy of it. An old resident has written:

> "Dr. Craig was much respected and gained a reputation for wisdom, by remembering 'Speech may be silver, but silence is golden.' My father and Dr. Craig served together on the Township Board and Father used to tell how it was as hard to pry an opinion out of the Doc as to dig a rock out of the road."

Although a veteran of all of the years of the war (Civil) Dr. Craig would never take a pension because he thought it should be used for those who needed it more. He died at Janesville in 1907 and is buried there.

Damon Sprague Cummings was the son of Damon J. Cummings, one of the pioneer physicians of Hastings, Minnesota. Dr. Cummings was born in Otsego County, New York, November 17, 1850. When he was six years old his parents came to the territory of Minnesota and became residents of Hastings. He attended the public schools there, spent one year at Shattuck Military School, Faribault, studied two years at Cooperstown, New York Academy, took a course in medicine and surgery at Ann Arbor University, and graduated at the Northwestern College, Chicago in 1876. He practiced medicine for a time with his father in Hastings, then came to Waseca late in 1876 and enjoyed an extensive practice during his lifetime. He was County Superintendent of Schools, Mayor of Waseca for several terms, during which time the water and light system was installed. For many years he was president of the Board of Education. He was a man of public spirit and marked ability.

For years he was the local surgeon for the railroad companies. His capacity for hard work seemed to be unlimited. He married Miss Mattie Ward in October, 1897. They were the parents of two boys, both of whom are doctors. The elder of the two, Damon W., is practicing now in the Medical Department of the Veterans Administration at Phoenix, Arizona. The younger son, William G., specializes in obstetrics and gynecology. He is on the staff of Northwestern Medical School, and is on the staff of a clinic at Winnetka, Illinois, where he lives.

Dr. Cummings died of heart trouble at St. Luke's Hospital in Saint Paul on December 25, 1910, and he is buried in Woodville Cemetery, Waseca. Mrs. Cummings is living in Waseca, and is one of its most gracious ladies.

When Dr. Cummings died in 1910, the Minnesota Valley Medical Society, then still in existence (until 1913), drew up a resolution, part of which is quoted here:

> "The Minnesota Valley Medical Society desires to express its deep sense of the loss sustained by the profession of Southern Minnesota through the untimely death of one who as a charter member, its one time secretary, and a former president, was ever faithful and zealous in the discharge of all professional duties, and place on record this memorial of his worth as a citizen, and his great ability as a physician and surgeon.
>
> "Throughout the many years of his residence at Waseca wherein was comprised the greater portion of his active life and labors, Dr. Cummings occupied a most enviable position in the estimation of the entire community, the memory of which time will not efface. Never a seeker for place or power, and by disposition the most modest of men, he, nevertheless, entered with enthusiasm into whatever made for the lasting benefit of the community he loved so well. When called upon, as he frequently was, to occupy positions of public trust, he brought to the discharge of his official duties the same care and thoroughness that characterized him in his professional relations, a broad and comprehensive grasp of whatever situation confronted him, and a judgment born of ripe experience. Thus gifted and beloved, possessing the confidence and the respect of all, he filled the measure of his days with service to his fellowmen, and gave of his time and energy in large and generous measure for the public good."

Norman C. Davis is listed in an 1886 directory as a physician in Janesville. His name is not on the 1890 nor the 1893 list. The "History of Medicine for Brown County," MINNESOTA MEDICINE, April 1941 says:

> "Dr. N. C. Davis graduated from the College of Physicians and Surgeons, and after one year in Sleepy Eye, he moved to Pipestone, where he practiced until his death in 1931."

Where he was between the time he left Janesville (late in the 1880's) and the time he started practice in Sleepy Eye is not known. He was a physician of the regular school.

(To be continued in July issue.)

President's Letter

CHILD HEALTH IN MINNESOTA

Efforts to improve Minnesota's excellent record of child health must take into account the startling fact that more childhood deaths are caused by accidents than by any disease.

It is possible to rationalize this fact in terms of medical progress, which has brought most infectious diseases of children under control, thus permitting accidents to take precedence in the mortality records. But recognizing that advancement in one field means an increasing problem in a related area obviously does not contribute materially toward solving this subsequent problem.

A recent report by the Minnesota Department of Health showed that, in Minnesota, accidents are responsible for three times as many deaths as were caused by all communicable diseases in 1951 and that accidents are the leading cause of death between the ages of one and thirty-five in this state.

Tuberculosis—a half century ago the leading cause of death in Minnesota, and the rest of the nation as well—has dropped from the list of ten leading causes of death in Minnesota. And pneumonia, once a common cause of fatalities, has yielded to new methods of treatment to the extent that deaths due to pneumonia have decreased 75 per cent. Communicable diseases are no longer the dread scourges that they were fifty years ago. The over-all record for reduction of deaths due to disease shows that it has been twice as great as that for reduction in deaths from accidents.

Physicians must aid in the important educational programs that are being introduced to curb this dismaying death toll. In 1951, a total of 1,804 accidental deaths occurred in Minnesota. Twenty per cent of these deaths were persons under the age of twenty.

Motor vehicle accidents lead the accident mortality list; therefore our educational efforts must be directed primarily toward prevention of these. Drownings, burns and accidents with firearms rank next in order.

Obviously, these are preventable deaths. No miracle drugs or new surgical techniques are needed to control this public health problem. It is a matter of educating parents and children, of focusing public attention on water, traffic and other hazards so that these may be eliminated or minimized and of enforcement of applicable regulations.

Roger L J Kennedy

A PLEA FOR CONTINUED IMPROVEMENT IN ADOPTION PRACTICES IN MINNESOTA

ONE of the fundamental objectives of any married couple is to raise a family. When, for various reasons, some couples are unable to have children of their own, they may turn to anyone who can provide them with one or more babies.

In the past fifty years methods whereby a childless husband and wife could obtain a baby have changed. It is now the opinion of all those who are interested seriously in the problem that it is best done by means of a public or private agency that is approved by the state for placing the child. A baby obtained from such a source is most likely to be in good health and not mentally retarded.

Use of these approved agencies ensures consideration of the following vital factors: (1) adequate information is available regarding the youngster's parental history; (2) the real and the adoptive parents will never know each other or learn the whereabouts of each other; (3) adoption will not later be disputed legally by the real parent or parents; (4) the adoptive home will be suitable for the baby; (5) adequate follow-up visits will be made to be sure the adoptive parents and the child have been matched properly and (6) the costs will be reasonable.

None of these advantages are present when a baby is secured privately or through an unauthorized agency. Costs of obtaining a baby under these circumstances may be exorbitant.

So-called black or gray markets for babies exist in several parts of the country, chiefly near large cities. They flourish for two reasons: (1) the demand for babies exceeds the supply and (2) prospective adoptive parents do not wish to undergo the long period of waiting often necessary when infants are obtained from an approved agency. Workers in the Division of Social Welfare and others concerned with the problem are of the opinion that few of these markets exist at present in Minnesota.

Many states have laws regulating not only adoption but placement of infants as well. Minnesota has such laws. Section 257.03 from Minnesota Statutes 1949 Annotated is as follows:

> "*Notification of Director of Social Welfare.*—When any person, group of persons, organization, association or society shall place or assist in placing a child in a private home, not licensed as an infants' home, for the purpose of providing the child with a permanent home or for adoption, the person or those responsible for the placing of the child shall as soon as possible and not more than 30 days after the child is so placed notify the director of social welfare, in writing, giving the name and address of the child, the name and address and relationship to the child of the person or persons with whom the child has been placed together with such other information regarding the child and his foster home as may be required by the director of social welfare."

Other parts of section 257 and also parts of section 259 and 144 concern adoption and adoptive procedures.

This law is disregarded a number of times each year. Physicians are sometimes responsible for this failure to notify the authorities of placement of a child. In many instances this has been the result of ignorance of the law rather than of intent to break the law. Such omissions of notification always come to light when the petition for adoption is filed. All placements not made by the State Division of Social Welfare or by an authorized agency for placement must be investigated when this petition is filed. Such petitions cannot be filed until the child has been in a home for at least six months. After a child has lived in a home for that length of time it is usually too late to do anything constructive if a mistake in placement has been made. The purpose of the Minnesota legislation is to prevent hasty or ill-advised placements from occurring at all.

Even placements in boarding homes must be handled with some thought. In the past year in Minnesota, forty children were placed in boarding homes for temporary care and then subsequently were adopted by the boarding parents.

The number of nonrelative and nonagency placements of babies has decreased a little in our state in the past three years. This is commendable. However, from July, 1950, to July, 1951, 11 per cent of petitions for adoption originated from sources other than those of relatives and approved agencies.

A recent letter from A. F. Angster, Chief of Child Welfare in the State Division of Social Welfare, stated that hasty or ill-advised placements have not been reduced during the past year; if anything, they have increased.

In 1951, physicians were concerned in 38 of 134 (or 28 per cent) nonagency and nonrelative placements in Minnesota. Physicians may have been concerned in some of an additional 28 placements, but data on this group are not available.

It is the duty of the physician to be sure that the physical and mental status of a child who is a prospect for adoption has been evaluated correctly and approved. Though the physician may desire to help childless parents or a homeless child, he may have neither the time nor the technical sociolegal experience to do so properly. It is the duty of approved agencies to make placements and to ensure that such placements are best from the standpoint of the adoptive parents and, what is even more vital, that they are best from the standpoint of the adopted child.

Association

MINUTE WOMEN

IT IS a thrilling experience to hear Suzanne Silvercruys Stevenson, National Chairman of The Minute Women of the United States of America, Inc., speak on the need for the women of the country to organize for the defense of the freedom of America. To hear her is to be convinced of the need of combating communism and collectivism in general; to carefully scrutinize the text books used in our schools; to prevent the publication and dissemination of literature intended to undermine religion, the family as a unit, and patriotism, and to mislead youth on the subject of sex.

It is said that a true appreciation of the value of liberty is attained only when that liberty is lost. This was the case with Suzanne Silvercruys. A native Belgian, caught by the rapid advance of the German army in August, 1914, she knew the terror of living in an occupied country, where even footsteps on the street at night were terrifying. She escaped at the risk of her life into Holland and thence to England and eventually to the United States. Always an admirer of our country and things American, she became a citizen thirty years ago.

Being a sister to the present Belgian ambassador and in touch with politics and social legislation, she has seen more clearly than most native Americans the recent trend towards socialism and collectivism which has invaded our economy. It was she who was responsible for the getting together of 127 Connecticut women on September 22, 1949, to form the Minute Women of the United States of America, determined to demand economy, morality and efficiency in government and to protect the freedoms guaranteed by the Constitution of the United States.

Mrs. Stevenson has provided not only the spark that initiated the movement but has been the dynamo which has spread it into twenty-six states. She is at present flying all over the country to address groups of women and to stir them up to do their bit by joining The Minute Women. Numbers rather than money is the aim. Membership is $2.00 and a pledge to vote at each and every election. New members are urged to obtain five additional members. New members receive a pin which they are urged to wear continuously. They also receive a monthly newsletter which contains informative material.

Women, wherever located, are urged to form units for local action. Information may be obtained by writing to the national Headquarters of The Minute Women of the United States of America, Inc., R.F.D., North Windham, Connecticut, which is Mrs. Stevenson's residence. Memberships, too, may be obtained direct by sending the fee of $2.00 to North Windham or to the treasurer of the Saint Paul Chapter, Miss Georgia Nichols, 775 West Cottage Street, Saint Paul.

Here is a worthwhile, non-partisan organization, which welcomes members of all creeds and races who believe in God and want to preserve our freedom. We suggest a serious consideration by the various units of the Woman's Auxiliary of the State Medical Association.

MINNESOTA STATE MEDICAL ASSOCIATION

Ninety-ninth Annual Meeting

Registration figures for the ninety-ninth annual meeting of the Minnesota State Medical Association prove the outstanding popularity of the annual conventions for the medical profession of Minnesota. Some 1,798 doctors registered at the Minneapolis Auditorium; 643 nurses, dietitians, technicians, social workers and medical secretaries; 148 scientific exhibitors; 506 commercial exhibitors; 268 woman's auxiliary members; and 361 miscellaneous guests which include interns, graduate students, nursing trainees and other hospital staff and medical staff and school members. The total registration figure was 3,724.

Scientific sessions, both special and general, were well attended, and doctors heard authoritative discussions by speakers well-known in their respective fields. Doctors and their guests heard informative discussions by guest speakers on "The Induction of Labor," Dr. Hugh G. Hamilton of Kansas City, Missouri, and Dr. Leon S. McGoogan of Omaha, Nebraska; "Clinical Aspects of Abnormal Small Intestinal Physiology," Dr. Ross Golden of New York; "Practical Aspects of the Rh Factor," Dr. Edith L. Potter of Chicago; "Carcinoma of the Cervix," Dr. Richard W. Te Linde of Baltimore, Maryland; "Treatment of Convalescent Cardiac Cases," Dr. Chester M. Kurtz of Madison, Wisconsin; "Some Recent Advancements in the Management of Hypertension," Dr. Carleton B. Chapman of the University of Minnesota; and "Recent Advances in Research on Rheumatic Fever," Dr. Lewis Thomas of the University of Minnesota.

On Monday night, May 26, those attending the convention were guests of the Hennepin County Medical Society and the Minnesota State Medical Association for the Open House gathering. Schiek's Sextette presented songs from "South Pacific." The Minneapolis *Star and Tribune's* "Parade of Personalities"—Cedric Adams, Victor Cohn, Sidney Goldish, George Grim, Mary Hart, Will Jones, Charles McFadden, Virginia Safford and Bernie Swanson, appeared in person to present a few remarks for the edification and entertainment of the medical profession.

As usual, the annual banquet, on May 27, was a gala event. More than 400 doctors, doctors' wives and guests were served and were kept entertained by a fine array of presentations of awards and excellent addresses.

Presentation of gold pins and certificates to members of the "Fifty Club"—doctors who this year have completed 50 years in the active practice of medicine—was conducted by Dr. C. G. Sheppard, Hutchinson, Speaker of the House of Delegates. Awards this year were received by 20 doctors: Edmund W. Alger, Minneapolis; Nellie O. N. Barsness, St. Paul; Stephen H. Baxter, Minneapolis; Karl A. Danielson, Litchfield; J. M. Fisher, Willmar; Edward W. Humphrey, Moorhead; Wade R. Humphrey, Stillwater; Marius J. Jensen, Minneapolis; Adolph G. Liedloff, Mankato; T. P. Martin, Arlington; Oscar F. Mellby, Thief River Falls; Edward A. Meyerding, St. Paul; Olof A. Olson, Minneapolis; Matthias L. Ransom, Hancock; William B. Roberts, Minneapolis; J. Albert Schultz, Albert Lea; August C. Tingdale, Minneapolis; Henry L. Ulrich, Minneapolis; Henry J. Welles, Minneapolis; and Arthur B. Williams, St. Paul.

The association's distinguished service award and medal was presented by Dr. O. J. Campbell, Minneapolis, Chairman of the Council, to Dr. William H. Condit, Minneapolis, for his many years of service to the association, as councilor, first vice-president and treasurer.

The prize for the best scientific exhibit, a medal presented for the Southern Minnesota Medical Association by its president, Dr. W. A. Merritt, Rochester, was awarded to Dr. Jane E. Hodgson of St. Paul for her outstanding exhibit on "Frog Test for Pregnancy."

Ballots were cast at the Auditorium for the prize to be given to the most popular piece of art displayed at the Physicians' Hobby and Art Show. This prize went to Dr. J. L. Benepe of St. Paul for his painting "Mountain Evening."

The Hon. C. Elmer Anderson, governor, brought greetings to the Association, their guests and friends from the state administration.

Dr. R. L. J. Kennedy, Rochester, in his presidential address, urged physicians to shed the prototypes the public has endowed them with and work diligently during the months and years ahead to balance the equation: human relations equal public relations.

Dr. Kennedy described these prototypes in four different categories: Dr. Kindheart, the good old-fashioned doctor who cured with a mixture of friendliness and folklore; Dr. Billyou, the mental banker, who drives a high-powered car, and when not performing unnecessary and expensive operations, is available only at the country club; Dr. Germfree, the man in white, who is all science and no humanity and who dispenses a robot-like form of medical care; and hybrid of the last two: the society doctor who combines dollar interest and clinical competence.

Dr. Kennedy urged doctors to do all they could to erase these erroneous conceptions of the doctor from the public mind. He asked if the profession had allowed the personal element in relationships with patients to be overshadowed by mechanical implementation of technical knowledge and skill. He said, "Maybe doctors never were like the public thinks they used to be, but couldn't we annex some of its wishful thinking and give the public a semblance of its own concept —a modicum of sympathy, understanding and sincere, personal interest?"

Banquet guests heard the speaker of the evening, Dr. J. Martin Klotsche, president of Wisconsin State College in Madison, describe one of the disturbing aspects of the contemporary scene as the steady pushing ahead of frontiers in the field of science while the gap is widening between this technological advancement and man's adjustment to that achievement.

Dr. Klotsche expressed a basic belief in the ability of Americans to narrow this dangerous gap in the fact that we have accepted the truth that every individual possesses dignity and worth and has the right to be considered a person at all times regardless of race, color, creed, economic status or political belief. He described the vast contrasts of America as an advantage: "America is a land made up of many nationalities, races, traditions and faiths. It was born in diversity and has prospered and grown because we have cultivated multiplicity. . . . The United States is large. It does contain multitudes. But it is this incorrigible pluralism that has given us such great vitality. This diversity confounds the stranger in our midst bewildered by the existence of persons of so many different races, nationalities and creeds. But to us this diversity is no problem at all. It is in fact our greatest asset."

Annual session business meetings were begun on May 24 with the Council meeting. The Council also met daily during the convention. The House of Delegates met on May 25 and 26 for discussion of major policy decisions. New officers elected on May 26 were:

President-Elect—Dr. O. J. Campbell, Minneapolis
First Vice-President—Dr. Justus Ohage, St. Paul
Second Vice-President—Dr. C. E. Merkert, Minneapolis
Secretary—Dr. B. B. Souster, St. Paul
Treasurer—Dr. W. H. Condit, Minneapolis
Speaker, House of Delegates—Dr. C. G. Sheppard, Hutchinson
Vice-Speaker, House of Delegates—Dr. H. M. Carryer, Rochester
Councilor, Third District—Dr. L. G. Smith, Montevideo
Councilor, Fifth District—Dr. L. R. Critchfield, St. Paul
Councilor, Sixth District—Dr. H. B. Sweetser, Minneapolis
Councilor, Seventh District—Dr. W. W. Will, Bertha

Committee breakfasts were held on May 27 and 28 and reference committees of the House of Delegates met prior to the House meeting on Sunday, May 25.

INCOMES, INFLATION AND TAXES

We have just read an analysis of the change in the distribution of incomes which has occurred since the late thirties.* Attention is called to the fact that whereas in 1939 three out of four families had incomes of less than $2,000 a year, only one in three fell into that group ten years later. In the late thirties, one family in about fifty was in the $5,000-and-over income class. In the late forties, one out of six was in this class. Likewise, in the late thirties, one out of every 100 was in the $10,000-and-over group, and ten years later one out of every twenty fell into this group. This means obviously that there are more dollars to spend. We should be better off financially and everyone should be happy.

One need not be an economist to point out that two main factors modify the apparently rosy picture depicted by this marked increase in national income: the present 50 cent dollar and taxes. It is true that with an increased income, one can buy more chewing gum and Coca-Cola, but about everything else has about doubled in cost. Add to this the burdensome taxes and it is a question whether the general tendency toward an equalizing of incomes has been a "leveling up rather than a leveling down" as mentioned in the editorial.

Some further interesting figures are cited in this same editorial. According to the *Daily News,* the head of a family of four must now earn $6,783 to equal the $3,000 he earned in 1940; $11,540 to equal $5,000 in 1940; $25,800 to equal the $10,000 he made in 1940. To carry it further, a family of four should have an income of $121,000 in 1952 to equal a $25,000 income in 1940 after inflation and taxes. How many have increased their incomes to this extent?

What should be a real cause of concern is that with the already burdensome taxes bringing in billions to the federal treasury, a deficit of over 7 billion dollars has been reported* for the first eight months of the present fiscal year which began July 1, 1951. For this same eight months' period, the Federal Government paid out $41,835,968,621, compared with $26,081,947,693 spent during the same period of the previous fiscal year. We can't keep adding five to ten billion dollars yearly to our present national debt of over $260,000,000,000 and do it indefinitely. Joe Stalin must be gloating as he sees inflation and national debt increasing at a dangerous rate.

Armaments and national defense, of course, claim a large share of our economic output. We are inclined to agree with Herbert Hoover that our economy cannot stand the maintenance of a large standing army, nor is it necessary, but that we should concentrate on air and navy power. There are numerous other spheres of governmental activities in which economies are not only possible but mandatory. Congress, please take notice.

LIFE EXPECTANCY

According to the Statistical Bulletin of the Metropolitan Life Insurance Company for January, 1952, the life expectancy at birth in this country reached an all-time high in 1951 of 68.5 years. This is the company's experience in the industrial population excluding deaths from enemy action (the Korean war). Even if war deaths are included, the figure is still an all-time high. The life expectancy at birth has been increased five years in the past ten years, and ten years since the early thirties. In 1911, the expectation of life at birth was 46.6 years in the insured group, which was 6.5 years less than that for the general population of the United States.

In 1951, the mortality for tuberculosis declined 15 per cent below that of the previous year to an all-time low of 17.6 per 100,000 policy holders. This is a little more than half of the mortality only five years ago. Since 1911, the death rate from tuberculosis in the industrial population has been reduced more than 90 per cent.

Minnesota State Medical Association
George Earl, M.D., Chairman

HEALTH COMMISSION REPORTS METHODS

The President's Commission on Health Needs of the Nation has undertaken to study, in one short year, the long-range health needs of the American people. To do such a tremendous job will mean one of two things: either the Commission will have to do a fast and slipshod job in order to include all phases of this problem; or it will have to do an incomplete job in order to adequately study one or two phases of the problem. In either case, it would seem impossible to secure from the Commission a complete or accurate picture of the health needs of the American people.

Commission Adopts Standard

The broad, all-inclusive standard which the Commission has adopted for use during the study indicates that it plans to try to include as much as possible in this one year. The standard adopted is the World Health Organization's definition of health: "Health is a state of complete physical, mental and social well-being, not merely the absence of disease or infirmity." Thus it is seen that this working definition requires the goal of health services to include not only prevention, cure or alleviation of disease, but it includes *all* social measures involving environment and the people as a whole which contribute to health and the attainment of health.

Methods Dubious

On the surface, the overall methods and plans of the Commission look to be quite inclusive. But a closer inspection reveals that there is much of a general nature—a virtual skimming over of the many orbits of health needs in as heterogeneous a nation as the United States. Such general investigation cannot possibly assure obtaining an accurate picture of the nation's health needs.

The Commission is in the process of examining various phases of the health picture. Approximately twenty-five panels will be held on such general topics as prevention of disease, public medical care, general practice, and promotion of health. Each panel is to include "eight to ten leading medical and lay experts in the health area under discussion."

At the same time, the Commission's technical section on health resources will be working up an inventory of the nation's health resources. In the final stages of its work, the Commission will measure the health needs against the health resources and formulate its recommendations to the President.

This is all well and good, except for the fact that it is not thorough, it has not consumed adequate time for expert examination, and it is likely to be a hurry-up, erroneous survey. Plans to base all recommendations on the results of such inexact work would seem to be dangerous. Would it not be considerably better for the Commission to have been allotted enough time and resources to really make a comprehensive study? People responsible for considering recommended legislation based on findings from this one-year general study are more than likely to feel dubious and reluctant to support measures until more accurate and complete facts are made available.

EDUCATION FOUNDATION ISSUES FIRST REPORT

The first annual report of the American Medical Education Foundation has just been issued and it gives complete and detailed explanations of distribution of funds for 1951. Explanation is given of the different functions of the American Medical Education Foundation and the National Fund for Medical Education. The latter was organized first; its objective was "to raise annually from the medical profession, business, industry, labor, agriculture and other groups substantial sums for the unrestricted use of the medical schools in support of their teaching programs." The American Medical Association appropriated $500,000 as a nucleus for the sum for 1951. A few weeks later the AMA sponsored the establishment of the American Medical Education Foundation, a "not-for-profit corporation." The purpose of the Foundation is "to provide an instrument through which individual physicians, state and county medical societies and other professional organizations can make contributions in support of medical education."

Two Groups Work Closely

According to the report, the two fund organizations work in close conjunction with each other in order to facilitate the proper distribution of funds from organizations and individuals:

> "From its inception the Foundation has worked in closest co-operation with the National Fund for Medical Education. . . . The National Fund is designed to function on a wholesale basis and its objective is to raise funds from corporations and other organized groups. The Foundation on the other hand is conceived as a retail organization to raise funds from members of the medical profession."

Three Classes of Grants

The National Fund for Medical Education has divided money grants into three classes:

> "Class A Grants which are to be a uniform annual sum granted to each accredited medical school; Class B Grants which are to be a uniform annual sum per student in each accredited medical school and Class C Grants which will be awarded to individual medical schools on the basis of special needs and problems."

The first transfer of funds was made to the National Fund in June, 1951, in the amount of $640,682.90 representing the $500,000 appropriated by the American Medical Association and the additional contributions received to May 31, 1951. Shortly after July 1, the National Fund made an initial Class A Grant of $15,000 to each of the nation's seventy-nine four-year medical schools and of $7,500 to each of the two-year medical schools. The funds provided by the Foundation constituted 56 per cent of these grants.

The second transfer of funds occurred early in 1952, when the Foundation added its fund of $105,234.94 to the money raised by the National Fund for Medical Education during the remainder of 1951. This provided Class B Grants, calculated on the basis of $17 per student, to each medical school. For four-year schools, depending on the size of their student bodies, these grants ranged from $3,077 to $11,373.

The report states that in comparison to the large total budgets of medical schools in the nation, these sums may be small, but it explained: "In comparison with the overall operating budgets of the medical schools, these initial grants may seem small. Their importance and significance is increased, however, when it is realized that for many of the schools they constitute the largest amount of totally unrestricted money that the schools have had available in recent years. These grants have thus had a useful value far in excess of the actual number of dollars involved. That this is so has been attested to by many schools that have reported that these grants have enabled them to meet urgent needs such as employing additional instructors, providing small but vitally important salary increases for underpaid teachers or securing badly needed equipment and teaching aids."

Lessons Learned

The 1951 campaign for funds for medical education was conducted through the use of many media and through many different approaches. Among the more important observations that appeared are these:

> "1. Time and much effort will be required to make the Foundation and its objectives known to the members of the medical profession.
>
> "2. The ultimate success of the Foundation will depend on the degree of interest and effort put forth in its support by the state and county medical societies.
>
> "3. The appeal of the Foundation has been greatly enhanced by making it possible for physicians to use it as a vehicle for making contributions to medical schools in which they have a personal interest."

Local Efforts Increased

The report stated that during 1951 a total of $745,917.84 was contributed to aid medical education, by 1,811 individual physicians, thirty-four organizations and thirty-one lay friends of the profession. "Particularly encouraging was the marked acceleration in interest and activity on the part of state and county societies as the year progressed," the report went on. "In review, the accelerating momentum of the profession's inter-

1. Not included in tabulations.
2. Included in "Relief of Symptoms" as "Poor" and in "Evidence of Healing" as "None."
3. Four had no symptoms when Banthīne therapy was begun.
4. Of which seven were penetrative lesions and five partially obstructive.
5. No symptoms were present in four.
6. Two with symptoms only; no demonstrable ulcer.
7. Three were psychopathic patients and one had a ventricular ulcer of the lesser curvature.
8. Roentgen findings after treatment period of two weeks; forty-seven had duodenal deformity.
9. All returned to work within a week.
10. In these four, after relief of symptoms, Banthīne was discontinued because of urinary retention.

During the past two years, more than 200 references to Banthīne therapy in peptic ulcer and other parasympathotonic conditions have appeared in medical literature. Of these reports, 22 have presented specific facts and figures on the results of treatment in a total of 1,443 peptic ulcer patients, 67.8 per cent of whom were reported as chronic or resistant to other therapy. These results are tabulated above and show:

"Good" relief of symptoms was obtained in 81.3 per cent of the 1,405 patients on whom reports were available.

"Complete" evidence of healing was obtained in 70.5 per cent of the 883 patients on whom reports were available.

In all but 9.7 per cent, relief of pain was "good" or "fair." In all but 22.9 per cent, evidence of healing was "complete" or "moderate."

During treatment, 26 patients required surgery or developed complications other than ulcer which required discontinuance of the drug before results could be evaluated.

Of the remaining 1,417 patients, only 3.7 per cent experienced side effects sufficiently annoying to require discontinuance of the drug.

est in the Foundation must be considered the outstanding achievement of the 1951 campaign."

1952 Campaign Begun

Plans for the 1952 campaign are well under way with an additional $500,000 gift from the American Medical Association. The Foundation's activities during 1952 "will be designed to take maximum advantage of the fund-raising potentialities of state and county medical societies."

Appreciation Expressed

The American Medical Education Foundation concluded its first annual report with an expression of appreciation and a pledge of continued efforts to aid medical schools. "The initiation of a new voluntary fund-raising effort is always difficult no matter how worthy the cause," the report concludes. "Inevitably there are moments when the slow response raises doubts in the minds of even the most optimistic and determined."

"Therefore, in reporting the names of the contributors to the 1951 fund, the Board of Directors wish to record their special gratitude to these individuals and organizations. Their contributions during this first year, when the Foundation was struggling to establish itself, provided much inspiration and encouragement. . . . To all who have supported the Foundation, the Directors pledge that they will continue to do all in their power to make the Foundation a source of growing assistance to the medical schools and a program of constructive good of which every member of the medical profession can be proud."

An accurate description of public health in this country today would hardly be valid for vast areas of the world. In many parts of the world the absence of simple personal and community hygiene underlies most of the health problems, and such diseases as malaria, intestinal disorders, and tuberculosis account for a very high proportion of deaths and disability. It would be necessary to go back, therefore, as much as a century in our own history to seek a suitable content for health programs in underprivileged parts of the globe today. Health problems cannot be isolated from the environment—both physical and social—in which they exist. Such factors as the individual's job, his family life, his housing, his recreation must all be assayed for their impact on health and disease. In other words, we must now not only put emphasis on the individual and his needs, but also consider him in relation to his whole complex socioeconomic environment.—Joseph W. Mountin, M.D., *Public Health Reports,* March, 1952.

EXCESSIVE FEES MAY WRECK BLUE SHIELD PLANS

Dr. John W. Cline, president of the American Medical Association, warns in a special message of the dangers and the unethical character of excessive fees.[1] He states:

> A short time ago I received a letter from a prominent labor leader, one who is a friend of medicine. He told the following story: "Recently, in a western city, a surgeon performed an operation for uncomplicated appendicitis upon a woman patient. The operation and convalescence were routine. The fee was $150. In the same week the same surgeon performed the same operation upon another woman. It was also routine and also without complications. The fee was $300."
>
> The labor leader went on to say that the only difference between the two cases was that the first woman had no sickness insurance, while the second woman was insured under a union health plan. He charged that the surgeon had doubled the second woman's bill deliberately. What, he wanted to know, was what the medical profession doing about such unfair practices?

The AMA is undertaking a study to determine the extent of the practice of increasing fees. Intentional raising of fees, Dr. Cline believes, is not a widespread practice. but if it occurs at all, it brings discredit upon the profession. He calls on all medical societies to use disciplinary action when such practices are found in fact to exist.

In conclusion he says:

> Voluntary insurance against sickness has been sold to the American people as a practical means of protecting themselves from unexpected and perhaps overwhelming medical costs. The value of these plans must not be destroyed by the few physicians who view them as an opportunity to collect an increased fee. Voluntary prepayment plans are the medical profession's greatest bulwark against the socialization of medicine. This program must not be jeopardized by avaricious physicians who have not learned that liberty depends upon individual integrity and responsibility. Unfair and unethical conduct by a small, irresponsible segment of the profession not only harms the patients involved but endangers the freedom of medicine. These practices must be eliminated!

We submit the foregoing for the consideration of our members!—*New York State J. Med.,* May 15, 1952.

Doctor, when you peruse the advertising pages of our journal, remember this: All ads are carefully screened —the items, services and messages presented are committee-accepted. Our standards are of the highest. The advertisers like our journal—that's why they selected it for use in their promotion program. They seek your patronage, and your response encourages continued use of our publication. In turn, the advertisers' patronage helps us to produce a journal that is second to none in our state. When you send inquiries, tell them that you read their advertisement in Minnesota Medicine.

WHEN FOOD INTAKE *is inadequate*

When the patient's food intake is inadequate to supply essential nutrients in proper amounts, clinical experience has demonstrated the supportive value of a dietary supplement providing substantial quantities of virtually all needed nutrients—protein, vitamins, minerals, carbohydrate, and fat. The choice of the supplement prescribed, to a large extent, can determine the efficacy of the supplemented diet since over-all nutrient adequacy is the primary aim.

It is apparent from the data shown below that Ovaltine in milk can serve well in markedly increasing the intake of virtually all known nutrients. Taken daily during periods of inadequate consumption of other foods, it offers an excellent means for preventing subclinical nutritional deficiencies which can undermine general health or retard recovery from illness.

The appealing flavor of Ovaltine makes it acceptable to children as well as adults, including the aged. Ovaltine in milk is easily digested, an important feature when digestive disturbances are a factor.

Patients have the choice of either Plain or Chocolate Flavored Ovaltine, both of which are similar in their wealth of nutrients.

✦ Reports and Announcements ✦

FORMATION OF INTERNATIONAL FERTILITY ASSOCIATION

On October 18, 1951, in Rio de Janeiro, Brazil, delegates from twelve nations founded a new world medical society known as the International Fertility Association. The aims of this organization are:

1. To study the problems of fertility and sterility in their broad implications.
2. To stimulate scientific investigation and social awareness in the field of fertility and sterility.
3. To standardize and orient nomenclature, terminology, tests and evaluation of diagnostic methods and therapy, throughout the world.
4. To hold international congresses in the specialty in different parts of the world. These congresses are to be regularly scheduled.

The First World Congress on Fertility and Sterility sponsored by the new society will be held in conjunction with the American Society for the Study of Sterility in New York City in May, 1953.

Further information can be obtained by writing to Dr. Carlos D. Guerrero, Secretary-General, Miguel E. Schulz No. 19, Mexico, D. F., or to Dr. Abner I. Weisman, Associate Secretary-General, 1160 Fifth Avenue, New York, N. Y.

NATIONAL GASTROENTEROLOGICAL ASSOCIATION 1952 AWARD CONTEST

The National Gastroenterological Association announces its annual Cash Prize Award Contest for 1952. One hundred dollars and a certificate of merit will be given for the best unpublished contribution on gastroenterology or allied subjects. Certificates will also be awarded those physicians whose contributions are deemed worthy.

Contestants residing in the United States must be members of the American Medical Association. Those residing in foreign countries must be members of a similar organization in their own country. The winning contribution will be selected by a board of impartial judges, and the award is to be made at the annual convention banquet of the National Gastroenterological Association in October.

Certificates awarded to other physicians will be mailed to them. The decision of the judges will be final. The association reserves the exclusive right of publishing the winning contribution, and the contributions of those receiving certificates of merit, in its official publication, *The Review of Gastroenterology.*

All entries for the 1952 prize should be limited to 5,000 words, be typewritten in English, prepared in manuscript form, submitted in five copies accompanied by an entry letter, and must be received not later than September 1. Entries should be addressed to the National Gastroenterological Association, 1819 Broadway, New York 23, N. Y.

COURSE IN POSTGRADUATE GASTROENTEROLOGY

The National Gastroenterological Association announces that its fourth annual course in postgraduate gastroenterology will be given at the Hotel Statler, New York, on October 23, 24, and 25.

As in past years the course again will be under the direction and co-chairmanship of Dr. Owen H. Wangensteen, professor of surgery of the University of Minnesota Medical School, who will serve as surgical co-ordinator, and Dr. I. Snapper, director of medical education of the Mt. Sinai Hospital, New York, who will serve as medical co-ordinator.

One complete session will be devoted to a clinical pathological conference at the Mt. Sinai Hospital in New York City.

For further information and enrollment, write to the National Gastroenterological Association, Department GSJ, 1819 Broadway, New York 23, N. Y.

AMERICAN COLLEGE OF SURGEONS' CLINICAL CONGRESS

New surgical techniques and clinical developments will be presented at the thirty-eighth annual clinical congress of the American College of Surgeons to be held in New York City, September 22 to 26. More than 9,000 surgeons from all over the world are expected to attend the program of panel discussions, symposia, surgical forums, motion pictures, cine clinics, color television and exhibits. Headquarters will be at the Waldorf-Astoria.

Dr. Alton Ochsner of New Orleans, 1952 president, will preside at the opening evening session, at which Dr. Harold L. Foss of Danville, Pennsylvania, will be installed as president for the year 1953.

MINNESOTA SOCIETY OF NEUROLOGY AND PSYCHIATRY

The Minnesota Society of Neurology and Psychiatry held a meeting at Rochester on May 31. The morning session began with surgical clinics at St. Mary's Hospital, followed by the presentation of the following scientific papers:

"Seizures Produced by Mental Activity," by Dr. R. G. Bickford, Dr. Joseph Whalen, and Dr. E. D. Rooke. "Notching of the Optic Nerves and Chiasm in the Presence of Pituitary Tumors" by Dr. C. W. Rucker and Dr. J. W. Kernohan. "Neurologic Manifestations of Pheochromocytoma" by Dr. L. N. Eaton and Dr. W. F. Kvale. "Fears of Children" by Dr. E. M. Litin.

At the luncheon which followed the scientific session Dr. H. L. Parker spoke on "Alice Through the Looking Glass."

MINNESOTA OBSTETRICAL AND GYNECOLOGICAL SOCIETY

The spring meeting of the Minnesota Obstetrical and Gynecological Society was held at Rochester on May 3. About fifty state physicians attended.

The scientific program included observation of operations at St. Mary's Hospital and Colonial Hospital and the presentation of papers by the following: Dr. R. T. LaVake, Minneapolis; Dr. Alex Barno, Minneapolis; Dr. T. J. Petrick, Saint Paul; Dr. R. B. Wilson, Dr. A. B. Hunt, Dr. E. A. Banner and Dr. William Hunt, all of Rochester.

BROWN-REDWOOD-WATONWAN SOCIETY

The annual meeting of the Brown-Redwood-Watonwan County Medical Society was held at New Ulm, on May 13. Principal speaker at the scientific session of the meeting was Dr. H. Wright, Minneapolis, who spoke on "Hypertension."

Election of officers, usually held at the spring meeting, was postponed until January so that it could be held in conjunction with elections in other county societies in the state.

FREEBORN COUNTY SOCIETY

Guest speaker at a meeting of the Freeborn County Medical Society at Albert Lea on April 24 was Dr. W. E. Wellman, Rochester, who spoke on "The Advances in Antibiotic Therapy."

LYON-LINCOLN COUNTY SOCIETY

The Lyon-Lincoln County Medical Society held a meeting at Marshall on May 13. During the scientific session of the meeting, Dr. G. R. Diessner, Rochester, presented a paper entitled "Preoperative Management of the Elderly Patient."

RICE COUNTY SOCIETY

At a meeting of the Rice County Medical Society at Northfield on April 22, Dr. Donovan L. McCain, Saint Paul, was the principal speaker. His subject was "Orthopedic Problems in General Practice."

SOUTHWESTERN MINNESOTA SOCIETY

Dr. W. R. Schmidt, formerly of Worthington and now practicing in Minneapolis, was the principal speaker at a dinner meeting of the Southwestern Minnesota Medical Society at Worthington on April 14. He discussed recent advances in thoracic and cardiac surgery.

On April 28 the society held its annual spring meeting at Jackson. Featured on the scientific program was a "Symposium on Fractures" presented by Dr. Earl C. Hendrikson, Dr. Daniel J. Moos and Dr. Maynard C. Nelson, all of Minneapolis. At the close of the meeting the society members and their wives were taken on a tour of inspection of the newly constructed $100,000 Jackson Medical Center.

WEST CENTRAL MINNESOTA SOCIETY

At a meeting of the West Central Minnesota Medical Society at Morris on May 7, Dr. C. H. Scheifley, Rochester, was the guest speaker. The title of his presentation was "The Significance of Chest Pain."

Woman's Auxiliary

RAMSEY COUNTY HOLDS PUBLIC RELATIONS TEA

The Woman's Auxiliary to the Ramsey County Medical Society had as its guests on April 28 in the Ramsey County Medical library, Parent Teacher Association members, representing the fifty-seven public schools, eighteen rural Ramsey county schools, thirty-four Catholic schools, and five Lutheran parochial schools. It also entertained representatives of the Minnesota Tuberculosis and Health association, school nurses, and representative graduating students of Macalester and St. Catherine's colleges who will teach the elementary grades in the fall.

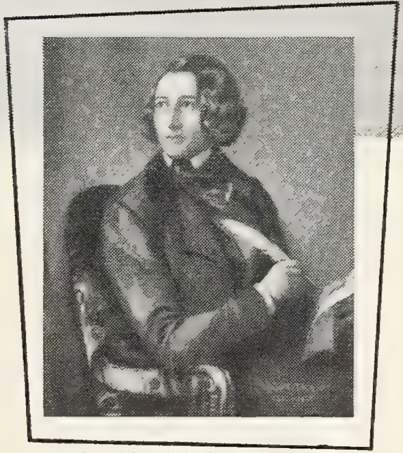
Dr. John P. Medelman, president of the Ramsey County Medical Society, greeted the 200 guests and commended them for their effort in the Summer Round-up program.

Dr. R. L. J. Kennedy, president of the Minnesota State Medical Association, gave a very instructive address concerning the community's responsibility and the physicians' responsibility in regard to the health of children. It was a source of inspiration to all Summer Round-up workers. It is hoped that all pre-school children will have a complete health inventory. In Ramsey County more than 5,500 children will be entering school for the first time in September.

Mrs. W. J. Johanson was in charge of exhibits and introduced the film, "Fluoridation of Water."

The Auxiliary is most grateful to Dr. Kennedy and Dr. Medelman for making its public relations tea a success.

Scene from "Oliver Twist"



CHARLES DICKENS
1812-1870

Psychoneurotic Men of Genius

Charles Dickens, the renowned British novelist, was subject to cyclic moods of pronounced depression characterized by intense nervous irritability and by the shedding of tears all day long. He was exceedingly sensitive to his own experiences as well as to the suffering of others.

In the great majority of psychoneurotics, there is no serious mental illness, but merely an emotional imbalance which often can be greatly improved by proper psychotherapeutic and sedative management. In the treatment of psychoneurosis, particularly agitated, depressed and anxiety states, Mebaral is preferred by many because it combines a high degree of sedative effectiveness—producing emotional stability—with a relative freedom from side effects such as languor and drowsiness. Patients usually become calmer, more cheerful and better adjusted to their surroundings without clouding of mental faculties.

In Memoriam

OLIVER WENDELL ANDERSON

Dr. Oliver W. Anderson, formerly of Luverne, Minnesota, died April 28, 1952, in Minneapolis after suffering from a heart ailment for two and a half years.

Dr. Anderson was born at Swea City, Iowa, May 10, 1912. He graduated from the University of Minnesota Medical School in 1935 and interned at Detroit Receiving Hospital, Detroit, Michigan. After serving about two years in the army, he spent fifteen months at Fort Peck Dam in Montana. In 1939, he began practice in Luverne.

He was married to Marjorie Marie Grande of Minneapolis on July 6, 1936. The union was blessed with twin boys, Robert and Roger.

Dr. Anderson was a member of the Southwestern Minnesota Medical Society, the Minnesota State Medical Association and the American Medical Association. He was a member of Our Savior's Lutheran Church of Luverne. An ardent golfer, he won a number of trophies and championships in Luverne and its environs.

JAMES WALDAMOR BYRAM

Dr. James W. Byram, Willmar, died April 28, 1952. He was forty-nine years of age.

James Byram was born May 30, 1902, in Redwood Falls, Minnesota. He graduated from the University of Minnesota medical school in 1931 and for the next twelve years had practiced medicine in Minneapolis, Echo, and Young America. He served as a surgeon for the Saint Paul police department from 1944 to 1947 when he became associated with the Hastings State hospital staff. He transferred to Willmar State Hospital in 1950 where he was a member of the staff at the time of his death.

Dr. Byram is survived by his mother, Mrs. Eliza Byram, Saint Paul; four brothers, Theodore G., Saint Paul; Ross F., Redwood Falls; Kenneth, Ball Club, and Robert, Murphysboro, Illinois; and two sisters, Mrs. Oscar J. Murset, Saint Paul, and Mrs. Fern Heinze, Los Angeles.

A. A. CHARPENTIER

Dr. A. A. Charpentier, Ramsey County chief deputy coroner for the past fourteen months, died suddenly April 12, 1952.

Born in France seventy-seven years ago, Dr. Charpentier came to Saint Paul more than forty years ago. He has been associated with the Coroner's office, Saint Paul, for several years.

MYRON F. HASSETT

Dr. Myron F. Hassett, a practicing physician of Saint Paul for nineteen years, died April 23, 1952.

Dr. Hassett was born in 1905. He received his medical degree from the University of Minnesota Medical School in 1932 and served his internship at Minneapolis General Hospital. In 1933, he opened an office at 486 Dale Street, Saint Paul.

He was a member of the Ramsey County Medical Society, the Minnesota State Medical Association and the American Medical Association.

Dr. Hassett is survived by his wife, Hildegarde; two sons, Myron F., Jr., and Charles; a daughter, Hildegarde, and his parents, Mr. and Mrs. Charles Hassett, all of Saint Paul.

ROBERT JOSEPH HODAPP

Dr. Robert J. Hodapp died following a heart attack on March 17, 1952, at his home in Willmar, Minnesota. He had suffered a very serious heart attack in 1947 and a slight one a year ago. The third attack was followed by sudden death. His wife found him lying on the kitchen floor on her return from a short shopping trip down town.

Dr. Hodapp was born August 31, 1891, in Mankato. After finishing high school at Mankato, he attended and graduated from the Mankato Teachers College in 1911. After serving as a science instructor at the Grand Marais high school for two years, he entered the University of Minnesota where he received the degrees of B.S. in 1919 and M.D. in 1920. His internship was served at St. Mary's Hospital in Minneapolis.

Dr. Hodapp first located at Madelia, Minnesota, where he remained two years, moving to Willmar in 1921. He was much interested in civic affairs, and from 1938 on he served on the Willmar recreation board. Since 1941, he had been a member of the Board of Education of Willmar. He was a past president of the Kiwanis Club, a past master of Sharon Lodge, 104 A.F. and A.M., a past commander of the Austin-Hanscom American Legion Post and a director of the First National Bank. He was also a member of the Willmar Chamber of Commerce, the Izaak Walton League, the Willmar Golf Club, the Order of Eastern Star, the Tri-County Medical Society, the Minnesota State Medical Association and the American Medical Association.

On October 16, 1920, he was married to Blanche Vinton, who survives his passing. To them were born three children, Dr. Robert V. of Willmar, Barbara Jean and Donna Marie, both of Minneapolis.

Funeral services were conducted at the family residence, March 20, by the Rev. C. R. Channer of the First Presbyterian Church. Interment was at Fairview Cemetery.

400 HARMON PLACE, MINNEAPOLIS 3, MINNESOTA

SAMUEL N. MOGILNER

Dr. S. N. Mogilner, formerly a practitioner of Saint Paul, died May 13, 1952, in Los Angeles. He was sixty-eight years of age.

Dr. Mogilner graduated from the Chicago College of Medicine and Surgery in 1913 and practiced in Saint Paul from 1913 to 1943, when he moved to Los Angeles.

Dr. Mogilner is survived by his wife and three daughters.

MORRIS L. NATHANSON

Dr. Morris L. Nathanson, formerly a well-known heart specialist of Minneapolis, died April 24, 1952, in Los Angeles, California. He was fifty-nine years of age.

Morris Nathanson was born in Minneapolis in 1892. He graduated from the University of Minnesota medical school in 1918. He joined the faculty of his alma mater in 1920 and was associate clinical professor of medicine in 1937, when he moved to Los Angeles.

At the time of his death, Dr. Nathanson was on the staff of Cedars of Lebanon Hospital, Los Angeles, and was a director of the Los Angeles Heart Association. He was also a member of the Los Angeles County Medical Association, the American College of Physicians, the Society of Experimental Biology and Medicine, and the Society of Pharmacology and Experimental Therapeutics.

Dr. Nathanson is survived by his wife, Ruth, a sister, Mrs. Samuel A. Epstein, Minneapolis, and two brothers, Benjamin, Minneapolis, and Henry, Toronto, Canada.

ALFRED MILLER RIDGWAY

Dr. Alfred M. Ridgway, a practicing physician in Annandale for over sixty years, passed away May 19, 1952, at the age of ninety.

Dr. Ridgway was born in Columbus, Wisconsin, January 29, 1863. In 1882 he came to Minneapolis and was employed in a drug store until 1887, when he entered the medical department of the University of Minnesota. He was graduated in 1890 and was the only intern at the Minneapolis City Hospital before opening an office at Annandale in July, 1890. He took postgraduate study in Chicago in 1895 and again in 1900.

Dr. Ridgway helped organize the Wright County Medical Society some sixty years ago. He was a member of the Minnesota State Medical Association and the American Medical Association. He was also a member of the American Association of Railroad Surgeons and had been a surgeon for the Soo Line since December, 1909. He was a charter member of the I.O.O.F. and Rebecca lodges of Annandale and a member of the A.F. and A.M. lodge. He served on the Village Council and was mayor of Annandale in previous years.

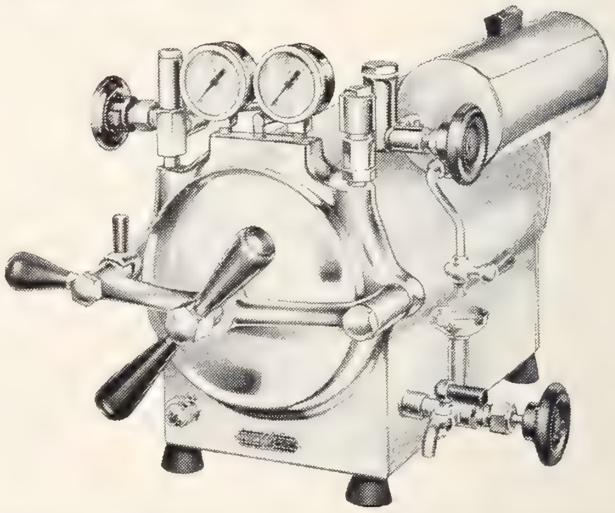
In July, 1940, Dr. Ridgway's many friends took part in a celebration of fifty years of practice by the physician. Many of those who participated were of the 3,500 brought into the world by Dr. Ridgway.

On September 20, 1892, Dr. Ridgway married Miss Nola Ponsford. She survives him. Although they had no children, they provided a home for many young girls and helped them complete their education.

HOSPITAL SPEED and SAFETY for the PRIVATE OFFICE

Autoclave Sterilization—Always the Safest—
Now the Fastest—with the

NEW PELTON FL-2



Reduces minutes to seconds between consecutive sterilizing periods.

No more waiting periods for the necessary pressure and temperature.

No more wasted time.

No more watching gauges.

Applying the principles of steam heated Hospital Sterilizers, the FL-2 Autoclave now brings to the private office a self-contained unit which produces and stores steam under pressure.

BAKER'S
MODIFIED MILK
Powder form
HOMOGENIZED
SPECIALLY PREPARED FOR INFANT FEEDING
For the Bottle-fed Baby
THE BAKER LABORATORIES

Many doctors prescribe

Baker's Modified Milk

POWDER FORM ➧

Made from Grade A Milk (U.S. Public Health Service Milk Code) which has been modified by replacement of the milk fat with vegetable and animal fats and by the addition of carbohydrates, vitamins and iron.

★

THE heat of summer is here. Now, more than at any other time of year, Baker's Modified Milk, *powder form*, offers opportunities for successful infant feeding under adverse conditions.

If refrigeration is not available in the home, or when mother and baby are traveling, Baker's Modified Milk *powder* is safe, easily dissolved and easy to use.

In the home, sufficient powder for each feeding may be measured into capped, clean, dry, sterile nursing bottles and warm, boiled water added at feeding time. When traveling, the bottles may be prepared at home, and the boiled water carried in a thermos bottle.

For the comfort of both mother and baby in hot weather traveling, we suggest that you specify Baker's Modified Milk, *powder form*.

Baker's Modified Milk is also available in liquid form. When diluted to normal strength, both powder and liquid have the same analysis and both provide the same nutritionally adequate* formula.

*When fed in normal quantities, provides amounts of proteins, vitamins (except C), minerals and essential unsaturated fatty acids equal to or exceeding the daily recommended allowances of The Food and Nutrition Board of the National Research Council.

Dr. I. L. Oliver, Graceville, made a plane trip east late in April to attend surgical clinics at New York and Boston on April 24, 25 and 26.

* * *

At an Upper Midwest conference of nurse anesthetists at Saint Paul on May 16 one of the speakers was **Dr. Richard C. Gaard,** Minneapolis.

* * *

Dr. Thomas T. Harada, formerly of Honolulu, Hawaii, has opened offices for the practice of medicine at Lake Wilson. A graduate of Temple Medical School, Philadelphia, Dr. Harada interned at St. Joseph's Hospital, Saint Paul, then served in the Army for almost four years. He has had postgraduate training in surgery.

* * *

An advance birthday party for **Dr. John deJ. Pemberton,** chief of a section in surgery at the Mayo Clinic, was held in Rochester on April 29, with eighteen of Dr. Pemberton's past and present first assistants attending. The day-long program included visits to operating rooms at the local hospitals, a luncheon, a tour of the clinic's new medical sciences building, a cocktail party and a banquet. Dr. Pemberton was presented with several gifts, including a book containing photographs and biographies of all his former assistants.

A few days later, on May 3, Dr. Pemberton reached the age of sixty-five. He will retire from the clinic staff at the end of the current quarter. He first entered the clinic as a fellow in surgery in 1913.

* * *

Dr. D. J. Halpern, Brewster, was elected chairman of the Nobles County Health Council at a meeting of the group on April 28.

* * *

Dr. William D. Coventry, Duluth, gave a talk on socialized medicine at a meeting of the Twin Ports Association of Purchasing Agents at Duluth on May 8.

* * *

Dr. J. J. Heimark, formerly of Fairmont, and **Dr. R. L. Parsons,** Monterey, formed a partnership on June 1 to practice medicine in the Triumph-Monterey community. Dr. Heimark practiced at Fairmont for twenty-five years.

Dr. Edward Johnson, who was associated in practice with Dr. Parsons during the past year, has moved to West Saint Paul to join a group of physicians who plan to operate a clinic there.

* * *

Among the speakers at the governor's third annual Conference on Children and Youth at Minneapolis on May 9 was **Dr. H. S. Lippman,** director of the Wilder Clinic in Saint Paul. He spoke on "Developing a Healthy Personality in Children and Youth."

* * *

Dr. R. H. Kath, formerly of Wood Lake, has moved to Arlington. His practice at Wood Lake is

* * *

Dr. Roy W. Dickman is now engaged in private practice at 1409 Willow, Minneapolis, Minnesota. He has finished a five-year surgical specialty training program and is limiting his practice to general and thoracic surgery. He is a member of the American Trudeau Society, a Fellow of the American College of Chest Physicians, Junior Fellow of the American College of Surgery, and is eligible for the examinations for a Diplomate of the American Board of Surgery. He is sharing offices with George D. Eitel, M.D.

BLUE CROSS-BLUE SHIELD PLANS

Blue Shield claims for the treatment of sprains and strains and the X-rays related to them have been alternately paid and rejected over a course of several years. Recently, when the original policy of rejecting such claims was resumed, so many inquiries resulted that a full review of the subject is herewith presented.

In June of 1949, treatment of sprains and strains was interpreted by the Medical Advisory Committee and Board of Directors of Blue Shield as medical rather than surgical. Since medical treatment is a valid claim only when rendered a hospitalized bed patient, office or home treatment of sprains or strains was ruled ineligible for payment as a Blue Shield claim. As a consequence, the x-ray films related to them, taken in the doctor's office, were also invalid Blue Shield claims. Following this initial interpretation, Blue Shield claims for sprains or strains were rejected or denied for some period of time.

Previously, however, advertising material and literature distributed for enrollment of Blue Shield subscribers stated or implied that claims for strains and sprains would be paid. With such material in the public's possession, it was not considered advisable to reject such claims. Consequently, the claims auditors inserted a code number in their administrative fee schedules, whereby such claims could be paid. This occurred during January, 1951.

As rapidly as possible such literature as contained these statements was recalled and more was not released. About March 1, last, an effort was made to return to the policy of rejecting such claims, as had been advised originally by the Medical Advisory Committee or Board of Directors. This policy was recently supported and emphasized at the meeting of Blue Shield plans in San Francisco. Sprains and strains and their treatment were recognized as medical in nature rather than surgical, and a nation-wide policy of so classifying them was advocated.

In the light of these facts, when the Medical Advisory Committee was informed recently of the increasing inquiries regarding sprains, strains and their treatment, it advocated paying such claims only until all literature promising their payment can be recalled and further releases stopped. Under these circumstances,

Jorgenson Elected President, Board of Trustees

Clyde M. Jorgenson was elected president of the Minnesota Blue Cross board of trustees, at an election held at the regular meeting on Friday, April 25, 1952.

Mr. Jorgenson was elected to serve the unexpired term of David E. Bronson who resigned due to pressure of other business. Mr. Bronson has been president of the board of trustees since 1948.

A resolution was passed at the directors' meeting expressing deep appreciation for the service rendered by Mr. Bronson to the Minnesota Hospital Service Association (Blue Cross), its subscribers, and contracting hospitals.

Clyde M. Jorgenson has been a member of the Blue Cross board of trustees since 1940. He also served in the capacity of treasurer of the Association and was active on various committees since his election to the board.

Mr. Jorgenson is president of the Fourth Northwestern National Bank of Minneapolis, and is treasurer of the board of trustees of Fairview Hospital, Minneapolis, and chairman of Fairview's recent building campaign.

HOSPITAL NEWS

Dedication ceremonies for the opening of the new **Meeker County Memorial Hospital** at Litchfield were held at the Litchfield High School auditorium on May 18. The dedication was followed by an open house at the hospital.

* * *

New additions to **St. John's Hospital,** Saint Paul, will be ready for use by late August. The entire project includes remodeling of the original hospital building. The installation of a nurse-to-patient intercommunication system has been approved. With the system a patient may phone the nurse at her desk and thus save her a trip from desk to patient to ascertain the patient's needs.

* * *

Miller Hospital, Saint Paul, has opened two of the floors provided by its new addition, and the third is expected to be open by September. New operating rooms, x-ray quarters, laboratory, space for surgical and medical supplies and a pharmacy will also be opened in September. An additional thirty beds being installed on the sixth floor will be available by November.

* * *

Open house was held at the new **Community Memorial Hospital** at Winnebago on May 17. To residents of the area the eighteen-bed, $150,000 structure represents a "seven-year dream come true." Plans for the hospital, which was built without the aid of federal funds, were first made by local civic leaders in 1945. The necessary money was raised by several fund drives over a period of years.

ANNUAL REPORT ON STRESS. By Hans Selye, M.D., Ph.D. (Prague), D.Sc. (McGill), F. R. S. (Canada). Professor and Director of the Institute de Medicine et de Chirurgie experimentales, Universite de Montreal. 511 pages. Illus. Price $10.00. Montreal, Canada: Acta, Inc., 1951.

This is a compilation of material published during 1951 bearing on the author's subject "Stress." It could be made possible only through the great devotion of a very orderly mind to an endocrine thesis which is vigorously criticized by some and defended by others. Whether one agrees with Dr. Selye or not bears no relation to the value of the work. It is an annual of real importance to those who have an interest in autonomic dysfunction and endocrinology.

JEROME A. HILGER, M.D.

PARACELSUS: MAGIC INTO SCIENCE. By Henry M. Pachter. 360 pages. Illus. Price $4.00. New York: Henry Schuman, 1951.

A restless rebel was Paracelsus. He was a man not content with accepting others' conclusions without knowing the "why" of them, and he had the unfortunate knack of antagonizing even those who would be his friends.

The author, a cultural historian, has attempted to present this Faustian legendary personage in an objective fashion. It is not his aim to make of him a hero or a blasphemous quack but to reveal him as a real human being in a 16th Century setting as "he faced the problems of his own days."

This book, which was the August, 1951, selection of the Book Find Club, appeals especially to those interested in the history of philosophy and ideologies and in how the same intellectual struggles are apparently repeated in each age. It is intended to be both popular and scholarly. The many notes and appendices are placed at the end of the volume so that they do not clutter up the text for those who skim, but are available to those who prefer to go into the subject more deeply.

There are a number of black and white reproductions of old woodcuts of that age suitable to the text.

To those who unthinkingly regard chemotherapy and modern psychiatry to be inventions of this age, the book is a sharp reminder of that old Biblical quotation, ". . . and there is no new thing under the sun."

M. P.

CAREERS IN SERVICE . . . to the Handicapped. Information for Vocational Guidance Specialists on the Professions of Physical Therapy, Occupational Therapy, Speech and Hearing Therapy and Special Education. 53 pages. Price 50 cents. Chicago: The National Society for Crippled Children and Adults, Inc., 1952.

In recent years the American public has been made increasingly aware of its social responsibilities, among them the provision of services to the handicapped. Public awareness of the critical need for professional workers to perform these services has not yet extended to our schools and colleges, where young people are debating which career to enter.

Students, teachers, and vocational counselors today have heard about the national shortage of nurses and physicians, our oldest health services. Fewer of them

are acquainted with the equally pressing need for other professional members of the "rehabilitation team"—the occupational therapists, physical therapists, speech and hearing therapists, psychologists, vocational counselors, special educators, social workers, and others. Nor have they been as well informed about the duties, qualifications, opportunities, and rewards in these newer fields of work.

Such information, both comprehensive and well-organized, is provided in a readable and attractively illustrated little book recently published by the National Society for Crippled Children and Adults and the National Foundation for Infantile Paralysis, with the cooperation of the Office of Vocational Rehabilitation of the Federal Security Agency. In this booklet, *Careers in Service . . . to the Handicapped,* four fields of work have been discussed which are devoted primarily to services for handicapped children and adults. These are Occupational Therapy, Physical Therapy, Special Education, and Speech and Hearing Therapy.

All are fields in which personnel shortages exist and are likely to exist for years to come, and all are fields for which specialized post-high school training is necessary. Each is treated in conformity with the N.V.G.A. standards for the preparation of occupational monographs, adequate coverage being given to duties performed, need for workers, qualifications and training required, salaries and working conditions, places of employment, and approved training facilities. An additional section is devoted to placement services of various professional organizations.

Other useful occupational materials have been published in each of these four fields of work. It is believed, however, that the comprehensiveness and organization of *Careers in Service . . . to the Handicapped,* and the fact that it brings these related occupations together under one cover for comparative analysis, will make it a favored reference for the occupations library and for the counselor of young people. It is perhaps better suited for students' reading at the college level.

FRANK M. FLETCHER, JR., *Director,*
Occupational Opportunities Service,
Ohio State University

PRACTICAL CLINICAL PSYCHIATRY. By Edward A. Strecker, Litt. D., LL. D., M.D., Professor of Psychiatry, School of Medicine, University of Pennsylvania; Franklin G. Ebaugh, M.D., Professor of Psychiatry, University of Colorado, School of Medicine and Director, Colorado Psychopathic Hospital; and Jack R. Ewalt, M.D., Professor of Neuro-Psychiatry and Administrator of Hospitals, University of Texas Medical Branch, Galveston. 7th ed. 506 pages. $7.00 Philadelphia: The Blakiston Co., 1951.

Edited by psychologically oriented psychiatrists, this book contains a minimal introduction to psychoanalytic concepts. It is a revision which is generally useful because the book was designed to furnish a frame of reference for non-psychiatric medical practitioners. A new chapter on "Support" psychotherapy is of special interest in that concrete examples are included to illustrate how it is possible to gain relief from functional illness without psychoanalytic therapy.

J. YAMAMOTO, M.D.

The SERPENT-WREATHED STAFF. A novel. By Alice Tisdale Hobart. 402 pages. Price $3.50. New York: Bobbs Merrill Co., 1951.

If Mrs. Alice Tisdale Hobart had managed to devise a suitable ending for her 402-page novel, "The Serpent-Wreathed Staff," about sixty pages sooner than she did, a tolerant critic would be able to say that she had written a faulty but highly interesting story of human conflicts and loyalties.

Unfortunately, however, the latter part of the book degenerates swiftly and recklessly into an amazing propaganda piece for National Compulsory Health Insurance. The last forty or fifty pages sound as if Mrs. Hobart knocked them out hastily at a desk piled high with pamphlets, speeches and news releases handed out by Federal Security Administrator Oscar Ewing and the Committee for the Nation's Health.

This uncraftsmanlike abuse of artistic license, added to some of the implications built up in earlier pages, creates the impression that the entire novel was designed as a subtle presentation of the case for Socialized Medicine. As a result, Mrs. Hobart undermines much of the validity that does exist in some of the earlier parts of this book about doctors, modern medicine and a changing world.

According to the significant publisher's blurb on the jacket of the book, the author's "continuing interest is in the collision of change with the existing order and the powerful forces supporting it." Then, providing a further clue to Mrs. Hobart's viewpoint, it quotes her as saying:

"I might have chosen some other profession or business. I chose medicine because it illustrates the theme so perfectly. The revolutionary upthrust which is characteristic of America since its founding meets in medicine an almost impenetrable crust of tradition, especially in the social field. On the screen of the medical profession may be thrown the story of the human heart in its most lonely aspect."

A good indication of how accurately, impartially and artistically the author has carried out her task is evident in the reaction of the *CIO News,* an organ which has been a raucous advocate of Compulsory Health Insurance and a relentless critic of the medical profession. In the January 7, 1952, issue of the *CIO News,* a book review by Hollace Ransdell concludes with the following paragraph:

"'The Serpent-Wreathed Staff' is the first attempt, I believe, to tell the story of the fight for group health and health insurance plans in fiction form. It does it competently and interestingly, and should do much to bring understanding of the real issues in the fight for better medical care for all the American people and the campaign being waged to defeat it."

Such an accolade from a source which consistently has taken an extremist position on those "real issues" is indicative of just how much real "understanding" Mrs. Hobart has contributed to the over-all problem of medical care in this country.

I'm building up a cash reserve with a savings account in the American National Bank where I'm guaranteed 2% interest on the *entire amount I have on deposit* in my savings account.

Despite her failure to give a true interpretation of the social and economic developments in medicine today, the author shows her usual skill in weaving a plot and telling a story. She is at her best when describing the personal problems and struggles, the emotional triumphs and defeats, of her principal characters. On this fictional level the book has undeniable merit and strength, for the reader finds himself sharing the fears, anxieties and grief of the people in the novel.

Mrs. Hobart drags in so many problems and projects in such a short space of time that she fails to do justice to any of them, either as a novelist or as an objective reporter of the American scene today. Among the many ingredients, skillfully mixed in, are racial discrimination against Jews and Negroes, mob psychology, group practice, a group hospital, professional ethics, preventive medicine, Voluntary Health Insurance, Government Health Insurance, treatment of the patient's spirit as well as his body, and a host of additional problems, issues and concepts.

As all of these elements are woven deftly into the novel, their manner of presentation builds the subtle implication—even in the earlier parts of the book—that most doctors are primarily and selfishly interested in making money, bolstering their own reputations and preserving the status quo in medicine.

Mrs. Hobart also gives the impression that group practice, health insurance plans, preventive medicine and similar ideas are brand new developments—practically untried and unheard of in a present-day American city. Actually, most of the concepts and projects which occur to Alan Towne, in sudden flashes of inspiration, are part of the knowledge of any alert medical student. Actually, the industrialists and businessmen on Alan's hospital board are utterly untypical when they talk and act as if they had never heard of such a thing as group health insurance for their employes.

Before Mrs. Hobart writes another novel on this subject, someone should familiarize her with the major facts and realities in the field of modern medical economics.

Someone, for example, should tell her about the many famous clinics and countless other forms of group practice which are in successful operation throughout the country, some of them since around the turn of the century.

Someone should tell her about the hundreds of fast-growing, constantly improving Voluntary Health Insurance plans, which by the end of this year will be protecting an estimated 90 million Americans against the major costs of illness and accidents.

Someone should tell her about the Nationwide progress of State and County Medical Societies in setting up doctor placement programs, grievance committees, emergency call systems, cost adjustment committees, local health units and a variety of other activities designed to make good medical care available to all the people.

Incidentally, someone also should inform Mrs. Hobart that the "National Medical Association," a name which she uses as a pseudonym for the American Medical As-

sociation, is the actual and proper name of the National organization of Negro physicians.

But Mrs. Hobart, unmindful of such trivia as facts and accuracy, writes furiously on, and after only two or three years of struggle in group practice and as head of a group hospital, Dr. Alan Towne is an advocate of Government Health Insurance. Apparently neither the author nor the good young doctor sees the glaring contradiction between Government medicine and Alan's own philosophy of careful, personalized treatment of the whole patient, in mind and spirit as well as in body.

The book becomes a completely unsubtle rehash of all the distorted, discredited propaganda for National Compulsory Health Insurance. It also gives an inaccurate, unfair picture of the purposes and methods of the American Medical Association's National Education Campaign. It fails to mention that the doctors' campaign against Socialized Medicine has won growing, Nationwide support from the American people ever since it began in January, 1949.

Everyone interested in American medicine, and in the effort to find intelligent solutions to our medical care problems, should read "The Serpent-Wreathed Staff"—if for no other reason than to help repair the damage which the book does.

Read simply as a novel, it is a moving, absorbing story. Read as a source of information affecting public opinion on medical-economic issues, it unfortunately is an example of careless, superficial writing, with a built-in conclusion contrary to the convictions of the great majority of Americans today.

F. B. E.

GOVERNMENT GIVES NOTHING FREE

With his plan for socialized medicine blocked for the moment, Federal Security Administrator Ewing has turned his sights on another scheme, socialized higher education.

He wants the federal government to finance scholarships for 50,000 high school graduates every year, and the President is backing him by putting 30 million dollars in the budget to pay for the scheme.

Commenting on the proposal, the Charlotte (N. C.) *Observer* said, editorially: "It has long been an accepted principle that public education is the function of the state and not of the federal government. But not until Oscar Ewing came on the scene was it ever suspected that the United States government was obligated to provide a college education for anybody.

"Whenever Mr. Ewing comes forward with one of his devices to give Washington bureaucrats a stranglehold on another aspect of life in this so-called free America, we should remember that the Supreme Court has held that the Federal Government has a right to regulate whatever it subsidizes."—AMA Secretary's Letter, May 16, 1952.

NEW MEDICAL FILMS

Several important medical and health films are now available to state and county medical societies through the AMA's Committee on Medical Motion Pictures. Films for the lay audience include "Be Your Age" (heart disease), "Breakdown" (mental health), "Man's Greatest Friend" (animal experimentation on rabies), and "The Nation's Mental Health." Suitable for professional meetings are "Function Anatomy of the Hand," "The Quiet One" (psychiatry), "Sciatic Pain and the Intervertebral Disc," and "Shades of Gray" (psychiatry). These films are available on a service charge basis. An up-to-date and complete list of all films added to the library in the last few months can be obtained from the committee.

LACTUM

As nutritionally

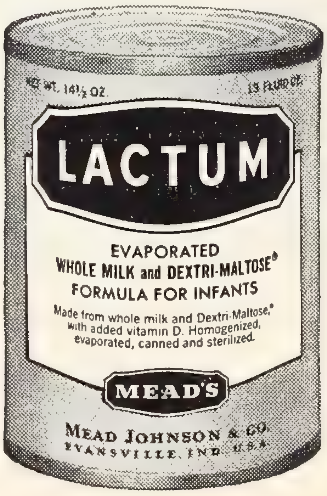
Sound

as it is

Convenient

Physicians can depend on Lactum's nutritional soundness. Lactum's milk protein (16% of total calories) provides generously for sturdy growth and sound tissue structure. Milk contributes fat of high quality. Dextri-Maltose® is incorporated to "balance" the formula—so that energy needs may be met, fat properly metabolized, and protein "spared" for its essential functions.

Cow's milk and Dextri-Maltose formulas with Lactum's approximate proportions have been used successfully for forty years.

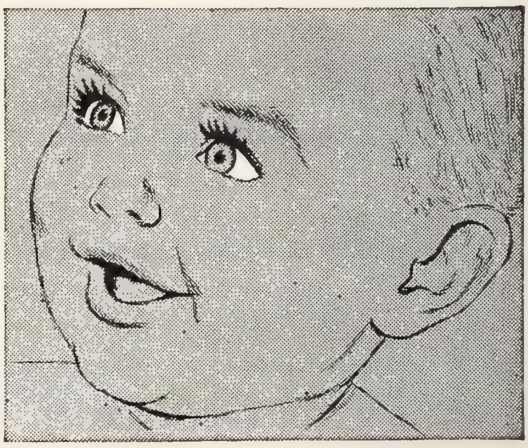


NET WT. 14½ OZ.
13 FLUID OZ.
LACTUM
EVAPORATED
WHOLE MILK and DEXTRI-MALTOSE®
FORMULA FOR INFANTS
Made from whole milk and Dextri-Maltose,® with added vitamin D. Homogenized, evaporated, canned and sterilized.
MEAD'S
MEAD JOHNSON & CO.
EVANSVILLE, IND. U.S.A.

A 1:1 dilution supplies 20 calories per fluid ounce

Mothers appreciate Lactum's convenience. Feedings are prepared simply by adding water. The 1 to 1 dilution of Lactum and water (volume for volume) eliminates complicated measurements.

Infants thrive on Lactum. Clinical observations* report infants fed Lactum show good tolerance of feedings, low incidence of digestive disturbances and infections, satisfactory growth response, and a generally "excellent" picture of health and development.



*Frost, L. H., and Jackson, R. L.: Growth and Development of Infants Receiving a Proprietary Preparation of Evaporated Milk with Dextri-Maltose and Vitamin D, J. Pediat. 39:585-592 (Nov.) 1951.

BENADRYL (diphenhydramine hydrochloride, Parke-Davis) gives rapid—and sustained—relief to patients distressed by hay fever symptoms. By alleviating sneezing, nasal discharge, lacrimation, and itching, this outstanding antihistaminic has enabled many thousands of patients to pass hay fever seasons in comfort.

BENADRYL'S reputation stems from its *clinical performance.* Each year, as the pollen count rises, the benefits derived from this effective antihistaminic are further emphasized. BENADRYL Hydrochloride is available in a variety of forms—including Kapseals®, 50 mg. each; Capsules, 25 mg. each; Elixir, 10 mg. per teaspoonful; and Steri-Vials®, 10 mg. per cc. for parenteral therapy.

BENADRYL®

How many hours 'til 6 o'clock, Doctor?

Only five. And if these 300 busy minutes seem like a dismally long stretch to you, it's time to take a searching look at the place you work and the equipment you work with.

That's only common sense. For the atmosphere of your office and the efficiency of your equipment do much to make your office-day drag along or click right by. And how do your patients feel about time spent in your office?—they're apt to find it just as pleasant or dreary as you do.

If a little serious thought convinces you that it is time for an easily-accomplished change of office atmosphere, make sure you discover the part new Hamilton *Colortone* examining room equipment can play. The warmth and charm of *Colortone's* natural-wood beauty—and 26 separate features designed to make your every hour more productive—are yours in Hamilton equipment.

Why wait any longer?

On display at your Hamilton Dealers

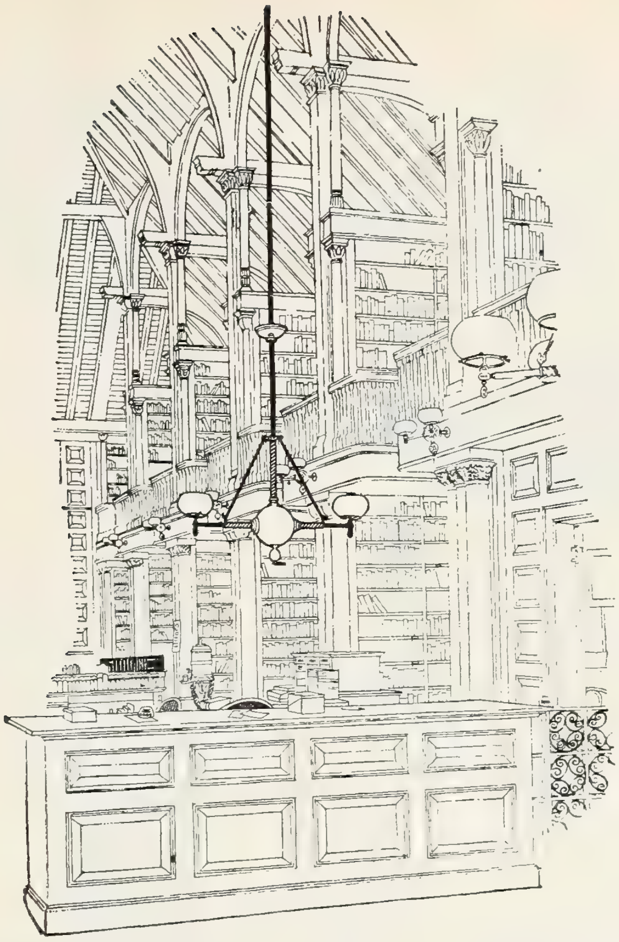
New aureomycin minimal dosage for adults—four 250 mg. capsules daily, with milk.



Interior of the
Howard Memorial Library,
New Orleans, La.

From among all antibiotics Otolaryngologists often choose

AUREOMYCIN

Hydrochloride Crystalline

because

Aureomycin appears rapidly in the tissues of the ear, nose and accessory sinuses, and in the cerebrospinal fluid.

Aureomycin, when given intravenously, attains maximum concentrations in the plasma within 5 minutes.

Aureomycin exhibits little tendency to favor the development of bacterial resistance.

Aureomycin has been reported to be effective against susceptible organisms in the following conditions frequently seen by otolaryngologists:

Laryngeal Infections • Otitis Externa • Otitis Media
Mastoiditis • Pharyngitis • Sinusitis • Tonsillitis

Throughout the world, as in the United States, aureomycin is recognized as a broad-spectrum antibiotic of established effectiveness.

Capsules: 50 mg.—Bottles of 25 and 100; 250 mg.—Bottles of 16 and 100.
Ophthalmic: Vials of 25 mg. with dropper; solution prepared by adding 5 cc. of distilled water.

ON ORAL ESTROGEN THERAPY
THAT IMPARTS ***NO ODOR,***
NO TASTE, NO AFTERTASTE

FIRST, explain away her fears of the transition and assure her you can relieve her physical symptoms. Then, to prove your point, prescribe SULESTREX. Newest advance in the field, SULESTREX is as effective estrogen therapy as science has yet created. It is a *pure* estrone salt, stable and reproducible. There are no urinaceous ingredients to taint her breath or perspiration, even when therapy is intense, prolonged.

From two recent reports:

> "*. . . a potent and effective oral estrogen with an extremely low incidence of nausea.*"[1]
>
> "*. . . all patients noted a marked sense of well-being, and commented on their ability to resume normal activity with amazing vigor.*"[2]

Other studies have shown that you can expect constant, predictable results with SULESTREX with relatively few side-effects. Try this effective, esthetic therapy on your next menopausal patient. Available at all pharmacies in 0.75-, 1.5- and 3-mg. grooved tablets. Send for literature. Abbott Laboratories, North Chicago, Illinois. Abbott

MEAT...and the Cholesterol Content of the Diet

An essential constituent of human tissue, contributing to the normal functioning of all cells, cholesterol has been widely discussed as a factor in the etiology of atherosclerosis. Yet this lipid is required in many metabolic processes, and, furthermore, evidence is lacking that withholding cholesterol from the dietary is effective in preventing atherosclerosis.

In a recent plea for a return to the basic fundamentals of nutrition in the prophylaxis of atherosclerosis, it was emphasized that to eliminate cholesterol from the diet would mean to eliminate such animal foods as meat, milk, eggs, etc.* However, nutritionists are unanimous in asserting that these protective foods contain basic essential nutrients required for good nutrition and that to deny them would be "equivalent to the negation of practically all that nutrition science has taught us in the past."

According to these authors,* elimination of animal foods from the diet to prevent the development of atherosclerosis is unjustified on the basis of present day knowledge. They state that "there certainly is no evidence that meatless, milkless, and eggless diets should be recommended as desirable to the general public."

Meat, America's favorite protein food, always has been and continues to be an important dietary source of biologically complete protein, B vitamins, and iron. Few indeed are the conditions in which its use must be interdicted.

protein?

60%

yet as acceptable to the patient as a tasty milk shake

When the protein intake must be increased beyond the amount an acceptable diet can supply, **H.P.S.** *Sixty* proves especially valuable. Providing 60% protein, 1.5% fat, and 27% carbohydrate, it makes a delightful beverage with water or milk, readily acceptable to the patient even when anorexia prevails.

Prepared with water according to directions (6 oz. water, 1½ oz. **H.P.S.** *Sixty*), three servings daily furnish 77 Gm. of biologically complete protein. When skim milk or whole milk is used instead of water, three servings provide 96 Gm. or 95 Gm. of protein respectively.

H.P.S. *Sixty* is processed from milk protein concentrate, soy protein, whole egg powder, powdered sugar and flavoring. Its proteins are intact; hence it is not burdened by objectionable odor. Valuable for use when whole protein can be utilized, **H.P.S.** *Sixty* may be indicated in the dietary management of undernutrition, peptic ulcer, hepatitis, chronic diarrheal states, pregnancy and lactation, and following burns and other injuries which raise the protein needs. Caloric equivalent, 3.6 per Gm., 102 per ounce.

vital capacity before Orthoxine
vital capacity after treatment

an answer to asthma

Q. Is there a sympathomimetic agent that will give relief from asthma without causing vasopressor and psychomotor stimulation?

A. Orthoxine Hydrochloride provides bronchodilatation with minimal vasopressor and psychomotor stimulation. By modifying the configuration of a sympathomimetic amine molecule, the action of Orthoxine has been centered mainly upon bronchodilatation, thereby minimizing side-effects arising from vasopressor or psychomotor-stimulating activity.

Orthoxine*

ACCEPTED COUNCIL ON PHARMACY AND CHEMISTRY AMERICAN MEDICAL ASSOCIATION

HYDROCHLORIDE

BRAND OF METHOXYPHENAMINE

Bottles of 100 and 500 tablets.

Orthoxine Hydrochloride (100 mg.) tablets contain *beta-(ortho-*methoxyphenyl)-isopropyl-methylamine hydrochloride, a bronchodilator and antispasmodic.

General Electric announces...
a new, improved Inductotherm

The product of complete restyling and redesigning, General Electric's new Model F Inductotherm meets every requirement for modern diathermy technics. More than handsome appearance, this scientific development offers advanced features like these:

- Absolute crystal control limits variation from approved frequency to less than 0.05%.
- Over 200 watt output — for most efficient utilization of induction heating methods.
- Provision for three types of electrodes — contour, cable and air-spaced.
- Surgical facilities, now an integral part of the unit, for all medium and light technics.

Ask your GE x-ray representative for all the facts on the Model F, the Inductotherm apparatus that *fully* meets today's needs.

WORLD'S LARGEST PRODUCER OF ANTIBIOTICS

FIRST RESORT
in NONSPECIFIC PROCTITIS *and* ULCERATIVE COLITIS

ACCEPTED
COUNCIL ON PHARMACY AND CHEMISTRY
AMERICAN MEDICAL ASSOCIATION

Negative results with certain other forms of therapy have prompted many physicians to turn to NISULFAZOLE as a "last resort"—only to discover that it should have been their first approach to NONSPECIFIC ULCERATIVE PROCTITIS and COLITIS.

NISULFAZOLE frequently brings striking initial improvement in these cases . . . reduction in number of stools often occurring within the first 24 hours. Administered intrarectally, NISULFAZOLE exerts "focal" action at the site of the disease. The high incidence of remission of symptoms following NISULFAZOLE therapy is a source of gratification to physician and patient alike.

NISULFAZOLE®

10% Suspension—Brand of Paranitrosulfathiazole

Available in bottles
containing 10 fluidounces.

Doctor Harris presents his paper

Among the many demands upon his time and energy are the frequent hospital and medical society meetings which Dr. Harris attends. He never has quite enough time left over for himself. If his prescriptions were less efficient, however, the time he would be forced to spend with each patient would be greater and satisfactory results fewer. To provide more efficient therapeutic agents, the knowledge and special skills of a vast multitude of widely separated research workers are assembled by the pharmaceutical industry. An interesting example of this integration involved . . . →

Lilly

WALTER A. WEBER

. . . ferrets, eggs, and flu

The ferret's ability to drive his prey out of hiding gave his name a special significance when he was used in the laboratory to "ferret out" the elusive influenza virus. From throat washings of influenza patients, investigators recovered a virus pathogenic for ferrets and then demonstrated that antibodies against the virus were produced during convalescence. Other research groups found that the causative strains varied from one epidemic to another. Still others devised a method for removing the virus from the allantoic fluid of inoculated embryonated eggs to provide a practical means of producing ample vaccine. Finally, clinicians, including those with Eli Lilly and Company, were able to establish the preventive value of this material. The problem of varying epidemic strains, however, called for large but flexible production. Eli Lilly and Company shared in a successful trial-run which indicates that the pharmaceutical industry is able to cope with nationwide influenza epidemics in a matter of weeks. Such co-operative undertakings, financed by industry, join the talents of many investigators, lending to their efforts the important purpose of giving man increased freedom from disease.

ABUSES OF CORTISONE AND CORTICOTROPIN

ROBERT M. SALASSA, M.D.
Rochester, Minnesota

CORTISONE and corticotropin (ACTH) are active biologic substances which directly or indirectly affect many tissues and physiologic processes of the body.[13,26,27] Adequate clinical and experimental evidence demonstrates that either an excess or a deficiency of these hormones results in various pathologic changes. Convincing evidence also exists that the quantity of these hormones which is necessary to maintain homeostasis and a state of health may vary under different circumstances, and that the quantity of cortisone or similar hormones produced by the cortex of the adrenal gland can be altered by a variety of stimuli.

While the effects of corticotropin and cortisone that have been described to date justify such general statements as those above, little is known concerning the precise mode of action of these hormones. Likewise, though many physicians have acquired extensive experience with the use of cortisone and corticotropin during the past three years, the limits of therapeutic usefulness and the hazards of these hormones are not yet precisely defined. Consequently, any discussion of the abuses and hazards of the use of corticotropin and cortisone at this time represents only a current appraisal of a rapidly developing subject.

Contraindications

In view of the extremely broad physiologic and clinical effects of cortisone and corticotropin, it is not surprising that patients with some diseases would be adversely affected, and that the presence of these diseases would constitute at least a relative contraindication to the use of the hormones. A number of these contraindications exist but only peptic ulcer, tuberculosis and emotional disturbances will be considered.

Gastrointestinal Ulceration.—In 1945, Ingle and his associates[16] observed deep ulcers in the prepyloric portion of the stomachs of two rats that had received large doses of compound F. One rat also had several ulcers in the cecum. Gastrointestinal ulceration in rats subjected to various forms of stress has been described by Selye,[23] and it has been postulated that excess secretion of adrenal cortical hormones was a factor in the development of ulceration.

Gray and associates[8] observed that, when corticotropin in doses ranging from 100 to 160 mg. was administered intramuscularly daily to normal persons for periods of three to four weeks, there was an increase of approximately 200 per cent in basal and nocturnal gastric secretion of acid and pepsin. Oral and parenteral administration of 250 mg. of cortisone daily to normal persons resulted in a similar gastric response. The maximal effects on gastric secretion of acid and pepsin were observed after seven to fourteen days of administration of the hormones.

Since the advent of therapy with corticotropin and cortisone, a number of reports[1,8,9,18,24] have appeared which describe massive gastric hemorrhage and the onset, reactivation or perforation of peptic ulcers during treatment with these hormones. In some of these cases, there was evidence of previous peptic ulcer, while in others there was nothing in the history to suggest that

Read in the Symposium on the Abuses of New Therapeutic Agents at the annual meeting of the Minnesota State Medical Association, Minneapolis, Minnesota, May 26, 1952.

the patient had peptic ulcer prior to treatment with corticotropin or cortisone.

While coincidence cannot as yet be excluded completely, the reports just mentioned constitute strong circumstantial evidence that gastrointestinal ulceration and hemorrhage may be complications of therapy with corticotropin and cortisone and that administration of these hormones may be hazardous for the patient with peptic ulcer.

Tuberculosis.—A number of investigations[10,20,-25] have been reported in which administration of cortisone to animals before and after such animals were inoculated with Mycobacterium tuberculosis resulted in the occurrence of more extensive lesions or a higher mortality than was noted in a similarly inoculated group of control animals that did not receive cortisone. Freeman and associates[6] observed that while the systemic symptoms in patients with disseminated infiltrative pulmonary tuberculosis were ameliorated by administration of corticotropin, the sputum continued to show acid-fast bacilli. In one patient there was a definite spread of the pulmonary lesion during such therapy. Symptomatic improvement and a general feeling of well-being occurred in thirteen patients with advanced pulmonary tuberculosis who were treated with corticotropin and para-aminosalicylic acid.[29] However, roentgenologic examination in these cases indicated a greater tendency to cavitation. Rapidly progressive fatal pulmonary tuberculosis has been reported in one patient who received cortisone and in one patient who received corticotropin for rheumatoid arthritis.[5,17] During treatment with cortisone for arthritis, another patient with apparently arrested pulmonary tuberculosis experienced formation of a cavity and appearance of Mycobacterium tuberculosis in the sputum.[21]

Present evidence suggests that, in some unknown manner, cortisone is capable of suppressing the reaction of inflammation that occurs in response to a wide variety of different agents. If such reaction of inflammation is undesirable and detrimental, then cortisone and corticotropin, by virtue of this suppressive effect, would favorably modify the disease in question. However, if the changes produced by inflammation are desirable or protective, then cortisone and corticotropin might adversely affect the patient. While there is not sufficient evidence at present to justify a definite conclusion, the use of these hormones in most patients with tuberculosis is best avoided.

Emotional Disturbances.—Numerous reports[2,11,19,22,27] have called attention to the elevation of mood and euphoria which frequently accompany therapy with corticotropin or cortisone. This elevation of mood or euphoria seems to be the most frequent psychologic response to therapy with cortisone and corticotropin, and its presence usually does not present a serious problem. However, other more profound and serious psychologic disturbances have been observed occasionally during therapy with these hormones.[22] Psychoneurotic or frankly psychotic reactions may occur. Rome and Braceland[22] were of the opinion that the incidence of psychosis and psychoneurosis in patients who received corticotropin and cortisone probably exceeds the incidence of these reactions that would be expected in a group of patients who did not receive these hormones.

Rome and Braceland[22] also pointed out that the pattern of the psychologic response to therapy with corticotropin and cortisone is dependent on many elements. In their opinion, one of the most important factors that determine the clinical form of this response is the previous organization of the patient's personality. They observed that the psychotic reactions apparently occurred in patients who displayed evidence of marginal psychologic adjustment in the past. In view of these reports, it appears wise to avoid administration of cortisone and corticotropin in chronic diseases such as rheumatoid arthritis when these diseases occur in patients who are emotionally ill or who give a history of former serious emotional illness.

Since the presence of some diseases constitutes a relative contraindication to the use of cortisone and corticotropin, a careful and thorough general examination should always precede prolonged therapy with these hormones. The history should include careful evaluation of present and past gastrointestinal complaints and disturbances. Likewise, the physician should evaluate the patient's present emotional status and include in the history a survey of any past emotional illnesses as well as the patient's past general psychologic adjustment. The general examination should also include either roentgenographic or roentgenoscopic examination of the thorax unless the patient has recently had such an examination. Probably one of the more frequent abuses of cortisone and corticotropin in the therapy of chronic disease is the omission of a careful general examination before a prolonged course of therapy is begun.

Dosage

Present evidence indicates that what might be an ideal dose of cortisone or corticotropin in some situations would not be the ideal dose in other situations. The various doses indicated for the use of cortisone in chronic adrenal insufficiency, in diseases without adrenal insufficiency and during periods of induced adrenal suppression will be discussed.

Chronic Adrenal Insufficiency.—Patients with chronic adrenal insufficiency that is due to primary disease of the adrenal gland or that is secondary to insufficiency of the anterior part of the pituitary gland show an excellent clinical response to small doses of cortisone. Usually, the daily maintenance dose is 25 mg. or less of cortisone, given orally in divided doses. Some patients do well on as little as 10 mg. of cortisone per day and others require 20 to 25 mg. per day. Not only do these patients feel well on small doses of cortisone, but they appear to be quite sensitive to the hormone and do not tolerate large daily doses. While the activity of orally administered cortisone is rapid in onset, the duration of its activity is relatively short. This fact is not generally appreciated. Two common errors in the use of cortisone by mouth in the therapy of chronic adrenal cortical insufficiency are the administration of an excessive dose and the utilization of a single dose rather than divided doses.

While administration of 25 mg. or less of cortisone provides good clinical response under ordinary circumstances in patients with chronic adrenal insufficiency, this is an inadequate dose under conditions of stress such as are encountered in serious injury, surgical procedures, acute illness and the crises of adrenal insufficiency. Under these circumstances, doses of 100 to 200 mg. daily are usually required.

Diseases Without Adrenal Insufficiency.—In contrast to the small group of patients just mentioned who receive cortisone as a form of replacement therapy, most patients receive cortisone and corticotropin in an attempt to modify favorably diseases in which there is at present no good evidence of adrenal cortical dysfunction or insufficiency. If the disease is acute and self-limited and treatment is necessary for only a short period, the clinical symptoms can usually be suppressed successfully by the use of relatively large doses of cortisone and corticotropin without production of significant undesirable effects.

However, a more difficult problem is presented by chronic diseases, in which prolonged therapy is required. All too often, the dose of cortisone or corticotropin which controls completely the clinical symptoms also produces significant undesirable effects when it is administered continuously for long periods. Most physicians[2,3,7,30] who have had extensive experience with the use of these hormones in rheumatoid arthritis, for example, do not attempt to maintain complete suppression of the clinical symptoms by means of continuous administration of large doses. The present trend is to use a dose of cortisone or corticotropin that gives reasonable but not necessarily complete control of the symptoms and that is small enough to avoid significant undesirable effects when given over a prolonged period. In the experience of Ward, Slocumb, Polley and Hench,[30] the average long-term maintenance dose can seldom exceed the limits of 50 mg. per day for menopausal or postmenopausal women, 62.5 mg. per day for other women and 87.5 mg. per day for men, without producing significant undesirable effects.

Adrenal Suppression.—Convincing evidence exists that the administration of cortisone leads to temporary suppression of function of the adrenal cortex.[4,12,14,15,28] The minimal dose and the shortest period of administration required to suppress the adrenal glands are uncertain. However, once suppression occurs, it probably is maintained by even relatively small doses and may even persist for several months after administration of cortisone is discontinued. During this period of adrenal cortical suppression, the patient's endogenous supply of cortisone or similar hormones is limited. While the patient may show no evidence of adrenal cortical insufficiency under ordinary circumstances during this period, unusual stress associated with such conditions as major injury, operative procedures, burns or acute severe illness may precipitate acute adrenal insufficiency. Consequently, during such episodes of stress occurring in this period of adrenal cortical suppression, not only must administration of cortisone be continued but the dose should be increased. In preparation for major surgical procedures in patients who have recently been given cortisone or who are receiving maintenance doses of cortisone, it is the practice at the Mayo Clinic to give 200 mg. of cortisone intramuscularly forty-eight and twenty-four hours before operation and again on the morning of operation. After operation, the dose is reduced as rapidly as the condition of the patient will permit.

In the treatment of rheumatoid arthritis or other chronic diseases with cortisone, the following points in regard to regulation of the dose should be kept in mind:

1. The dose should be individualized to meet each patient's need and tolerance for cortisone, and the aim of treatment should be reasonable but not necessarily complete control of symptoms.

2. Multiple spaced doses should be utilized for oral administration of cortisone.

3. Sudden and drastic reduction of the dose should be avoided.

4. The patient who has been receiving maintenance doses of cortisone or in whom cortisone therapy has recently been discontinued will need additional supportive therapy during periods of stress.

I should like to caution against the use of these hormones in the treatment of undiagnosed illnesses. Because of the ability of cortisone and corticotropin to suppress or alter the symptoms of many diseases, it is not surprising that physicians are tempted to use these hormones prematurely when diagnosis is difficult and delayed. Patients with undiagnosed states of fatigue, with skeletal or muscular pain of unknown etiology, or with general malaise and low-grade fever of undetermined origin are among those who most often receive these hormones without benefit of a diagnosis. The premature use of these hormones not only is hazardous but may alter the clinical picture to such an extent that diagnosis is made even more difficult. In the latter case, the patient may be denied the benefit of more effective specific therapy. In light of the broad effects of cortisone and corticotropin, it would seem unjustified except in the most unusual circumstances to use these hormones before establishment of a diagnosis.

THE ABUSE AND MISUSE OF ANTIBIOTICS

WENDELL H. HALL, M.D., Ph.D.
Minneapolis, Minnesota

WE ARE LIVING in an age in which both physicians and the general public have come to expect miracles of medicine and surgery, leaving little to the powers of Mother Nature. Rare is the physician who has not been urged to prescribe all manner of antibiotics for patients with fever or other equivocal evidence of infection. The pace of living and of medical practice is such that all too often the first question is not "What is the cause?" but rather "Should I take sulfa or penicillin?"

There can be little doubt that a considerable part of this attitude is the result of the barrage of publicity concerning the new "wonder drugs" loosed upon the layman and physician by popular "science" writers and pharmaceutical companies. Many a physician is loath to treat a respiratory infection without giving antibiotics lest he be subject to criticism by misinformed relatives of the patient. However, it is not the purpose of this paper to explore the reasons behind this trend but rather to point out some of the effects.

Production and Cost of Antibiotics

As shown in Table I, the production of penicillin in the United States has increased astronomically in the ten years since its first use in human beings. The writer can remember the time when penicillin was so scarce and valuable that the urine of treated patients was saved and the penicillin therein extracted for other patients. Nine years ago penicillin sold for as much as $25.00 for a 10,000 unit ampule. At the moment one may purchase 500,000 units of a much more pure preparation for as little as $0.20. There has been a similar increase in production and decline in price of streptomycin since its introduction in 1945 (Table I). Production figures are not yet available for the "broad spectrum" antibiotics. There has been some reduction in their price, however.

TABLE I. PRODUCTION OF PENICILLIN AND STREPTOMYCIN IN THE UNITED STATES.*

	Year	*Quantity*
Penicillin	1942	Enough for 100 patients
	1949	8,000 billion U./mo.
	1950	22,000 " "
	1951	30,000 " "
	1952	40,000 " "
Streptomycin	1948	3,000,000 Gm./mo.
	1949	7,000,000 "
	1950	8,000,000 "
	1951	10,000,000 "

*Adapted from Welch and Lewis "Antibiotic Therapy."[4]

In Figure 1 are presented data indicating the monthly expenditure for four commonly used antibiotics in a 1000-bed general hospital during the past three years. One can see that during that period the total expenditure for antibiotics per month remained relatively stable. However, as new antibiotics came into frequent use, the amount of money expended for the other antibiotics declined. During this period the price of these antibiotics to this hospital remained quite constant. Therefore, the data give a fairly accurate idea of the changes in quantity of these antibiotics in use. They reflect the waxing and waning of enthusiasm of the physicians for new antibiotics.

Untoward Results of Antibiotic Therapy

Aside from the inconvenience, loss of time and unnecessary expenditure of money, the use of antibiotics without strict indications is objectionable from several other points of view. These objections have received publicity in medical journals, but are important enough to bear reemphasis.

1. *False Sense of Security.*—Antibiotics are often administered simply to bolster the confidence of the patient, his relatives and his physician. All too often they are given in the absence of a definite diagnosis and even in the place of indicated diagnostic procedures. Every clinical

Reviewed in the Veterans Administration and published with the approval of the Chief Medical Director. The statements and conclusions published by the author are the result of his own study and do not necessarily reflect the opinion or policy of the Veterans Administration.

Read in The Symposium on The Abuses of New Therapeutic Agents at the annual meeting of The Minnesota State Medical Association, Minneapolis, Minnesota, May 26, 1952.

pathologist and bacteriologist is aware of the difficulty which antibiotic therapy imposes upon subsequent attempts to isolate the causative organism in an infection.

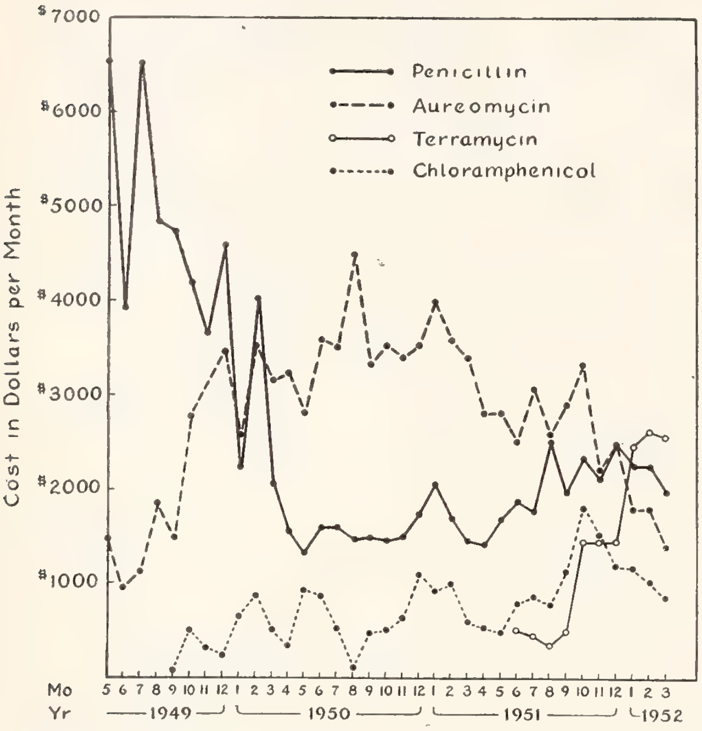

Fig. 1. Cost of antibiotics in a 1,000-bed general hospital.

The use of antibiotics may also give the false impression that everything is being done that can be done for an obscure illness. During the past year the author has had the opportunity to treat forty-four service men with vivax malaria contracted in Korea.[1] The first twenty-five patients were seen before there had been any publicity concerning the problem, either in the lay or medical press. Twenty per cent of this group had received penicillin prior to hospitalization. This was obviously largely due to the fact that the correct diagnosis had been made by the referring physician in only seven of the twenty-five patients and in none of those receiving penicillin. Smears of the peripheral blood eventually led to the correct diagnosis and treatment with effective antimalarial drugs.

2. *Development of Bacterial Resistance to Antibiotics.*—Widespread or indiscriminate use of antibiotics therapeutically, prophylactically or as food supplements may lead to a marked increase in tolerance of bacteria to those antibiotics. Presumably, the increase in antibiotic resistance results from the suppression of sensitive bacteria and selective proliferation of resistant variants arising by mutation. There can be no doubt that with such antibiotics as streptomycin the problem is a serious one. Coliform bacteria have been observed to undergo a 50,000-fold increase in resistance after only forty-eight hours of exposure to streptomycin. Similarly, many of the patients in tuberculosis sanitoria today harbor streptomycin-resistant tubercle bacilli. Time will tell whether the same phenomenon will be an important problem with isonicotinic acid hydrazide.

TABLE II. INCIDENCE OF RESISTANCE TO VARIOUS ANTIBIOTICS BY 155 STRAINS OF STAPHYLOCOCCI.

Antibiotic	*Per Cent Resistant**
Penicillin	54.8
Terramycin	27.1
Aureomycin	26.4
Streptomycin	20.6
Chloramphenicol	11.6
Bacitracin	7.1

*Resistance determined by paper disc-plate method.[2]
Antibiotic discs supplied by Difco Laboratories, Detroit, Michigan.

Antibiotic resistance has been a frequent problem in staphylococcic infections. Staphylococci seem peculiarly prone to develop resistant variants. There is evidence that staphylococci are becoming more frequently and more markedly resistant to penicillin year by year.[3] Recent studies in our own laboratory indicate that the incidence of resistance to a particular antibiotic correlates well with the amount of that antibiotic in use (Fig. 1 and Table II). The staphylococci used in the study summarized in Table II were all isolated from patients hospitalized at the Minneapolis Veterans Hospital during the period from July 1951 to April 1952. The 155 strains include all the staphylococci isolated regardless of source, coagulase reaction, pigment or hemolysin production. The sensitivity tests were all performed by the paper disc-plate method.[2] A sufficient number of strains have been tested for penicillin sensitivity using both the disc method and broth tube-dilution method to indicate that the disc method is reasonably accurate. It is generally agreed that the majority of strains of staphylococci are now resistant to penicillin; many are resistant to aureomycin, terramycin and streptomycin. All but a few are still sensitive to chloramphenicol and bacitracin.

3. *Side Effects and Hypersensitivity.*—Untoward side effects of antibiotics have received

considerable attention in the medical literature. Eighth nerve damage with streptomycin and neomycin and renal toxicity with bacitracin and polymyxin B are well-known entities. Urticaria and drug fever are commonly recorded manifestations of hypersensitivity to antibiotics. There are other less well-defined results of antibiotic therapy which may fall in this same sphere. They are illustrated by the two case reports which follow.

Case 1.—N.J.F., a white male truck driver, forty-three years old, was admitted to the hospital on February 20, 1950, for fusion of the left ankle. In 1944 he suffered a compound fracture of the lower end of the left tibia. This was followed by traumatic arthritis and recurrent phlebitis. In 1949 the left saphenous vein was ligated and stripped. At that time he was given procaine penicillin 300,000 units daily without reaction.

Physical examination revealed limited, painful motion of the left ankle. The skin of the ankle was discolored and edematous. On February 23, 1950, a left ankle fusion was done. Procaine penicillin (300,000 units daily) was given for one week prophylactically.

On March 17 he developed fever and pain in the ankle and by March 20 there was an obvious wound abscess. Aqueous penicillin G (150,000 units) was given intramuscularly every three hours for four doses on March 21. He was also given 250 mg. of aureomycin orally every four hours for three doses. The antibiotics were discontinued the following day because of fever, urticaria, severe crampy upper abdominal pain, nausea and vomiting. The abdomen was distended and roentgenograms revealed gas in the colon and small intestine. The leukocyte count was 23,400 with 84% neutrophiles and 2% eosinophiles. On March 24 he began to have diarrhea and passed several loose, bloody stools. Because of evidence of peritoneal irritation and his failure to improve with antihistaminic drugs and intestinal decompression by Miller-Abbott tube, a laparotomy was performed on March 27, 1950. There was more than 1000 cc. of clear yellow peritoneal fluid present. The jejunum and ileum were distended and edematous. Peyer's patches seemed enlarged and there was marked dilatation of the serosal blood vessels. Several ecchymoses were seen in the serosa. The mesenteric lymph nodes were only slightly enlarged. The colon appeared normal. The process was interpreted as an allergic enteritis.

The patient recovered quickly and was well by March 30. Benadryl was given during the postoperative period. On May 23, 1950, the ankle wound was incised and drained because of osteomyelitis. Aureomycin and chloramphenicol were given without event. Culture of the wound yielded penicillin-resistant staphylococci.

Comment.—This patient received procaine penicillin in 1949 and again late in Feb. 1950 without event. However, when given penicillin and aureomycin in March, 1950, he immediately developed drug fever, urticaria and an allergic enteritis with melena. Penicillin hypersensitivity seemed responsible since aureomycin was given later without reaction. Performance of antibiotic sensitivity tests upon a culture at the onset of the wound abscess would have prevented the therapeutic error.

Case 2.—D.A.P., twenty-two-year-old, male college student, was admitted to the hospital on Feb. 14, 1952. He had an upper respiratory infection beginning about Feb. 1, 1952. One week later he noted stiffness and swelling about the right temperomandibular joint. A physician denied that he had mumps and administered sodium salicylate. He continued to feel ill and had a fever. On Feb. 5 he took 300,000 units of penicillin and two tablets of a triple sulfonamide mixture every four hours. This was continued for three days without benefit. His right testicle then became swollen and tender. He was then given gantrisin and terramycin without improvement.

His past health had not been good. He was discharged from the Marine Corps in November, 1950, because of psychogenic gastrointestinal disturbances. He was immature and greatly dependent upon his mother. Aided by physicians and a friend employed as a detail man for a pharmaceutical firm, he became accustomed to the constant use of barbiturates. In addition, he used a variety of antibiotics in various forms with each of his frequent upper respiratory infections. He had suffered no side effects other than diarrhea attributed to aureomycin.

Physical examination showed a temperature of 99°F. and swelling, redness, tenderness and increased warmth of the right testicle. There were no other abnormalities.

Urinalysis revealed no pathologic changes. The hemoglobin was 16.6 Gm.% and leukocyte count 8,100 with 58% neutrophiles, 36% lymphocytes, 4% monocytes and 2% eosinophiles. The sedimentation rate was 13 mm. in 1 hour.

Chloramphenicol (500 mg.) was given orally every four hours and penicillin (200,000 units) every six hours. His temperature then rose to 101°F.; he complained of dyspnea with chest pain and began to cough up blood-streaked sputum. A chest roentgenogram showed bilateral hilar adenopathy. Bronchoscopy showed nothing other than a few flecks of blood. Smears of bronchial washings contained numerous yeast cells and mycelium; cultures yielded a non-pathogenic species of Candida (Monilia). Numerous sputum specimens showed the same yeast but no tubercle bacilli or other pathogens.

On the sixth hospital day, crepitant rales were heard at the base of the right lung and a roentgenogram showed an infiltrate in the right lower lobe and in the left upper lobe. On the ninth day a precordial gallop and a pleural friction rub at the right base were heard. The electrocardiograms revealed only nonspecific T wave changes. Penicillin and chloramphenicol were discontinued then since his fever, orchitis and hemoptysis continued unabated. His fever became septic, rising to 104° F. Because of increased fever and spreading pulmonary infiltrate, chloramphenicol (500 mg.) was given again every six hours from the tenth through the thirteenth hospital day. A weeping, erythematous dermatitis of the penis and scrotum then developed. This plus continued fever, hemoptysis and spread of the pneumonitis to the upper lobe of the right lung prompted withdrawal of all antibiotics.

Biopsy of the right testicle showed chronic nonspecific inflammation without demonstrable bacteria, yeasts or fungi; culture of the testis and of scrapings of the scrotum both contained a Candida nonpathogenic for a rabbit and without the biochemical activity or spores of *Candida albicans*. Skin tests for tuberculosis, histoplasmosis, coccidioidomycosis and blastomycosis were negative.

Within forty-eight hours after all antibiotics were discontinued, the patient became afebrile. The hemoptysis ceased and his orchitis subsided. Furthermore, physical and roentgenologic evidences of pulmonary consolidation slowly resolved. By April 11, 1952, the only demonstrable chest abnormality was "fibrosis" and moderate hilar adenopathy. At the height of his illness the leukocyte count rose to 25,300 with 75 per cent neutrophiles and a sedimentation rate of 37 mm. in one hour. During convalescence the leukocyte count and sedimentation rate returned to normal but as many as 8 per cent eosinophils were seen in the peripheral blood. The patient was discharged apparently well April 11.

Comment.—The pathogenesis of this patient's illness is not entirely clear. The most likely probability is that he had a viral respiratory infection at the onset. Treatment with multiple antibacterial agents then suppressed the susceptible bacterial flora and allowed Candida to proliferate in the bronchi. The orchitis may have been the result of drug hypersensitivity or dissemination of the Candida; pathologic proof of the latter was not obtained though culture of the testicle yielded Candida (contamination from the skin?). The occurrence of hilar adenopathy and pulmonary consolidation suggested the diagnosis of sarcoidosis. However, all but the hilar adenopathy and the pneumonitis rapidly regressed soon after the antibiotics were discontinued. The occurrence of eosinophilia during recovery supports the thesis that antibiotic hypersensitivity played an important role in his illness. Several investigators have shown that a change occurs in the flora of the mouth and gut during treatment with aureomycin, terramycin and chloramphenicol leading to a predominance of resistant yeasts, staphylococci and Pseudomonas. Perhaps similar changes may occur occasionally in the bronchi and lead to dissemination of these organisms elsewhere in the body. This thesis seems to fit well with the known facts in this case. There was no evidence of a deficiency of any known vitamin.

Summary and Conclusions

1. The astounding increase in production of antibiotics in this country in the last decade has led to a very desirable reduction in cost, but has also led to indiscriminant use by some people. This has had several undesirable effects.

2. One undesirable effect has been a false sense of security by reason of faith not justified by facts. This has led to use of antibiotics in some situations without good indications.

3. A serious hazard has been the rapid increase in prevalence of certain bacteria which are resistant to the antibiotics but are fully virulent.

4. Another important result has been the not infrequent conversion of a minor illness into a major disaster through the development of serious side effects, hypersensitivity states and alteration of the normal flora in the gastro-intestinal tract and elsewhere. The latter has been thought by some to lead to vitamin deficiencies but this remains unproved.

SOMETHING TO LOOK FOR IF YOU VISIT WASHINGTON

Some stories are news merely because they haven't been mentioned for sixty or seventy years. For example, the fact that the American Medical Association has its own memorial stone in the Washington Monument. It is at the 240-foot level of the 555-foot shaft. This was brought to our attention by Dr. Burt L. Davis of Palo Alto, Calif., who noticed the carved facing while walking down the stairs with his son. It is old and dusty, as are the records in which we are searching for more information.

ABUSES OF A LOW SODIUM CONTENT DIET IN CARDIOVASCULAR DISEASE

MILTON W. ANDERSON, M.D.
Rochester, Minnesota

IN the past decade dietary restriction of sodium has been established as an adjunct to the therapeutic management of the cardiac patient who exhibits congestion. Schroeder pointed out that restriction of the intake of salt to a level less than the urinary output of chloride will decrease edema and that restriction of the intake of water alone is ineffectual.[14] As a consequence of use of diets low in sodium for congestive heart failure, adequate intake of water ordinarily can be permitted, and as a result of the alleviation of thirst and dehydration, the patient has been made more comfortable. Dietary restriction of salt also has made the task of obtaining and maintaining cardiac compensation easier and less time-consuming for the physician.

Use of diets low in sodium has been extended also to a place in the treatment of both essential and renal hypertension and in the management of fluid retention of nephritic, hepatic and hormonal origin.

The fact that this therapeutic tool can be applied by the patient himself as a part of his daily nutritional program makes it especially attractive to him. Many patients with cardiac and other diseases of organic or functional type are particularly receptive to the idea that the cause and cure of their malady are based on what they ingest.

Restriction of the intake of sodium and chloride for heart disease is a rational therapeutic measure only when the cardiac disease has progressed to the point of provoking renal mechanisms which cause retention of these electrolytes and water. Although controversial beliefs still exist, the concept is now widely accepted that edema in cardiac failure is caused by retention of salt and water secondary to the failure of the kidneys to excrete salt and water.

The fundamental initial physiologic disturbance in chronic congestive heart failure is the relative or absolute decrease in cardiac output. As a result of decreased cardiac output, there is a decrease in the renal plasma flow and in the rate of glomerular filtration.[11] According to Stead, tubular function in straightforward congestive failure remains good. As a result the reduced glomerular filtrate with its sodium chloride and water is more nearly completely reabsorbed than normally and thus is retained.[19] Undoubtedly hormonal and probably neurogenic influences are involved in this renal participation in the syndrome of congestive failure, but the actual mechanisms are not clear.

TABLE I. FORMS OF HEART DISEASE IN WHICH THE DIET OF LOW SODIUM CONTENT IS WITHOUT SPECIFIC INDICATION

- I. Irritable heart syndrome
  - A. Extrasystolic arrhythmias
  - B. Paroxysmal tachycardias
  - C. Neurocirculatory asthenia
- II. Valvular heart disease without congestive failure
  - A. Rheumatic
  - B. Syphilitic
  - C. Subacute bacterial endocarditis
- III. Acute rheumatic fever without failure
- IV. Coronary atherosclerosis with angina pectoris and without myocardial failure
- V. Acute myocardial infarction without congestive failure
- VI. Congenital cardiovascular anomalies without congestive failure
  - A. Cyanotic type
  - B. Acyanotic type

Heart Disease Without Congestive Failure

For heart disease which is not associated with sufficient failure to produce renal retention of salt and water, the diet low in sodium has no value. Not only is this diet unnecessary but it may be detrimental to the patient from the psychologic, nutritive, economic and occasionally the health standpoints. The prescription of a diet low in sodium for patients because of the therapeutic philosophy that if no good results, at least no harm has been done, is to be deplored. Restriction of the intake of salt for cardiac murmurs, thoracic pain, dyspnea of intrinsic pulmonary origin or edema due to peripheral venous or lymphatic disease in the absence of cardiac decompensation cannot be justified.

Examples of cardiac disturbance both functional and organic in which dietary restriction of salt has been needlessly utilized are listed in Table I.

In all these types of cardiac problems the low sodium diet will have no effect on the pathologic

From the Division of Medicine, Mayo Clinic, Rochester, Minnesota.

process responsible for the symptoms and signs. Unnecessary dietary restrictions may interfere with appetite and cause unassessable nutritional impairment particularly for the patient who is recovering from rheumatic fever or acute myocardial infarction.

Psychologic factors in the management of cardiac patients have assumed an important place in this era of newspaper and radio health propaganda. Restriction of sodium when unnecessary serves to emphasize constantly to the patient his malady and to superimpose anxiety and heart consciousness which may even be detrimental to his cardiac status as well as making him genuinely uncomfortable. Diets poor in sodium necessitate the purchase of some special food products and also individualized preparation of food. This imposes an economic factor of significant proportion particularly on the needy. Depletion of sodium and chloride induced by dietary restriction of salt alone is rarely seen, but may be a real hazard when combined with administration of ionic exchange resins and mercurial diuretics, particularly when renal disease is associated. This phase of the abuse of the low sodium diet will be discussed more fully later.

Congestive Failure

In the presence of congestive heart failure of any type the low sodium diet can be abused in a quantitative way. Not all patients with congestive heart failure have disease of equal severity and consequently not all will require similarly rigid dietary management.[8]

In clinical practice low sodium diets which provide approximately 0.2 gm., 0.5 gm. and 2 gm. of sodium a day are in common usage. The diet providing 0.2 gm. of sodium a day is rarely indicated even for the most severe congestive failure. Frequently for the patient who has moderately severe congestive heart failure a diet providing 0.5 gm. of sodium can be replaced by the diet providing 2.0 gm. of sodium after compensation has been restored. When aggravating factors which have contributed to a break in cardiac compensation such as obesity, hyperthyroidism, strenuous occupation and inflammatory diseases have been removed, cardiac function may be restored sufficiently to make other than mild dietary restriction of sodium unnecessary. It is doubtful, however, whether an entirely free dietary regimen should ever be permitted the patient with organic heart disease who has once had frank congestive failure with cardiac edema.

Hypertension

Current application of the low salt diet to the management of hypertensive vascular disease was stimulated by Kempner's successes with the rice diet.[7] Grollman and associates demonstrated that rigid restriction of sodium in a more liberal diet also was associated with reduction in the blood pressure of hypertensive rats and human beings.[4] This latter observation suggested that the efficacy of the rice diet lay in its low content of sodium. Later studies have indicated that the renal hemodynamics of hypertensive patients may be somewhat impaired during treatment with the low sodium and rice diets.[1,21]

Recently, Corcoran, Taylor and Page carefully studied a series of patients and found that marked dietary restriction of sodium produced favorable effects on only approximately a fourth of the patients with severe hypertension.[3] Their studies indicated that for the diet to be of value in the treatment of hypertension the intake of sodium must be restricted to 0.5 gm. or less daily and that this dietary regimen cannot be accepted as responsible for results obtained unless the urinary excretion of sodium is determined frequently. These authors also reported that treatment with restriction of sodium should be maintained four weeks to test the responsiveness of the patient to this form of therapy. Failure to see good results after this period is an indication that the restriction is probably useless and should be discontinued.

Abuse of the low sodium diet for hypertension has manifested itself in several ways:

1. The mere advice to the patient to "go easy on the salt" is a worthless measure since restriction of intake of sodium to any extent that is less than that rigidly imposed by the diets providing 0.2 gm. or 0.5 gm. of sodium or the rice diet is therapeutically ineffective.
2. Restriction of salt sometimes is continued for months or years in the absence of clear-cut satisfactory objective responsiveness and such continuation is not justifiable.
3. Use of the diet for the hypertensive patient with diminished renal functional capacity may be an abuse because of the danger of depletion of plasma electrolytes and derangement of the salt and water mechanism.

4. Probably the most frequent abuse occurs when sodium restriction is advised for the middle aged or older patient with nonprogressive essential hypertension of long standing. This type of patient often has an exacting and conscientious personality pattern and dietary restriction of salt which offers probably negligible benefit adds to a self-imposed discipline and creates anxiety and tension which are further stimuli to hypertension.

The Syndrome of Salt Depletion

In addition to the relative abuses in the utilization of the diet of low sodium content which have been mentioned, a hazard of this regimen is the occasional occurrence of electrolyte depletion. The "low salt syndrome" has been found to occur when rigid restriction of salt alone is instituted, and also when ion exchange resin is used, particularly if there is significant renal deficiency.[9,10] Mercurial diuretics, when they have been administered frequently to the patient with congestive failure who is using a diet low in salt, however, have been held responsible most often for the electrolyte derangement in this syndrome.[2,6,17] Symptoms attributable to depletion of sodium and chloride also have been reported in cases of cirrhosis of the liver in which treatment included deprivation of salt and abdominal paracentesis.[5,13]

Schroeder[15] described this clinical syndrome in congestive failure. There is depression of the volume of urinary output and of urinary chloride associated with gain in weight, elevation of the concentration of nonprotein nitrogen in the blood and depression of the levels of plasma sodium and chloride. Coincident with these changes in water and electrolytes the patient becomes apathetic and lethargic and complains of anorexia, weakness and often of muscular cramps. The worsening of his general condition and retention of fluid are likely to encourage the physician to increase his efforts to produce diuresis and thereby further disarrange the plasma and renal electrolyte pattern.

Usually, the low salt syndrome develops after the patient with severe congestive heart failure of long standing has used a low salt diet, has further decreased the intake of sodium because of anorexia, and has been receiving frequent injections of mercurial diuretics. Such a patient has lost an excessive amount of chloride ion in the urine whereas the loss of sodium is not so great. This leads to a reduced concentration of chloride and an increase in plasma bicarbonate, that is, the laboratory picture of hypochloremic alkalosis.[16,18,20] At this point further mercurial diuretics are ineffective except to eliminate both chloride and sodium and thus also produce hyponatremia. The patient will present symptoms of the low salt syndrome described before. Continued rigid dietary restriction of sodium and chloride and their diuresis, as a result of administration of mercurials may lead to frank psychosis, coma and death.[2]

The treatment of choice for this situation is the restoration of the electrolytes to a more nearly normal state. Elevation of plasma sodium and chloride by their parenteral or oral administration will sometimes be associated with subjective improvement and responsiveness to mercurial diuretics.[2,15,20] Undoubtedly many patients who have been classified as having intractable and terminal irreversible congestive heart failure because of failure to respond to restriction of sodium and administration of mercurials actually have electrolyte depletion. Although in most such instances the severity of the cardiac disability militates against further compensation, some patients will respond again to well-conceived therapy. When hypochloremia is extreme in the absence of significant hyponatremia, use of ammonium chloride will correct the low level of serum chloride and will reduce the alkalosis.[16,20] Combined hyponatremia and hypochloremia require use of sodium chloride: either by intravenous injection of a hypertonic (3 to 5 per cent) solution or by mouth in the form of salt tablets. The proper amount of salt to administer may be determined by calculating the deficit in terms of milliequivalents and converting this amount into grams for replacement.[15] Oral intake of fluids should be restricted during therapy with hypertonic solution of salt in order to avoid any extracellular dilution. Infusion of isotonic solution of sodium chloride also cannot be expected to alter hyponatremia and hypochloremia significantly unless large amounts are given which may be hazardous for the patient with congestive failure.[15,20]

Certainly the low sodium diet is again an indicated and necessary measure for the patient who has severe congestive heart failure with peripheral edema after electrolyte equilibrium has been accomplished. Caution in the use of mercurial diuretics and frequent estimations to avoid retention of urea are essential in further management to avoid further plasma depletion of sodium and chloride.

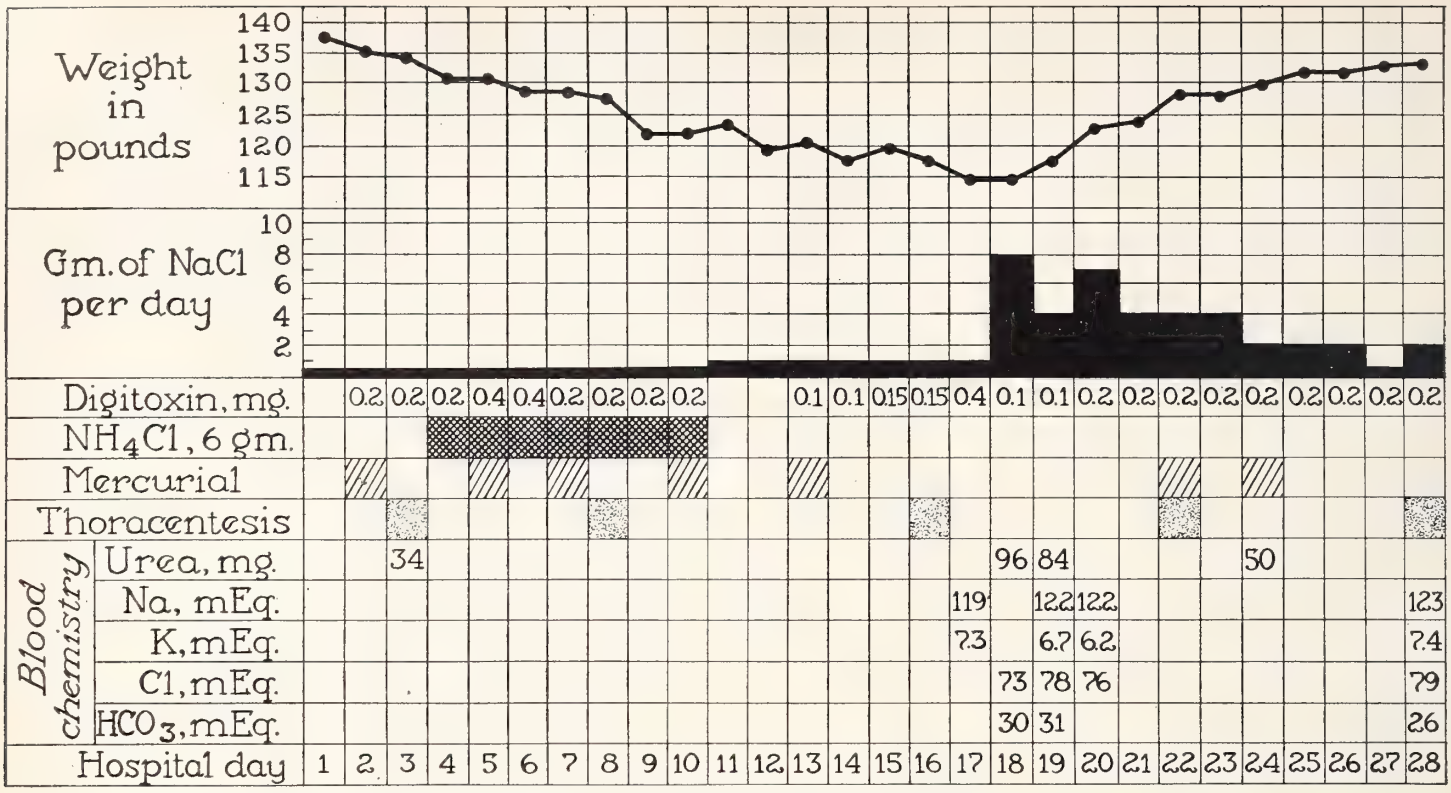

Fig. 1. Clinical and laboratory observations made in the case of a man forty-four years old, with mitral stenosis, who exhibited the low salt syndrome during his terminal illness.

Case 1 is an example of severe congestive cardiac failure and the low salt syndrome developing terminally.

Case 1.—A man, forty-four years old, was admitted to the hospital on March 3, 1951. He had known since 1940 that he had a heart murmur. Between the years of 1947 and 1950 he had five or six episodes which consisted of temperature to 103° or 104° F., chills and recurrent pleural effusion on the left side. During these years dyspnea became progressively more marked, and in October, 1950, edema appeared and albuminuria was noted.

On examination the patient presented the clinical picture of severe congestive heart failure. He was orthopneic and had distended veins of the neck, hepatomegaly, and marked peripheral and sacral edema. Apical systolic and diastolic murmurs were heard and cardiac enlargement was observed. Roentgenograms of the thorax showed a large heart of mitral configuration and bilateral pleural effusions. The electrocardiographic picture was consistent with the pattern of right ventricular hypertrophy. Albuminuria was graded 3 (on the basis of 1 to 4) and a few hyaline and granular casts were found in the voided urine.

The patient's course in the hospital was marked by severe dyspnea, orthopnea and evidence of fluid retention. Thoracentesis was necessary frequently. He complained of marked weakness, anorexia and drowsiness. Response to mercurial diuretics was poor.

Nausea, weakness and apathy were dramatically although temporarily improved on the eighteenth and nineteenth days in the hospital when extra sodium chloride was administered in the form of salt tablets and by intravenous infusions. This treatment, however, was associated with marked increase in retention of fluid and signs and symptoms secondary to increasing congestive failure. The patient died on the twenty-ninth day in the hospital. Necropsy confirmed the clinical diagnosis of severe mitral stenosis. Clinical and laboratory data collected during his hospital course are recorded in Figure 1.

This patient was treated vigorously with poor results for more than two weeks before the diagnosis of electrolyte depletion and associated azotemia was made. From an initial value of 34 mg. per 100 cc. of blood, the value for blood urea rose to 96 mg. at the time when serum sodium and plasma chloride were respectively 119 and 73.3 mEq. per liter. Mild hyperkalemia and increase in the carbon dioxide combining power (alkalosis) also were evident. Following therapy with sodium chloride these electrolyte values tended toward normal as noted in Figure 1. The cardiac lesion, however, was too severe to permit survival or even to allow restoration of plasma electrolytes to normal.

Restriction of Sodium in Chronic Cor Pulmonale

In chronic cor pulmonale, right heart failure with cardiac edema is associated with respiratory acidosis secondary to pulmonary insufficiency. As a result of deficient ventilation carbon dioxide is retained and the concentration of bicarbonate in the plasma is elevated. To compensate for retention of carbon dioxide in the blood, fixed base in the form of sodium ion must also be retained in the extracellular fluid.

TABLE II. PATIENT WITH COR PULMONALE

	Day in Hospital											
	1	2	3	4	5	6	7	8	9	10*	11*	12*
NaCl intake, gm.	0.5	0.5	0.5	0.5	0.5	0.5	0.5	0.5	0.5	5.0	0.5	0.5
Digitoxin, mg.			0.2	0.2	0.2	0.2	0.2	0.2	0.2

Phlebotomy, cc.									300			300
Urine, cc.			200	300	320	300		400	500	180	200	450
Urea, mg.		56										
Na^+, mEq.		140								138		
K^+, mEq.		5.8								5.9		
Cl^-, mEq.		94.3								85.7	86.8	
HCO_2, mEq.		37								27	38	
Blood pH		7.25								7.08	7.28	

*Clinical state:
Tenth day: collapse; critical condition.
Eleventh day: more alert and responsive.
Twelfth day: increasing edema.
Thirteenth day: died.

On theoretical grounds use of the low sodium diet particularly when combined with diuresis of sodium as a result of administration of mercurial diuretics may be a factor in upsetting the compensated respiratory acidosis. A few cases in which electrolyte disturbances were apparently disturbed by dietary restriction of salt and administration of mercurials have been encountered at the Mayo Clinic and undoubtedly other observers also have seen this syndrome.[12]

In Case 2 depletion of sodium was associated with severe symptoms.

*Case 2.**—This patient, a woman sixty-six years old, who had had severe kyphoscoliosis since childhood, was first admitted to the hospital in December, 1949, because of congestive heart failure associated with cyanosis. Her response was satisfactory to a program of digitalization, rest and a diet poor in salt. A second admission to the hospital was necessitated in June, 1950, when she had a severe respiratory infection. During that hospitalization an acute psychotic episode occurred which in retrospect was attributed in part to "oxygen poisoning." This paradoxical reaction occasionally develops when patients with severe pulmonary insufficiency are given oxygen in high concentrations.

The final admission of the patient on November 16, 1950, was precipitated by increasing dyspnea and cyanosis. Examination revealed severe respiratory difficulty, marked cyanosis, accentuated pulmonic second sound but no edema. She had 16.0 gm. of hemoglobin per 100 cc. of blood and 5,500,000 erythrocytes per cubic millimeter. Urinalysis disclosed nothing abnormal.

Significant electrocardiographic abnormalities were right axis deviation and inverted T waves in leads II and III. Her course was marked by continued cyanosis and dyspnea with weakness. She received only 0.5 gm. of sodium in her food although less was ingested because of anorexia. Mercurial diuretics were injected on the sixth and eighth days in the hospital. On the ninth and tenth days her condition became critical in that she was more dyspneic, stuporous and showed peripheral vascular collapse with hypotension and cold clammy skin. This phase was found to be associated with uncompensated respiratory acidosis (blood pH 7.08). The response to the intravenous administration of 500 cc. of normal saline solution was dramatic. She became alert and the blood pressure returned to normal.

Three days later the patient died as a result of increasing anoxia and congestive failure. Brief data concerning this patient's course are presented in Table II.

It would appear that renal conservation of sodium is necessary to compensate for the retention of bicarbonate in at least some cases of chronic cor pulmonale and that severe dietary restriction of sodium or diuresis may so deplete the body of necessary sodium that pH of the blood is lowered to dangerous and even fatal levels. This patient had responded previously in a satisfactory manner to moderate dietary restriction of salt in so far as the edema was concerned. In her terminal illness further depletion led to plasma acid-base imbalance, as recorded in Table II.

Rigid dietary restriction of sodium for chronic cor pulmonale particularly in the absence of marked edema may represent another little recognized abuse of this therapy. The management of the patient with pulmonary insufficiency and congestive heart failure is indeed difficult. Permitting a free diet leads to retention of fluid and more severe heart failure while withholding sodium and the use of mercurials may disrupt the electrolyte pattern which remains compensated only with difficulty. With present methods the physician must feel his way along a middle pathway which may not be satisfactory in all cases.

---

*This case is to be presented in greater detail as part of a paper being prepared by Dr. Myers.[12]

Summary

The diet low in sodium, although an extremely useful measure in the treatment of cardiovascular disorders, requires rational usage. It has no purpose in the treatment of heart disease unless there is evidence that cardiac output is reduced absolutely or relatively to the point at which renal mechanisms cause retention of salt and water and the syndrome of congestive heart failure is manifest. The insistence that patients with functional cardiac disturbances and with organic cardiac ailments who have never had a decompensation follow a low sodium diet is unwarranted and may be of nutritional, psychologic and economic detriment. The degree of restriction of sodium and chloride should be graduated for the patient depending on the severity of his congestive failure. When reversible cardiac loads have been removed, restriction of salt may be lessened accordingly.

Although hypertension may occasionally respond to a low sodium diet, its use is frequently abused by its being continued indefinitely for unresponsive patients, particularly when the degree of restriction is therapeutically inadequate.

A hazard of salt restriction especially when mercurial diuretics are frequently administered is the depletion of plasma electrolytes characterized clinically by what is known as "the low salt syndrome." Although this clinical state usually occurs in the terminal phase of congestive failure, it is sufficiently often reversible by restoration of plasma electrolytes to be considered in every patient whose condition deteriorates while being treated with a diet low in sodium. A return of the patient's responsiveness to mercurial diuretics at times may be produced by prompt therapy with hypertonic saline solution and sometimes with ammonium chloride.

Rigid dietary restriction of sodium and diuresis of sodium can disturb the compensated respiratory acidosis of chronic cor pulmonale and produce dangerous depression of pH of the blood.

THE USE OF METHANTHELINE BROMIDE (BANTHINE) IN PEPTIC ULCER AND OTHER GASTROINTESTINAL DISORDERS

With Special Reference to its Abuses

R. S. YLVISAKER, M.D.
Minneapolis, Minnesota

EVER SINCE the enthusiastic reports of Grimson and his co-workers,[3,4] Banthine has come to be widely used, especially in the treatment of peptic ulcer and many reports of its efficacy have appeared in the literature. In his original trials of the drug, in order to more clearly note its effect, Grimson used no other adjuncts such as diet, antacids, et cetera, in his treatment of peptic ulcer. While this procedure was justifiable and necessary in order to evaluate a new drug properly, it has had the unfortunate effect, in some circles, of creating the impression that prescribing Banthine is all that is necessary in the treatment of peptic ulcer. This conclusion was never intended by Grimson and his co-workers and subsequent studies have served to emphasize the fact that Banthine should be considered only as an adjunct to other fundamental methods of therapy.[1,2,6,7,8]

In order to understand the proper place of Banthine in present-day gastroenterological therapeutics, it is necessary to review, briefly, the information which has accumulated in regard to the effects of this drug on the gastro-intestinal tract. All are agreed that the fundamental effect of Banthine is to inhibit the acetyl-choline liberated at the post-ganglionic parasympathetic nerve endings, thereby blocking vagal impulses. In larger doses it blocks the transmission of impulses through autonomic ganglia as well. In the usual therapeutic doses, therefore, Banthine has an atropine-like action. The remarkable features of the Banthine effect are that the wanted atropine-like action on gastrointestinal motility and secretion is dominant, while the unwanted atropine-like actions such as tachycardia, flushing, cerebral stimulation and mydriasis are minimal, or absent. These are the features that make Banthine a more useful drug than atropine in gastroenterology.

McHardy et al[6] measured salivary secretion before and after Banthine and found a marked inhibition in 86 per cent of cases. In most, this lasted only about seventy-two hours. They found no effect on esophageal secretion. Cardiospasm was accentuated by Banthine; in fact, radiologically demonstrable cardiospasm was present in 18 per cent of 200 patients with duodenal ulcer on Banthine therapy as compared with only 3 per cent before Banthine was started.

All authors are agreed on the profound effect of Banthine on gastric motility. Balloon-kymograph, x-ray and gastroscopic studies have demonstrated the ineffective peristalsis, delayed emptying, and atony of the gastric wall. Most writers refer also to the diminution in the volume of gastric secretion following Banthine. McHardy et al[6] and Winklestein[8] dispute this. The decrease in titratable free hydrochloric acid in the gastric secretion following Banthine apparently has not been as uniformly demonstrated as the decrease in volume. In addition to its effect on gastric motility and volume of secretion, Wolf et al[1] have demonstrated a definite decrease in congestion and turgor and a thinning of the gastric rugae following Banthine.

All are agreed that Banthine accentuates pyloric obstruction and should not be used when this is present. If the obstruction is transient and due to spasm or edema, it should not be used until the obstruction has been relieved by other means.

Pancreatic secretion as measured in pancreatic fistulae has been shown to be definitely decreased by Banthine,[6] and there appears to be a definitely beneficial effect on acute pancreatitis and chronic recurring pancreatitis with calculosis, although we cannot by any means speak as yet of any cures. Biliary drainage has been shown by these same authors to be increased. Drainage from ileostomies as well as from colostomies at various levels are quite uniformly decreased.

Almy et al[5] state that Banthine inhibits the motility of all portions of the resting gastrointestinal tract. With the balloon-kymograph they have shown that 100 mgm. orally prevents the hypermotility of the sigmoid which usually follows the ingestion of foods and the subcutaneous administration of urecholine and morphine sulphate, but it only partially suppresses the sigmoid hyper-

Read in The Symposium on the Abuses of New Therapeutic Agents at the annual meeting of the Minnesota State Medical Association, Minneapolis, Minnesota, May 26, 1952.

motility accompanying emotional tension during a disturbing interview. These authors as well as McHardy et al[6] speak of its clinical usefulness in some forms of hyperperistaltic diarrhea and in relief of intestinal pain. Spastic constipation, however, is not affected. The latter authors call attention to its lack of effect in various obstructive types of diarrhea and in chronic ulcerative colitis.

In addition to these actions which, in general, can be considered to have some clinical usefulness, there are side-effects which may at times make the use of Banthine uncomfortable for the patient or constitute definite contraindications to its use. The absolute contraindications can be stated as being: (1) bladder neck obstruction; (2) coronary insufficiency and cardiac decompensation; (3) glaucoma; (4) achalasia or cardiospasm; (5) pyloric obstruction, and (6) adynamic ileus. Bladder retention is usually thought of as occurring only in older men with enlarged prostates. It, however, has also occurred in women, probably due entirely to the induced atonicity of the bladder wall. Whether or not an undiscovered cicatricial urethritis could be a factor is difficult to say. Other side-effects such as visual disturbances, dryness of the mouth, and constipation are usually transient or so minor that they need not be given serious consideration. Very occasionally they may be distressing enough to the patient to warrant either decreasing the dose or discontinuing the drug entirely. On one occasion very severe dysphagia and pain along the esophagus developed which did not disappear until about five days after the discontinuance of the drug. Banthine should not be used in the immediate preoperative period as it will almost invariably lead to postoperative bladder retention.

It can now be stated that Banthine has been shown to be the most potent and useful antispasmodic agent yet developed. With special reference to its use in *duodenal* ulcer, most writers are agreed that it constitutes a valuable addition to our armamentarium if used together with other accepted methods of therapy. McHardy and his group[6] are the only writers I have encountered who state that their percentage of good results has been no greater with Banthine than without. Others agree that even in the so-called intractable cases, provided pyloric obstruction is not present, the addition of Banthine results in symptomatic relief and disappearance of the crater in the vast majority. It is still too early to say how permanent these results will be. Recurrences of ulcers while on therapy have been reported. In some of these, treatment has been inadequate. In general, the results are still on the positive side.

The results of therapy with Banthine in *gastric* ulcer have not been so convincing. A few patients seem to respond well, but, from all reports, the majority are very little if at all benefited. Excellent relief has been reported in a few cases of hyperacidity syndrome, marginal ulcers and peptic ulcers in hiatus hernia.[2]

The misuse and/or abuse of Banthine can probably be grouped under four main headings:

1. *Expecting the drug to accomplish more than our present experimental data would warrant.* Under this heading is included the tendency simply to hand the patient a prescription for Banthine and expecting thereby a cure for his ulcer. It must be remembered that, according to our present knowledge, the effect of Banthine on the course of duodenal ulcer perhaps is brought about entirely by its profound effect in suppressing gastric motility and its moderate effect in decreasing the volume of gastric secretion. It still behooves us to see that the patient obtains the needed rest, that his life be regulated so as to avoid tension and strife as far as possible, and that proper diet and, in certain cases, at least, antacids be administered so as to provide a medium which is conducive to the healing of the ulcer.

2. *Improper use of the drug.* It must be remembered that the effect of one dose of Banthine does not last longer than four to six hours, so that the drug must be administered at least every six hours throughout the twenty-four hour period, and especially at night when there is nothing in the stomach to buffer the effect of the acid peptic juice on the ulcer. This must be continued until there is evidence of complete healing of the ulcer. In other words, one tablet two or three times daily is not adequate. Complete therapeutic trial cannot be said to have been carried out until 100 mgm. (2 tablets) have been given every six hours. In some cases this may have to be increased to every four hours. Wolf states that during periods of stress it may be necessary to increase the dose temporarily. The prescribing of Banthine to be taken only as pain comes on cannot be condoned.

BLOOD GROUP FACTORS

Part II. Rh Sensitization

G. A. MATSON, PH.D., and R. W. KOUCKY, M.D.
Minneapolis, Minnesota

THE discovery of the Rh-Hr system of blood groups and the recognition of sensitization to these factors have constituted one of the important medical contributions of the past decade.

The general principles of intra-group sensitization were correctly elucidated by the early workers on Rh,[10,11,12,18] and in the intervening years these principles have been changed very little. Individuals who lack certain blood group antigents, if inoculated with them, may react to these substances as though they were foreign proteins. The initial exposure of the individual to the foreign blood factor produces no reaction but may stimulate the formation of antibodies. Once the antibodies have been produced, subsequent introduction into the blood stream of the specific blood antigen will produce untoward antigen-antibody reactions. Exposure of the body to foreign blood group antigens can be accomplished in either of two ways: (1) by the introduction of incompatible blood, either as transfusions or as subcutaneous, intramuscular or intraperitoneal injections, or (2) by pregnancy, in which foreign blood group antigens from the fetus are introduced into the mother by way of the placenta. First we shall consider sensitization produced by repeated transfusion.

Repeated Blood Transfusions

If repeated transfusions of Rh-positive blood are given to an rh-negative recipient, that person is likely, sooner or later, to produce Rh antibodies. This antibody producing response of rh-negative persons to the Rh antigen shows considerable individual variation. Following such repeated transfusions, about 50 per cent or more of the recipients develop some degree of demonstrable sensitization,[4,12] whereas a small proportion fail to show any sensitization even after several transfusions. Inoculations of volunteers for the purpose of developing anti-sera is successful to some degree in the great majority of cases.[19] It seems clear that sensitization is very frequent after transfusion of Rh-positive D (Rh_0) blood to an rh-negative d (Hr_0) recipient. It can be concluded from this that every precaution must be taken to avoid the transfusion or injection of Rh-incompatible blood.

Sensitization Due to Pregnancy

On the other hand, sensitization of rh-negative (cde) mothers by an Rh-positive fetus is relatively uncommon.[2,17] In one series of antibody studies[8] on almost 4,000 rh-negative women with Rh-positive husbands, the incidence of sensitization was 1 in 19. Even making appropriate allowance for pregnancies yielding rh-negative children and for first pregnancies (it generally requires at least one pregnancy to sensitize a mother), the estimated incidence of sensitization in this study still was not over 1 in 10. These observations suggest the moral obligation of everyone teaching the principles of Rh sensitization to point out (1) that transfusion or injection of Rh-incompatible blood results in a high frequency of sensitization, and (2) that pregnancy in rh-negative women produces sensitization on the average in only about 1 in 20 women.

This ratio does not apply, however, to rh-negative women who have received previous transfusions or injections of Rh-positive blood. Because of the high incidence of sensitization following such transfusions, these women may already be sensitized to the Rh antigen at the time of their first pregnancy. Before we had knowedge of the Rh factors, transfusions with incompatible Rh blood were unfortunately not uncommon. It is now well known that rh-negative women who have previously received a transfusion of Rh-positive blood are more than likely to produce affected babies in future pregnancies.[5,13] Women who might have given birth to several normal children may have all their chances of future normal childbearing destroyed by a transfusion or even an intramuscular injection of Rh-incompatible blood.[1] Intramuscular injection of unmatched blood into infants should be discontinued.

Rh-Hr Factors

As discussed in Part I of this review, the Rh-Hr system consists of three factors. The Brit-

TABLE I. COMMON GENOTYPES AND THEIR PERCENTAGE DISTRIBUTION AMONG AMERICAN WHITES.

Genotype	Percentage (Approximately)
CDe/cde	32
CDe/CDe	17
cde/cde	15
CDe/cDE	14
cDE/cde	12
cDe/cde	2
cDE/cDE	2
CwDe/CDe	1
All others less than 1% each and less than 5% total.	

ish CDE system of nomenclature enables physicians to better visualize the relationship of the three Rh genes and their family of variants or allelomorphs. In order to understand the somewhat complex Rh-Hr nomenclature, it is essential for the physician to fix in his mind that the Rh "positive" element is expressed in the British nomenclature by the capital letter, e.g., C (rh′) D (Rh$_o$) and E (rh″), whereas the rh "negative" or Hr element is expressed by the corresponding small letter, e.g., c (hr′), d (Hr$_o$) and e (hr″). He should have available in his library or office desk the table of frequencies for at least the most common of the different Rh patterns (genotypes) (Table I).

Sensitization to Rh-Hr

The most commonly occuring Rh sensitization is in d (Hr$_o$) women exposed to D (Rh$_o$) antigen. From Table I it can be seen that the complete genotype of the great majority of these d (Hr$_o$) women is cde/cde. They are, therefore, rh-negative not only to D(Rh$_o$) but also to the other two specificities of the Rh factor. Sensitization of C (rh′) negative and E (rh″) negative individuals to the corresponding positive C and E factors occurs frequently in completely rh-negative individuals (genotype cde/cde).

Since approximately 85 per cent of individuals are positive to D (Rh$_o$), 60 per cent are positive to C and 15 per cent are positive to E (Table I), it follows, therefore, that 85 per cent of cde/cde women will have husbands positive to D, and, in addition, about half of these husbands will be positive also to C and about one-sixth will be positive also to E. It can be seen, therefore, that commonly cde/cde mothers are exposed to multiple antigens, e.g., D plus C (CD) or D plus E (DE), and may form several antibodies simultaneously (Table II).

Sensitization of rh-negative (cde/cde) individuals is the most common, but many other types of sensitization do occur. In all cases, the same principle holds: a person is sensitized to a blood factor which he does not possess—homozygous c (hr′) individuals can be sensitized to C (rh′); C (rh′) to c (hr′); d (Hr$_o$) to D (Rh$_o$); D (Rh$_o$) to d (Hr$_o$); e (hr″) to E (rh″); and E (rh″) to e (hr″). Furthermore, all of the more recently discovered Rh allelomorphs C^w, C^u, c^v, and D^u and the other blood factors, such as the MN, Kell, Lutheran, Duffy, Kidd and the Lewis, may be implicated in the same way. In fact, most of the Rh allelomorphs and most of the other blood group factors were discovered because of sensitization by multiple transfusions or pregnancy. However, the susceptibility to such sensitization varies tremendously and appears to depend both upon the antigen involved and upon the individual. In the case of some antigens the susceptibility is so slight as to be almost nonexistent. The reason for such variation is susceptibility to the various blood group antigens is not entirely clear.

As previously stated, the most susceptible to sensitization are d (Hr$_o$) individuals exposed to D (Rh$_o$). However, in pregnancy, this most common form of sensitization occurs only in about one in twenty exposures. Almost equally susceptible is a cd (Hr$_o'$) individual exposed to CD (Rh$_o'$) resulting in sensitization to both C (rh′) and D (Rh$_o$). Curiously a cd (Hr$_o'$) or a cD individual exposed to CD (Rh$_o'$) rarely develops sensitization to C (rh′) only. Sensitization to E is uncommon and even more rare is sensitization of C or E individuals to the negative C (c) or negative E (e). The most striking example of apparent contradiction is in the d-D relationship. As stated above, a d(Hr$_o$) person is relatively susceptible to sensitization by the D (Rh$_o$) antigen but a D (Rh$_o$) person is extremely resistant to sensitization by the d (Hr$_o$) antigen. Only three instances have been reported in the entire literature.[6,7,9]

Physicians often ask the question, "How can an Rh-positive woman become sensitized?" There are three ways in which this occurs. In the determination of Rh, the Rh antiserum used as a screening serum is an anti-D (anti-Rh$_o$) serum. This is the correct serum to use since bloods negative to this serum almost always (about 88 per cent) have the genotype cde/cde, that is, they are negative to all Rh specificities. However, bloods positive to this anti-D serum often are

CDe, cDE, or cDe, and therefore are negative to C (rh') or E (rh'') or both, even though they are positive to D (Rh_o). Occasionally as stated previously some of these women positive to D (Rh_o) but negative to C (rh') or E (rh'') can develop sensitization to C (rh') or E (rh'').

TABLE II. EXAMPLES OF RH INCOMPATIBILITIES

Mother or Recipient	Fetus or Donor	Antibody Formed	Frequency
cde/cde	CDe/CDe or CDe/cde	Anti-D or Anti-D & Anti C	Common
cde/cde	cDE/cde	Anti-D or Anti-D & Anti E	Common
cDE/cDE	CDe/cde	Anti-C	Rare
cde/cde	cDE/cde	Anti-E	Rare
CDe/CDe	cde/cde	Anti-c	Rare
cDE/cDE	cde/cde	Anti-e	Rare
CDe/CDe	cde/cde	Anti-d	Extremely rare

Another mode of sensitization is even more uncommon but does occur. The individual positive to any or all of the three specificities of Rh, for example, can become sensitized to the c (hr') or e (hr'') factors and presumably very rarely to the d (Hr_o). This is the so-called Hr sensitization.

Finally, the Rh-positive individual may be sensitized by pregnancy or by transfusions involving blood factors other than the Rh, such as the A, B, Kell, Duffy, Lutheran or others.

Table II lists various combinations of Rh genotypes as examples to illustrate possible Rh incompatabilities and the antibodies which might be formed. The table is arranged in the approximate order of the susceptibility to sensitization.

Laboratory Reports

When sensitization has occurred and antibodies are present, it is customary to measure the concentration of the antibody in terms of titer, i.e., the number of times the serum can be diluted and still produce visible evidence of agglutination. Immunologists often express not only the titer but the strength of the agglutination of each dilution. This is an expression of the degree of clumping and is of minor significance to clinicians. However, if a case is to be reported in the literature the inclusion of the expression is worth while. An example of a complete expression is "titer, 1:32," followed by the designation of the degree of clumping in each dilution: "33321000," which indicates 3-plus agglutination in the first tube or 1:2 dilution of serum, 3-plus in the second or 1:4 dilution and so on.

As stated in Part I of this review, the study of rh-negative mothers should include a determination of the father's genotype. If the father is heterozygous Rh positive and therefore carries also an rh-negative (Hr) gene, half of the children can be rh negative. If he is homozygous Rh positive, all of the children will be Rh positive.

A typical example of a report of a complete study of an rh-negative mother, disregarding for the time being the albumin and Coombs' titrations, is as follows:

"Mrs. X is rh negative (cde/cde) and Mr. X is Rh positive to both C (rh') and D (Rh_0) and is c (hr') positive and is therefore heterozygous to C (rh'). His most likely genotype is CDe/cde, and if this is so, there is an even chance that children born to this union will be rh negative and therefore normal so far as Rh incompatibility is concerned.

"The serum of Mrs. X shows that she is sensitized to both the D (Rh_0) and C (rh'). The anti-D titer is 1:32; 33321000, and the anti-C titer is 1:4; 21000000."

With only minor variations, the above illustration is typical of many reports. In many cases the father's genotype will be CDe/CDe, in which case he is homozygous and all the children will be Rh positive. Or, his genotype may be cDE/cde in which case the rh-negative mother may be sensitized to E (rh'') as well as D (Rh_o).

Modes of Action of Rh Antibodies

It is now well known that there are several types of Rh antibodies. These are identified by differences in their mode of action upon the specific antigen (Rh-positive red cells) when suspended in different media. The three types of antibodies for which tests are usually made are commonly called "saline," "albumin" and "Coombs" antibodies.

Originally the accepted method of carrying out a crossmatching of blood was to use a saline suspension of donor's red cells mixed with equal parts of the recipient's serum. It was to be expected that this same method would be used in the earliest Rh studies. Obviously the first type of antibody to be identified was therefore the saline antibody. Many instances of Rh sensitization were demonstrated by this method. But frequently negative mothers, unquestionably sensitized because they gave birth to erythroblastotic babies, did not have antibodies demonstrable by this method. Many physicians can recall in the early days of Rh studies patients who, according to laboratory tests, showed no evidence of sensitization but who, nevertheless, delivered babies obviously afflicted with erythroblastosis. Occasionally, too, a recipient of a "perfectly cross-matched" transfusion died of a hemolytic reaction.

Laboratory workers soon modified their methods. By substituting for saline either human serum or a concentrated solution of albumin in making the suspension of red cells, many more cases of sensitization were demonstrated. This high protein method, developed originally for study of Rh antibodies, has now been included in transfusion techniques and is today the accepted procedure in all crossmatching of bloods for transfusion. This method is not only a more sensitive procedure but it has uncovered a new type of antibody. Many studies seem to show that the two antibodies are different both in chemical structure and biologic activities. The most easily demonstrated difference between the two antibodies is that one is active in a saline medium and the other requires an albumin medium; hence the terms saline and albumin antibodies.

An incidental characteristic of the albumin antibody is worthy of mention because this property yielded the term "blocking antibody," which appears to be so firmly fixed in the Rh literature. Albumin antibody, if mixed with Rh-positive red cells suspended in saline, cannot agglutinate them, but apparently this antibody adheres to and coats and blocks the cells in some way so that they no longer can be agglutinated, as they otherwise should be, by saline antibodies; hence the term, blocking antibody. Another term synonymous with albumin antibody or blocking antibody is "incomplete antibody." A term employed as synonymous with saline antibody is "agglutinating antibody." The serum sold commercially as "test-tube" serum is a saline antibody and that which is sold as "slide" serum is an albumin antibody.

Up to this point have been mentioned only saline and albumin (sometimes called blocking) antibodies.

In studies on evidence of pathogenesis of erythroblastosis, it has been found that the anti-human, globulin serum tests of Coombs, Mourant and Race[3] is an important serological adjunct to the investigation of immunization whether by pregnancy or transfusion.

This test is now widely used in general laboratory work. Coombs postulated that if proper red cells (antigen) are mixed with corresponding antibody, the antibody would adhere to the surface of the red cells even if agglutination did not occur. Since antibodies are modified globulins, it follows that the red cells exposed to the antibody should now be coated with a layer of the modified human globulin. Coombs prepared an anti-human globulin serum by injecting rabbits with human globulin. When he added this anti-human globulin rabbit serum (now known as Coombs' serum) to the treated red cells coated with human globulin, agglutination promptly occurred.

The Coombs test gives a positive reaction for any type of antibody that fixes itself to red cells. Sensitized mothers give a positive reaction regardless of whether the antigen involved is the Rh factor or one of the others, such as the Duffy, Lutheran, Kidd, Lewis or others, providing (and this is a big technical problem in small laboratories) that proper test cells are available. Antibodies of unknown origin which fix themselves to red cells causing hemolysis and thereby producing hemolytic anemias can be demonstrated by the test. Transfusion reactions due to weak antibodies not demonstrated even by the improved methods of cross-matching may be identified by the Coombs test. Erythroblastosis can be differentiated from other types of anemias and jaundice of the newborn by means of the test. It is very probable that all of the possibilities of the test have not yet been explored.

It is common practice in Rh laboratories to do all three types of tests, namely, saline agglutinating, albumin agglutinating and Coombs, on every specimen for which Rh antibody titrations are indicated. The titer of these antibodies follows a fairly consistent pattern. Both the albumin titration and the Coombs titration demonstrate not only their own specific antibody but also all of the saline antibody so that the values of each of these two titers should be at least equal to the saline titer; for example: saline 1:64, albumin 1:64, Coombs 1:64. Not infrequently the saline antibody is relatively decreased or disappears; for example: saline nil, albumin 1:64, Coombs 1:64. Rarely both saline and albumin antibodies are low or absent and only the Coombs titer is present; for example: saline nil, albumin 1:16, Coombs 1:64. Occasionally the Coombs titer appears to be lower than the others. This probably is due to technical errors. As will be discussed later, the relative and not the absolute levels of these titers may be of some clinical significance.

The determination of sensitization to the various allelomorphs of the Rh system or to the other blood group antigens may be a long and tedious process. Study of a patient for one of the uncommon types of sensitization consists of setting up the serum against a large "panel" of known red cells. Some of these studies take several months to complete. To do such studies, the worker must have available an adequate "panel" of known sera and test cells. To assure the availability of known test cells and in view of the fact that cells are perishable, the worker must have at hand a list of people of selected groups who can donate of their blood as it is needed. A complication of this procedure comes from the fact that some genotypes are rare in the general population. Obviously these are not procedures one can request of the average hospital laboratory. Even in a laboratory devoted exclusively to sensitization studies such mass studies are not possible as routine procedures but rather come in the category of research. Such studies are carried out only when the usual routine tests are negative and the history given to the laboratory indicates that definite maternal sensitization or a true hemolytic transfusion reaction has occurred.

Routine Rh Studies

Physicians commonly ask: "What program of Rh studies should be routinely carried out in obstetrical practice?" It is difficult to recommend a program equally acceptable to all physicians. Some physicians prefer to study each individual baby for evidence of erythroblastosis and to carry out maternal Rh studies only in selected cases. Many physicians request of the Rh laboratory tests to determine the Rh group of all pregnant patients and tests on the serum of rh-negative ones during pregnancy as a routine to detect as early as possible the development of sensitization to Rh. At least two determinations for Rh antibodies are usually called for: one at the time of the woman's first appearance at the physician's office or the antenatal clinic; the other about six weeks to a month before the expected date of delivery. Other physicians request antibody determinations at the time of the first visit of the rh-negative woman and then every thirty days from the fifth or sixth month of pregnancy until term. The rationale for this early test is that the finding of antibody early in pregnancy indicates that the woman had become sensitized by an exposure to the antigen at some time previous to the current pregnancy. Antibodies resulting from an initial sensitization due to the current pregnancy are seldom detectable before the fifth month. The following outline presents a sequence which can be modified by physicians to suit their own needs.

I. The first time the expectant mother presents herself for examination, take a specimen of blood for Rh determination.
  1. If blood is found to be Rh positive, proceed no further unless there is history of previous erythroblastotic babies. In these rare instances arrange for special studies (ABO, Rh subgroups, MN, Duffy, Kell, et cetera).
  2. If blood is rh negative, proceed to step II.

II. If blood of expectant mother is rh negative, take specimen of blood from husband for Rh determination:
  1. If husband's blood is rh negative, proceed no further.
  2. If husband's blood is Rh positive, determine whether he is homozygous or heterozygous, and proceed to step III.

III. If husband is Rh positive, take specimen of wife's blood to be tested for presence and concentration of Rh antibodies. If—
  1. Wife is Gravida 1 and antibodies are absent, send another specimen of her blood to laboratory at about the thirty-fourth week of pregnancy for antibody titration.*
  2. Wife is Gravida 1 and antibodies are present, it likely means that she has been previously exposed to the Rh antigen by transfusion, by intramuscular inoculation of blood or by earlier unrecorded pregnancy.** Send specimen of her blood to laboratory at sixth and eighth months of pregnancy for confirmation of the sensitization.
  3. Wife is multipara with normal prior babies and antibodies are absent, send specimen of her blood to laboratory at end of fifth, seventh and eighth months of pregnancy for further antibody titrations.***

---

*The statement that hemolytic disease of the newborn is rare in first pregnancies does not apply to women who have received previous transfusions or intramuscular injections of blood even in infancy. They may already be sensitized to the Rh antigen at the onset of their first pregnancy. It is now known that rh-negative women who have previously received any transfusions of Rh-positive blood are more likely than not to produce an affected child in any subsequent pregnancy.[5,13]

**It must be remembered that a pregnancy which terminates in an abortion, say at ten to twelve weeks, may be enough to sensitize a woman. Women who claim to be pregnant for the first time may be overlooking miscarriages manifested only by missed periods.[14]

***It is very important to be forewarned of the first erythroblastotic baby. This one probably can be saved and may be the last viable child of this woman.

4. Wife is multipara with prior erythroblastotic babies and,
   (a) husband is heterozygous, send blood for antibody studies at fifth, seventh and eighth months. A stationary titer indicates an rh-negative baby which should be normal.
   (b) husband is homozygous, all the children will be positive and the level of the antibody is of little value. Send her blood for study according to the individual circumstances: for the record or for academic interest. Blood from highly sensitized women is needed desperately for processing into diagnostic sera.

Interpretation of Laboratory Results

The interpretation of the degree of Rh antibody titer in the serum from the pregnant woman is indeed difficult. Our own findings convince us that there is little correlation between antibody titer as such in the mother's serum and the severity of symptoms of hemolytic disease in the newborn. The titer often shows little change during pregnancy even when there is an Rh-positive fetus *in utero*. Then again, it happens that there may be a small increase in the titer of the Rh antibody even though the fetus *in utero* is rh negative. If, however, the titer of antibody increases markedly, say twentyfold or more, it can be considered likely that the infant *in utero* is Rh positive.

The fluctuations in the Rh antibody titer are not always a safe guide to judge the prognosis to the baby. It is not altogether clear why this should be so. Quite likely the titer represents to some extent the amount of antibody present in excess of that absorbed by the fetus. One woman may form only small or moderate amounts of antibody but if the baby absorbs little or none, the antibody accumulates in the mother's circulation and produces a rising titer. Another woman may produce larger amounts of antibody which is largely absorbed by the fetus. In such a woman antibody is being withdrawn from her circulation and the titer may rise only slightly, remain stationary or actually fall. Often the titer falls sharply late in pregnancy, probably because the increased fetal volume absorbs large amounts of the available antibody. Generally speaking, however, a consistently high titer—and especially a rising titer—often portends a grave prognosis.

Perhaps some reliance might be placed upon the relative values of the saline and albumin antibody titers. The physician need not concern himself with the complex and still uncertain physicochemical differences between the two antibodies. Suffice it to say that there is evidence to indicate that the earlier and presumably less severe stages of sensitization produce a higher ratio of saline antibody relative to the albumin type. In later and presumably in the more severe stages, the saline antibody decreases or disappears and the albumin antibody titer is relatively high. In general, one would expect a better prognosis if the titer is "saline 1:64, albumin 1:64, Coombs 1:64" than if the titer is "saline nil, albumin 1:64, Coombs 1:64."

The time during the gestation period in which antibody appears seems also to be important. Generally speaking, the earlier in pregnancy that the mother becomes sensitized, the graver the prognosis for the infant.

By far the most important guide in judging the prognosis for the unborn child is the mother's past record. Sensitization of the Rh type is a progressive process. Once a mother has reached the stage where the fetus is critically affected, the outlook for future normal Rh-positive children is very poor. For this reason, it is extremely important that erythroblastosis of moderate degree be promptly recognized and actively treated. It is very probable that this moderately ill child is the last Rh-positive child of this mother which can be saved.

In cases of these highly sensitized women, the homozygous or heterozygous state of the husband becomes important (see item III-4 of the above suggested outline for prenatal studies). Because of the reciprocal relationship of Rh and Hr types, the determination of Hr becomes an important laboratory adjunct in prognosticating, within limits, the chances of producing Rh-positive and therefore erythroblastotic babies or rh-negative and therefore normal offspring in future pregnancies in families where congenital hemolytic disease has occurred. However, since at present the available supply of Hr antiserum is limited to anti-c (anti-hr′) only, the clinical application of the Hr factor must be restricted at present to testing directly for homozygosity and heterozygosity of types CDe (Rh_1) and Cde (rh′) individuals. Through population studies, however, with suitable antisera, it has been possible to determine the frequency of gene arrangements on chromosomes and the incidence of the Rh and Hr types. From tables that have been constructed, e.g. Table I (abbreviated form), it is possible for the laboratory worker to calculate the chances of a man being homozygous or heterozygous Rh positive in Rh types where the anti-c (anti-hr′) serum cannot prove it directly; and therefore predict the chances that a sensitized mother would have of producing normal offspring fathered by her Rh-positive husband.

Laboratory Tests on Infants

The direct Coombs test is one which is of proven value at this time. It requires a minimum of equipment and results are obtained in about fifteen minutes. The application of Coombs serum to cord erythrocytes offers a means of differential diagnosis between erythroblastosis and such confusing conditions as other types of jaundice and anemia of the newborn.

Although the cord is a convenient source of blood for laboratory study, there is danger of contamination by mucus. The cord should not be squeezed unnecessarily during the collection of the blood. Rh tests, grouping, and Coombs tests on cord blood are reliable. Hemoglobin determination, icterus, and bilirubin studies are distorted by clotting, hemolysis and contamination by mucus. These should be confirmed by study of peripheral blood.

The laboratory tests ordinarily available to pediatricians are as follows:

I. Rapid centrifugation of cord blood collected into a dry tube containing oxalate or heparin so that supernatant plasma may be examined grossly for presence of icterus.
II. Slide test for Rh to determine rapidly Rh type of infant.
III. If infant is Rh positive, direct Coombs test on red blood cells of infant to determine if cells are coated with Rh antibody.
IV. Hemoglobin determination on infant's blood.
V. Other less urgent tests:
  1. Erythrocyte count and differential.
  2. Rh antibody titration on blood serum from infant.
  3. Bilirubin content more accurately determined.

Preparation of Transfusions

Several of the newer studies on blood group antigens and antibodies find ready application in transfusion work.

The principle of the albumin (high protein) method of cross-matching of blood is unquestionably sound. Workers are continually searching for improvements in this method. Just as the albumin method of Rh antibody study has demonstrated many more cases of sensitization than was possible by the older saline method, so this same method applied to cross-matching of blood is far more reliable than the original saline method. The procedure is recommended without reservation, but it may be expected that refinements may be forthcoming.

The use of the Coombs test as an adjunct to the cross-matching of blood is proving of considerable value. As already discussed, saline and albumin types of antibodies may disappear or be of such low titer that they are almost imperceptible, yet the Coombs test can be strongly positive. Therefore, in a patient who is having reactions to transfusions, the next transfusion should be cross-matched by the albumin method, and if this is negative, the cross-matching should be still further studied by means of the Coombs test. The same precaution can be followed in preparing transfusions for women who have borne erythroblastotic babies or in patients who have had many prior transfusions.

The selection of rh-negative blood for sensitized rh-negative recipients should be done with exceptional caution. Since laboratories ordinarily have no knowledge of the patient's prior clinical record, the physician has the obligation to warn the laboratory; or better yet, the laboratory should regard all rh-negative patients as dangerous recipients.

Patients negative to the anti-D serum generally have the genotype cde/cde and as already stated are often sensitized to C or E as well as D. Therefore, the blood administered to rh-negative patients must be tested not only with anti-D serum, but also with anti-C and anti-E serum. Up to 2.42 per cent of the population have the genotype Cde/cde[20] and up to 1.3 per cent have the genotype cdE/cde[15] (depending on the racial distribution in the population).

The problem, however, is even more complex. In about 1.6 per cent of the population the allelomorph D^u reacts weakly or not at all with anti-D serum,[16] and many individuals having this D^u variant are typed as rh negative (cde). Such mistyped blood given to sensitized cde individuals can produce serious reactions. Generally the cross-matching, if done by the high protein method, should give some suspicion of incompatibility. If there is any question regarding the cross-matching, or, as stated above, if the recipient is known to be sensitized, the extra precaution of a Coombs test is indicated.

Summary

1. The basic principle of blood group sensitization has been modified very little since the initial work on the Rh factor. Individuals inoculated with blood factors which they themselves do not possess may react to them as though they were a foreign antigen.

2. Rh-negative (d) individuals given positive blood by transfusion or injection develop sensitization in most instances. On the other hand, sensitization by pregnancy in rh-negative individual occurs in only 5 per cent of the cases. An injudicious transfusion or injection of Rh-positive blood into an rh-negative woman may militate against the possibility of her ever giving birth to normal babies.

3. The Rh allelomorphs other than D and various other blood factors more recently discovered can cause sensitization, but there is marked variation in the incidence of sensitization to the various factors. Anti-C and anti-E sensitization are relatively common but only when combined with anti-D sensitization. The other allelomorphs and blood group antigens cause sensitization only occasionally. These latter factors do not need to be investigated in routine transfusion or Rh work but must be investigated when the usual causes of erythroblastosis and hemolytic transfusion reactions have been excluded.

4. Rh antibodies are of three types: saline, albumin and Coombs. The saline antibody receives its name because it will agglutinate red cells suspended in saline. The albumin antibody will agglutinate red cells only if they are suspended in an albumin medium. The Coombs test, which identifies the Coombs antibody, is a very valuable procedure applicable to many other types of laboratory studies. All its possibilities still may not have been developed.

5. Routine Rh work on obstetrical patients usually involves study of the D-d factors only. If, however, sensitization is definitely known to be present, as indicated by an erythroblastotic baby, and is not accounted for by D-d incompatibility, other blood factors must be investigated. Such studies may be quite involved.

6. A complete Rh study of an rh-negative woman includes tests for the three types of antibodies, titration of each, tests for coincident C or E antibodies, and the genotype determination of the husband to identify his homozygous or heterozygous state.

7. A sequence of Rh studies depending upon the parity of the mother and her previous clinical record is presented.

8. Emphasis is put upon identifying the first appearance of sensitization during the child-bearing period. It is believed that the one or two pregnancies in which the sensitization cycle is just starting may yield mildly affected children which can be saved by proper treatment.

9. Antibody studies in rh-negative women with advance sensitization is of value only if the husband is heterozygous and rh-negative children are therefore possible. The Rh status of the unborn infant can be forecast by such studies with acceptable accuracy.

10. Prognosis should not be based solely upon levels of Rh-antibody titer. Such levels probably represent the excess of antibody above that absorbed by the fetus and do not necessarily measure the amount actually combining with the infant's tissues. However, the relative amounts of saline and albumin antibody may be of prognostic value. The saline antibody appears to be less harmful, and the prognosis is better if this type predominates. The time during pregnancy at which sensitization occurs appears to have prognostic importance. The best prognostic guide is the mother's past history. Rh sensitization is progressive and once a mother has reached the stage of advanced sensitization, the chances for further normal children are almost non-existent unless the father is heterozygous and the next child is rh negative.

11. An increasing amount of the data collected by the Rh worker is being applied to general transfusion work. An example at point is the high protein method of cross-matching which is now the accepted method in many laboratories. The significance of the D^u allelomorph is another example. This allelomorph often gives a weak or negative reaction to anti-D sera. Such a D^u blood is often grouped as rh negative (d) and if transfused into a sensitized cde patient may give a serious reaction. The Coombs test may be used as an adjunct to the cross-matching of blood for recipients who have received many transfusions or for rh-negative women known to have borne erythroblastotic babies.

AMNIOTIC FLUID EMBOLISM

STANLEY P. STONE, M.D., and R. W. KOUCKY, M.D.
Minneapolis, Minnesota

THE following case is typical of the relatively rare condition known as amniotic fluid embolism. The case is of special interest because it contributes to our understanding of the mechanism of this obstetrical accident.

Case Report

The patient was a gravida 4, with two living children. One child had died during delivery because of a prolapsed cord and breech presentation. In 1947 the patient apparently had an early abortion, followed by irregular bleeding which ceased after a curettage.

In June of 1949, she again became pregnant. Except for a mild anemia, the pregnancy was uneventful. On April 18, 1950, she was admitted to Fairview Hospital about four hours after the onset of labor. The cervix was dilated to 2 cm. Labor progressed slowly. At 2:00 p.m. she was given 75 mg. of demerol and 1/200 gr. of scopalomine. Pains became more regular, and at 2:45 p.m. she was taken to the delivery room. The cervix was now dilated to 3 cm. She was nauseated with her pains, and twice she vomited small amounts of greenish liquid. She was drowsy and slept between pains. At 3:15 p.m. she had an involuntary defecation and urination. At 3:53 p.m. the nurse made the following entries: "Patient turned on side by herself. Became rigid. Head thrown sharply back. Very cyanotic. Does not respond. Patient very cyanotic; respirations gasping. Pulse imperceptible. B. P. 130/60." Various attempts at stimulation and resucitation, including prolonged artificial respiration, were unsuccessful.

An autopsy examination was conducted at 8:00 p.m. of the same day. The lungs were moderately heavy and edematous. The left lung weighed 450 grams and the right weighed 440 grams. The lower lobes were partially atelectatic. The bronchi and the trachea showed no foreign material, and the pulmonary arteries showed no emobli. There was no air in the heart.

Examination of the external surface of the uterus showed no suggestion of trauma, hemorrhage, or other changes. The uterus contained a normal term female infant, which lay with its back anterior and its head down. The membranes were ruptured. About 200 cc. of thick green fluid remained in the uterine cavity, and this was contained in the interspaces between the legs and the arms and in the space around the neck. The fetal head was in the lower uterine segment. The membranes had separated along the lower part of the uterine wall and the muscle of the lower uterine segment was bare for distances varying from 2 to 4 inches. On the exposed posterior wall of the uterus, a small depression was observed, which, when explored with the tip of a forceps, proved to be a sizeable channel. A rubber catheter, such as is used for male catheterization, easily passed through the opening into the interior of the uterine wall and appeared in the large veins in the right broad ligament. Blood recovered from the right common iliac vein and from the lower vena cava, when spread out on the white porcelain tabletop, showed numerous flakes of green mucoid material. One of the larger pieces was about 1 mm. in diameter and 5 or 6 mm. in length.

Approximation of the fetus into its original position within the uterus indicated that the opening into the uterine vein was in about the position of the space formed by the fetal neck and the small parts.

Microscopic study showed approximately the same picture in all the lobes of the lungs. In every section there were many small arterioles and capillaries containing foreign material made up of squamous epithelial debris, amorphous material, mucus and leukocytes. A few foci of leukocytes were present in the lung parenchyma which had the appearance of beginning exudation.

One receives two impressions from this microscopic study of the lungs. The early exudative reaction suggests that the embolism of amniotic sediment was not a terminal explosive event but had been going on for many minutes or even hours. Perhaps the patient's nausea, vomiting, involuntary bowel movement and involuntary urination indicated the beginning of the embolism. The second impression is that the degree of embolism produced only moderate vascular occlusion and that death was due to causes other than mechanical obstruction. It is very likely that "shock" similar to that caused by foreign material in a blood transfusion may have been the final cause of death.

In the past twelve years, there have been seven other maternal deaths at Fairview Hospital; cardiac decompensation associated with old rheumatic valve lesions (two); heart failure associated with lues (one); fulminating eclampsia (one); abdominal complications following cesarean section (one); and pulmonary embolism (two). Unfortunately neither of these two cases of maternal death attributed to pulmonary embolism came to autopsy, and the cause of the deaths could not be confirmed.

The first of these so-called embolic deaths occurred in 1940. The patient, a primipara, was admitted on June 18, 1940, in the care of Dr. M. P. Baken. She was delivered of a normal female infant after an eight-hour labor. The baby was born at 11:05 a.m., and the placenta was expressed at 11:09 a.m. At 12:00 p.m.

the blood pressure was 100/68. At 2:00 p.m., the nurse recorded that the patient was cold and clammy. There was no bleeding and the blood pressure was 100/68. At 3:00 p.m. the pulse was 82 and was weak. The patient was cold and perspiring, and the blood pressure was not obtainable from this time on. The hemoglobin was 74 per cent (Sahli) and the red blood cell count was 3.7 million. At 5:00 p.m., the patient was nauseated, and at 7:00 p.m. she vomited. At 8:00 p.m. she complained of shortness of breath and pain in the abdomen. At 8:15 marked dyspnea set in, and respirations became difficult and labored. The patient died at 8:50 p.m. Death occurred eight hours and fifty-five minutes after delivery and six hours and fifty minutes after the initial observation that the patient was "cold and clammy."

The second of these deaths attributed to pulmonary embolism occurred on April 2, 1948. This patient, a twenty-three-year-old primipari, was admitted to Fairview Hospital in the care of Dr. W. D. Brown on April 1, 1948, in normal labor at term. The child was born at 10:17 p.m., and the placenta was delivered at 10:20 p.m. The patient was moved to her room at 11:05 p.m. The blood pressure was 130/72. At 12:00 midnight, she was examined by the nurse, who charted that the fundus was firm and there was moderate bleeding. At 12:10 a.m. the nurse recorded the following: "Patient screaming for water. Apparently having air-hunger, coughing frothy blood from mouth and nose. Patient extremely apprehensive. Unable to hear blood pressure. Pulse 130, weak and irregular." Cyanosis developed very quickly, and the patient expired at 12:25 a.m., fifteen minutes after the onset of the seizure.

It is impossible, since autopsy examinations were refused, to be certain of the exact cause of death in these two instances, but the probability is very great that it was amniotic fluid embolism. If this explanation is accepted, amniotic fluid embolism accounted for three of the eight maternal deaths in this hospital.

Amniotic fluid embolism was first brought to the attention of the medical profession in 1941 by Steiner and Lushbaugh,[18] who reported eight cases. In the following year they reported two more cases.[9] It was their impression that embolism by amniotic fluid, instead of being a rarity, was the most common cause of death during labor or within the first few hours thereafter.

Since Steiner and Lushbaugh's initial study, numerous other reports have been published. Hemmings[5] in 1947 presented the eleventh published case, and in conjunction with this case study he reviewed 254 maternal delivery deaths and found that the attending physicians had attributed the deaths to pulmonary embolism in thirty-seven (14.5 per cent). These clinical diagnoses were not confirmed by autopsy studies. Hemmings also called attention to a survey of delivery deaths in New York City, in which 7.4 per cent were attributed to embolism, and to another in Philadelphia, in which 11.2 per cent were thought to be due to embolism. Gross and Benz[4] in 1947 reported three cases, all occurring in their practice within one year.

In spite of such indications of fairly common incidence, cases of amniotic fluid embolism actually confirmed by autopsy studies are rare. As late as 1948 Watkins[19] found only eleven recorded cases confirmed by autopsy, and he added one more. Mallory and his group[10] in 1950 reported three cases, which were the first confirmed by autopsy in the State of Massachusetts.

Restudy of all the autopsy material from cases of maternal death at both Boston City Hospital and the Boston Lying-In Hospital failed to show any cases of amniotic fluid embolism. May and Winter[12] restudied autopsy material from eighty-one post-partum deaths and could not find a single instance of amniotic fluid embolism. Steiner and Lushbaugh[9,18] reported their ten cases in 1941 and 1942, but it was not until seven years later (1949) that they, together with Frank, reported another case.[17] Up to the present time, there appears to be about thirty-two cases recorded. Hemmings'[5] study of embolic maternal deaths reveals an amazing low percentage of autopsy examinations. This difficulty in obtaining consent for autopsies may be partially due to the confusion and grief attending the tragic and unexpected death. Actually, because of this exclusion of some of the cases of sudden unexpected death, the reported autopsy series may not be a good representation of the entire group of maternal labor deaths.

It was brought out by Gross and Benz[4] that blood should be aspirated from the right side of the heart in all cases of maternal delivery death. Such an aspiration is permissible since it can hardly be construed as a mutilation of the body. The procedure may be of great value, not only if autopsy permission is refused, but also if embalming is carried out prior to an autopsy study. By centrifuging the aspirated blood, the various elements are layered out. In case of amniotic fluid embolism, the floating elements can be recovered from the surface of the serum and the remaining amniotic debris from the top of the leukocytic "cream" immediately under the serum layer. In our case, blood from the vena cava was spread on the porcelain top of the autopsy table, and numerous flakes and strands of green mucoid material could easily be seen. Shotten and Taylor[16] reported the first case where particles of vernix could be seen grossly in the heart's blood.

Even though the total number of cases is small, the general pattern and sequence of symptoms is quite uniform. The patient most often is a multipara who is in active labor and is having hard uterine contractions. The clinical picture is that of shock and respiratory distress occurring either during labor or shortly thereafter. Symptoms develop abruptly, or at least very quickly. Often there is preliminary nausea and vomiting. The patients show an abrupt and severe drop in blood pressure. They are cold, clammy, and have a weak, fast pulse. The respirations are rapid and often gasping. There may be air hunger, cyanosis, and pulmonary edema. Uterine bleeding occasionally is present. This may be due to relaxation of the uterus secondary to the shock and the collapse. However, bleeding may occur elsewhere—for example, from the nose, from the lung, into the abdomen or mesentery. Weiner and Reid[20] noted that thirteen of twenty-two reported cases had some hemorrhagic manifestation. They believe that amniotic fluid in the circulating blood interferes with the clotting mechanism.

More than a third of the mothers died in the first hour after symptoms developed, and about three-fourths died within five hours. The remainder lived longer, and one lived eleven and one-half hours. One patient died from associated conditions on the seventh day. Steiner and Lushbaugh[9,18] believe that not all cases are fatal. In one of their cases death was due to other causes and the presence of amniotic sediment in the lungs was only a secondary finding. This observation, together with their experimental work, indicates that survival can occur.

Study of the reported cases indicates that there is no specific etiology. It is obvious that congenital disturbances in the structure or position of blood vessels cannot be a factor, because the majority of patients have had previous pregnancies without any complications. Many contributory factors have been suggested. Steiner and Lushbaugh[9,18] suggest that intact membranes or closure of the uterine outlet by the fetal head, together with hard uterine contractions, may force amniotic fluid into the placental veins. Leary and Hertig[8] demonstrated squamous cells from the amniotic fluid within the placenta and its membrane, and suggested that such extravasation is not uncommon in labor. Landing[7] found squamous cells present in the uterine vessels in from one-third to one-fourth of the uteri removed as operative or autopsy specimens in cases of placenta acreta, ruptured uterus, cesarean section, retention of placenta and premature separation of the placenta. In three of his cases, squamous cells from the amniotic fluid were found also in the lungs. These studies indicate that the entry of amniotic fluid into uterine vessels may not be uncommon and that subclinical or mild forms of amniotic fluid embolism might occur.

In about one-half of the reported cases, some tear or surgical incision into the uterus, cervix or placenta was present. Our case is unique in that a very large communication between the uterine cavity and the maternal circulation was demonstrated.

The sequence of events during amniotic fluid embolism has been postulated by Shenken, Slaughler, and DeMay[14] as follows: The outlet to the uterus is closed by the fetal head. The amniotic fluid, containing considerable debris, is trapped above it. A tear exists in the veins of the placenta or the uterus, and the uterine contractions force the trapped fluid into these open vessels. Most cases occur during labor, which indicates that active uterine contractions are a factor in the process. However, in about one-fourth of the reported cases, symptoms developed after delivery. Presumably in such cases, the open vessels exert a suction effect upon the remaining uterine contents and must actually aspirate the material from the postpartem uterine cavity.

It is believed by the various authors that death in these cases of amniotic fluid embolism is not due to purely mechanical obstruction of the pulmonary circulation. The manner of death is similar to that resulting from the intravenous injection of improper fluids or the transfusion of contaminated blood. The anaphylactoid reaction probably is associated with spasm of the pulmonary vessels. Death may be hastened by postpartem hemorrhage due to uterine atony.

The diagnosis of maternal embolism by amniotic fluid can be verified only by the demonstration of amniotic fluid sediment in the heart or lungs either by autopsy or cardiac puncture. However, there must be non-fatal cases, and these, of course, cannot be confirmed in this way. Seltzer and Shuman[15] reported a case in 1947 in which embolism apparently occurred eighteen minutes after delivery. A state of collapse lasted for thirty-six hours and was followed by recovery. Unquestionably the diagnosis of non-fatal amniotic fluid embolism is justified, but the diagnosis should not become a shelf upon which to place all cases of obscure obstetrical shock or unexplained death.

In some of the fatal cases death did not occur for several hours and in one not until after eleven and one-half hours. There is time, therefore, to carry out various therapeutic procedures. Active therapy may not be a useless gesture, since it is conceivable that if the patient could be carried over the initial period of shock, she might survive.

Active treatment consists of combating the collapse and preventing or treating pulmonary edema. On the basis of experimental studies, Steiner and Lushbaugh,[9,17,18] suggested that papaverine may be of help in abolishing the reflex vascular spasm in the pulmonary vessels, thereby helping to decrease the obstruction to the pulmonary circulation and to prevent pulmonary edema. Atropine may help to abolish the cardiac depressor reflexes from the lung. Adrenalin probably is contraindicated because of the tendency to increase the spastic obstruction to the pulmonary blood flow. An ordinary blood transfusion may increase the danger of pulmonary edema. However, an intra-arterial transfusion should be of tremendous benefit in combating peripheral vascular collapse. Oxygen should be given if pulmonary edema has already developed.

Conclusions

Embolism by amniotic fluid is a rare and unavoidable accident of labor. It can occur either during labor or immediately thereafter. Presumably, the amniotic fluid can be forced into the open veins by uterine contraction or can be aspirated by the vessels after the uterus is empty. Death is due to the toxicity of the material rather than to mechanical occlusion of the pulmonary vessels. There is some evidence that individuals may survive, and active treatment of shock may increase this survival rate.

EXSTROPHY OF THE URINARY BLADDER

Discussion of Anatomical and Surgical Principles Applicable to Its Repair, With Preliminary Report of a Case

T. H. SWEETSER, M.D., TAGUE C. CHISHOLM, M.D., and WILLIS THOMPSON, M.D.
Minneapolis, Minnesota

THOUGH sporadic attempts have been made to relieve this condition by plastic procedures, the results have not been consistently satisfactory, and the recent feeling widely expressed and recorded has been that ureterointestinal implantation and cystectomy is the only practical treatment.[6,7,8,10,12] The dangers and disadvantages of that treatment (principally pyelonephritis and hydronephrosis) have been so widely discussed as to need no further mention here.[1] The methods of turning the bladder or trigone into the rectum with preservation of the ureterovesical sphincters offer some protection to the kidneys, and the method of Boyce and Vest[1] reported to the American Urological Association in 1951 deserves commendation.

But all those methods are admittedly compromises. Review of the literature finds scattered attempts at plastic repair of the urinary tract without opening the intestinal tract. Most of these attempts have left the patient incontinent, and so have failed. An extremely few, one or two in Europe[9,11,13] and the well-known case of Hugh Young in this country,[15,16] have achieved repair with control of urine, but time has not proved that these results could be repeated by the authors or by others.

The operation reported by J. Edward Burns[2] in 1924 seemed to me to hold out the best promise, but in a later discussion elsewhere Cunningham[3] reported that Burn's patient was still incontinent, even though his bladder was closed, and that therefore the treatment had failed. Cunningham's feeling that "the overcoming of incontinence is the main object and can be accomplished only by diverting the urine to the bowel" seems to be still the prevailing opinion today.

Still we feel that Burns made a very important and unappreciated contribution in insisting that the bladder be placed in the bottom of the pelvis with obliteration of the retrovesical peritoneal pouch so that any increase in intra-abdominal pressure would push the bladder down and not forward against the anterior abdominal wall.

In the early weeks of embryonic life, the retroperitoneal pouch extends down to the apex of the prostate. The deeper part of the pouch is obliterated during fetal life, the opposing peritoneal surfaces coming together as the layers of Denonvillier's fascia.[14] The method of Burns accomplished the same result.

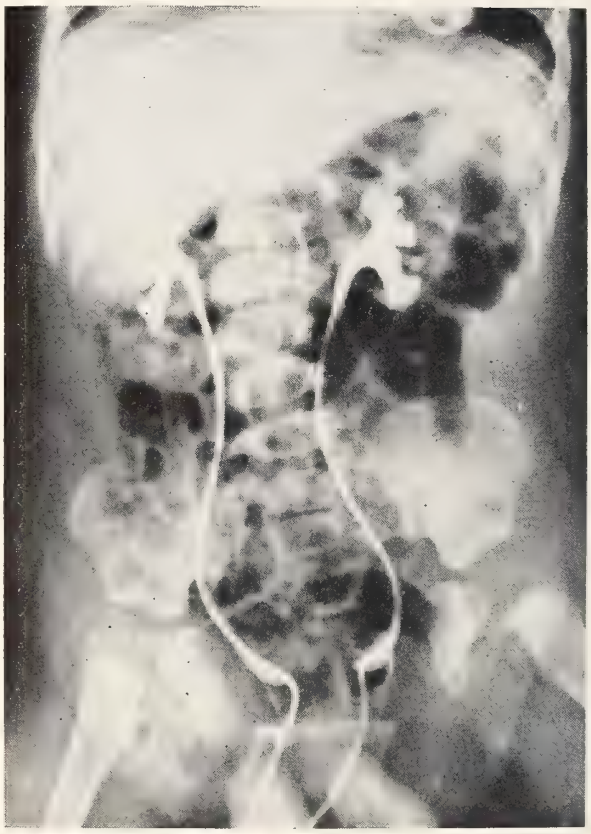

Fig. 1. Preliminary pyeloureterogram at age four months.

It seemed to us that perhaps Burns failed to eliminate incontinence because he used an open perineal operation for repositioning of the bladder and so possibly injured the nerve supply; it is recognized that operations of the prostate through the pelvic floor carry some danger of urinary incontinence. The simplified method for repositioning the bladder should avoid that danger and thus help in insuring a good functional result. With the bladder well down in the pelvis, the obtaining of urinary control should be possible in spite of

---

Read at the annual meeting of The Minnesota State Medical Association, Minneapolis, Minnesota, May 28, 1952.

the prevailing skepticism. Years after the report by Burns F. K. Garvey[5] showed a beautiful movie depicting the cure of epispadias with incontinence in the female, and in October, 1949, Dees[4] read the excellent paper on the cure of epispadias with incontinence in the male. Both authors reported good urinary control and voiding. It seems to us that placing the exstrophic bladder in its normal position in the bottom of the pelvis should reduce the problem to the same problem that Dees and Garvey had for the cure of epispadias with incontinence.

Construction of the urethra by the Dees method after repositioning of the bladder results in a normal S-curve of the urethra, as shown in the lateral urethrocystogram. Probably that also is an important factor in accomplishment of urinary control.

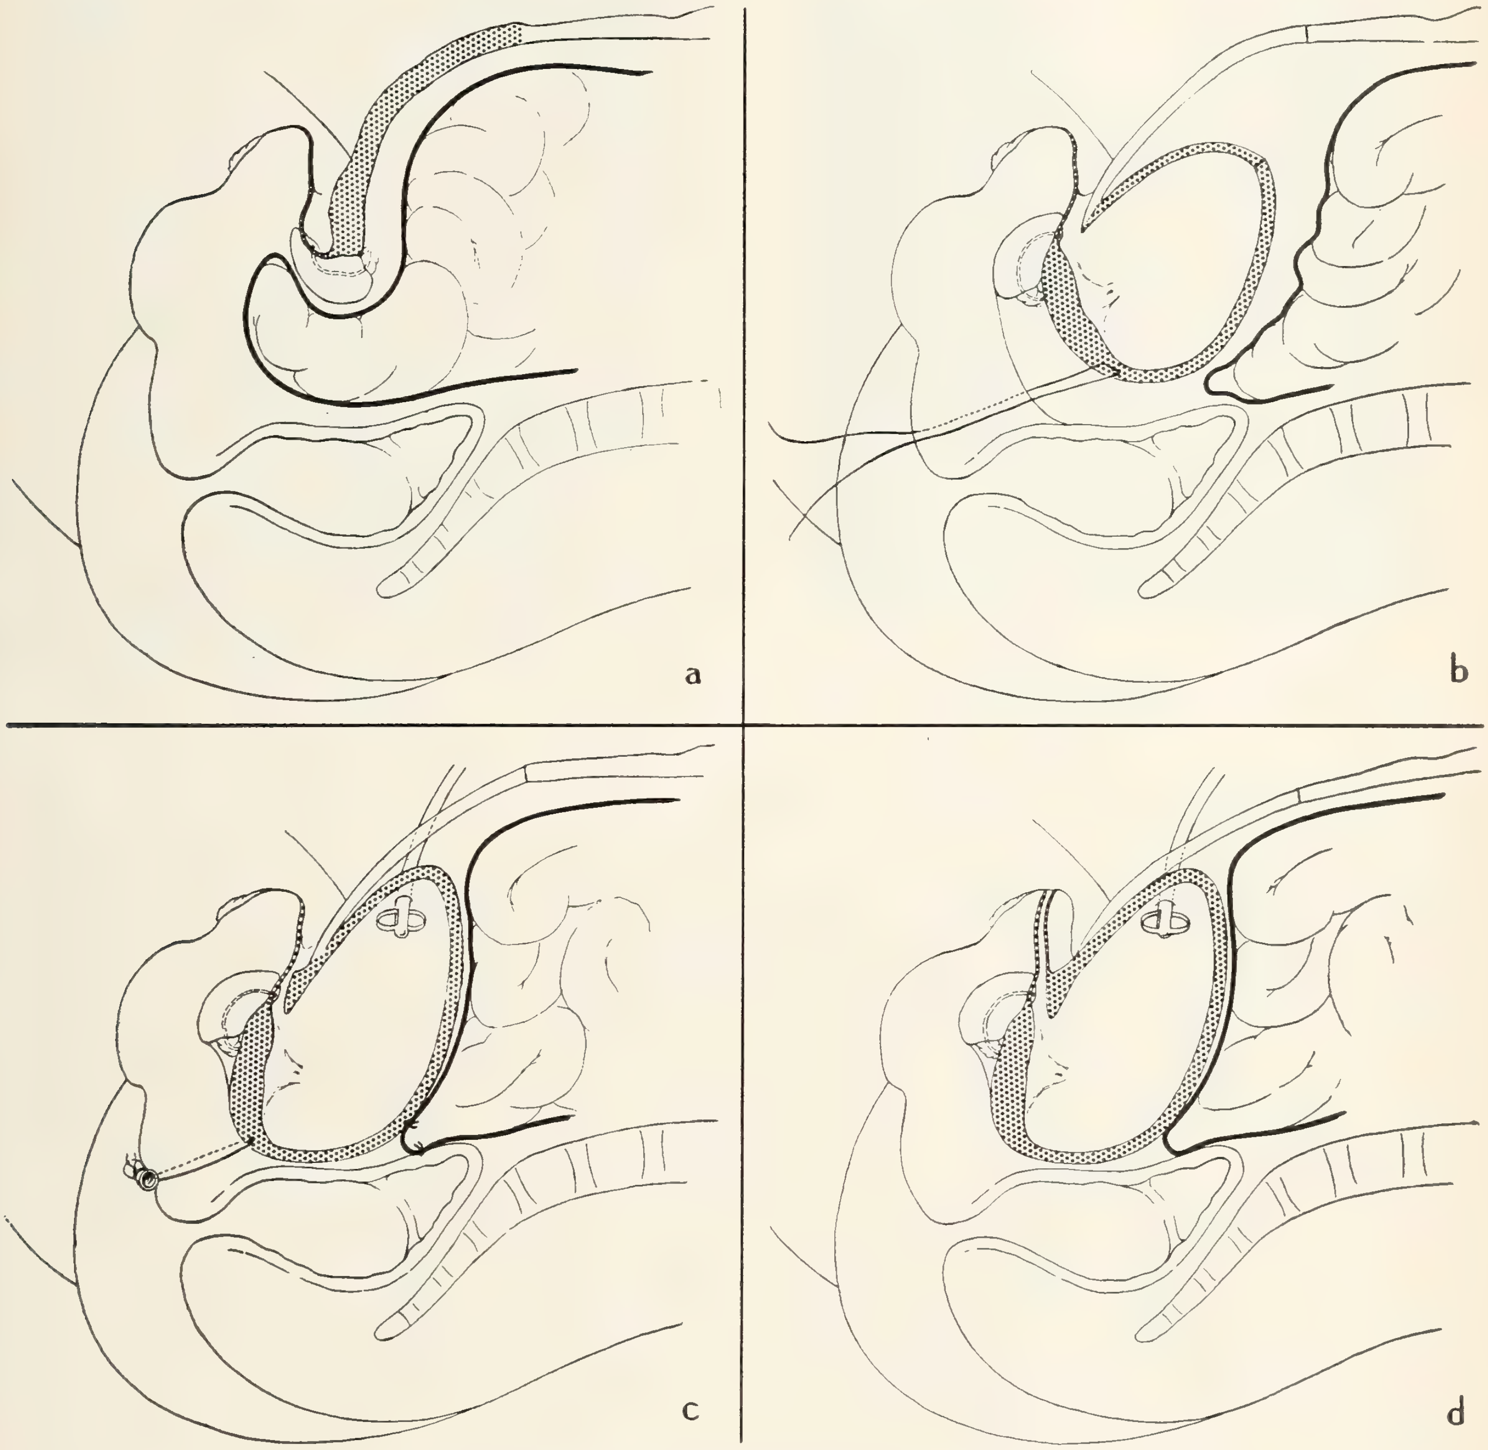

Fig. 2. Median sagittal diagrams to show stages in the operative treatment:

(a.) The condition before operation.

(b.) The bladder freed, the peritoneum freed from bladder and rectum and pushed up, and the first mattress suture passed out through perineum.

(c.) The first operation completed; the bladder fastened down in place, the peritoneum displaced upward, the bladder and posterior urethra closed.

(d.) The second operation completed; the epispadias repaired.

One other problem remains: the age at which such operations should be done. There seems to be a widespread feeling that the operation should wait until the age of four to seven years though in the last few years Higgins,[8] Meredith Campbell, and some others have recommended ureterosigmoid anastomosis before the age of one year. We feel that the first plastic operation should be done by the age of six months in order to avoid the structural changes due to mucosal exposure and infection, and the second operation may safely be done before the age of eighteen months, even though voluntary urinary control is not certain in normal children at that age.

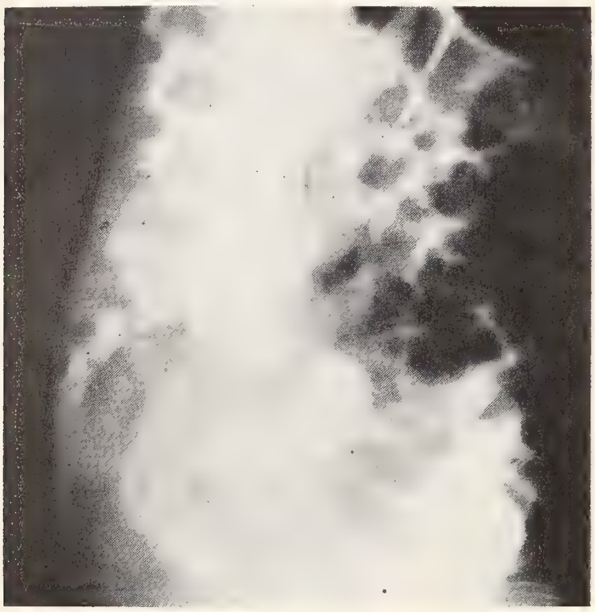

Fig. 3. Lateral cystograms showing the bladder in normal position in the bony pelvis.

Case Report

This boy was born October 15, 1950, apparently normal excepting a typical exstrophy of the bladder with wide anterior defect of the abdominal wall and bony pelvis, bilateral subluxation of the hips and bilateral inguinal hernia. It was advised that surgical treatment be postponed for five or six months to avoid the general surgical risks of the newborn.

On April 16, 1951, retrograde ureteropyelograms were made (Fig. 1) which demonstrated normal upper urinary tracts with the exception of slight dilatation of the lower parts of both ureters. The thick bladder wall lay open on the lower abdominal wall. Clear urine came forth from both ureters normally. The open bladder extended downward from the area of the umbilicus to an open depression at the site of the bladder outlet, which was continuous with the wide open urethra (Fig. 2a); the corpora cavernosa of the penis were behind the shallow groove of the open urethra which extended beyond to the end of the glans penis. Testes were in the scrotum.

On April 17, 1951, at the age of six months, the first operation was performed. An incision was made around the junction of the bladder wall with the abdominal wall. The dome of the bladder was freed from the peritoneum part way down laterally and posteriorly. The peritoneum was then opened and the pelvis explored and the hernias closed from inside. On exploration the pelvic peritoneal pouch extended clear to the pelvic floor beyond the apex of the prostate (the embryonic state); the rectum and sigmoid were normal. The peritoneum was then further freed from the bladder clear to the bottom of the pouch and then upward from the rectum. A silk suture was then placed in the bladder muscle at the midline posteriorly just above the trigone, and its long ends passed out through the perineum on needles well to each side, a finger being in the rectum to prevent damage to that organ (Fig. 2b). Another silk suture caught the posterior bladder wall to each side of the midline suture, avoiding the ureters, and its ends were similarly passed out through the perineum. The ends of those two silk sutures were later tied over short pieces of rubber tubing on the skin of the perineum. The freed peritoneum was then attached to the anterior wall of the rectum and the posterior wall of the bladder high up to obliterate the deep peritoneal pouch previously present. The thoroughly freed bladder was then closed in the midline anteriorly with drainage by wing-tipped catheter passed out through a stab wound in the right anterior bladder wall and right rectus muscle. The bladder outlet and deep urethra were narrowed by removing a triangular piece of mucosa at each side before closing over a No. 10F soft rubber catheter as described by Dees, the catheter being then removed. The anterior abdominal wall was then closed over the bladder and deep urethra by turning a triangular flap of each rectus sheath over

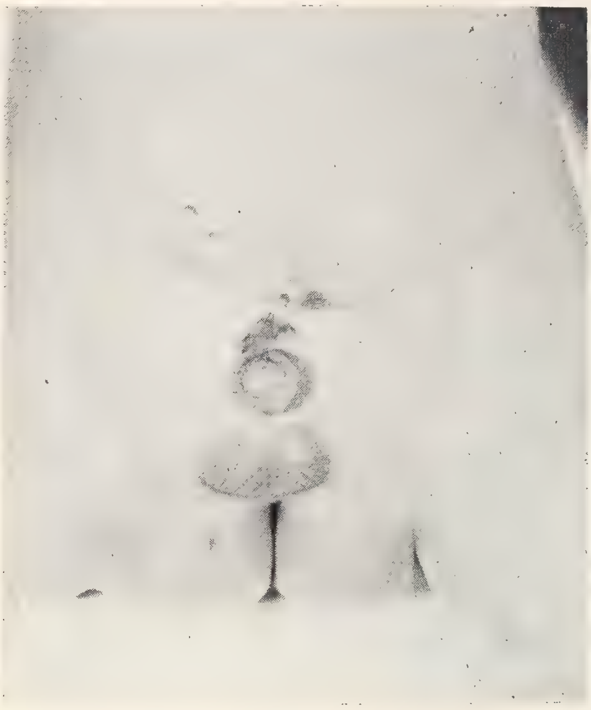

Fig. 4. Photograph of the boy at age nineteen months, three months after the second operation.

the midline and downward with considerable overlapping and without tension using silk sutures. The skin was closed over it. Convalescence was smooth and result thus far satisfactory (Fig. 2c).

On July 11, 1951, the anterior epispadias was repaired by the method of Dees over a No. 10F soft rubber catheter, but the catheter unfortunately was left in place and most of that repair broke down. On February 7, 1952, at the age of sixteen months, examination with an infant panendoscope showed a good bladder of about 50 cc. capacity with a satisfactorily closing outlet. Repair of the distal urethra was again carried out, the urethra being closed with No. 0000 chromic catgut sutures, and the overlying tissues with fine wire sutures tied over a small vitheline tube at each side. The urethral catheter was then removed, leaving only a nylon thread extending through the urethra and bladder and out alongside a newly placed suprapubic drain (Figs. 2d, and 3).

The repair of bladder and urethra have healed well excepting a pinpoint fistula at the base of the penis. Voiding is in considerable amounts from the normal urethral meatus on the glans with a good stream, though there is a little leakage under stress only from the pinpoint fistula (Fig. 4). The urine is clear. While, of course, no final statement as to urinary control can be made at this time, at present the condition seems to be what normally could be expected from a child of this age.

Conclusions

The widespread defeatist attitude regarding plastic operations for the relief of exstrophy of the urinary bladder is not justified.

The rosy picture of the life of the patient after ureterosigmoid implantation is also unjustified and it is not even certain that such a patient has a better outlook than one who has no surgical treatment at all.

We believe that the presently described two-stage operation for (1) repositioning and closure of the bladder, anterior abdominal wall, and posterior urethra, and for (2) closure of the distal urethra can be confidently expected to result in normally functioning bladder and urethra with good urinary control.

Sympathetic co-operation between the urologic and pediatric surgeons, the pediatrician, the anesthetist, and the parents is of great value in ensuring a good result by permitting operation at an early age.

Acknowledgment

The excellent work of the anesthetist, Stanley P. Wesolokski, M.D., and of the artist, Jean Hirsch Fish, is gratefully acknowledged.

BRITISH DOCTORS GET PAY HIKE

The 20,000 doctors under Britain's socialized medicine setup finally received their pay increase, which will cost taxpayers nearly $100,000,000 between now and next March. The raise, retroactive to the start of the socialized medical service in 1948, represents an average payment to each doctor of nearly $5,000.

The raise came after the doctors threatened to leave the scheme high and dry last year.

Doctors at present earn $1.70 a year for every patient on their books, and they can have 4,000 patients. The average, however, is 2,300. The increase will mean about $1,500 more yearly.—*Secretary's Letter A.M.A.*, July 14, 1952.

RECENT ADVANCES IN THE DIAGNOSIS AND TREATMENT OF CARCINOMA OF THE CERVIX

RICHARD W. TE LINDE, M.D.

Professor of Gynecology, Johns Hopkins Medical School, Baltimore, Maryland

I HAVE chosen as my subject one that offers a great challenge to us because it concerns a lethal disease and a relatively common one. Next to carcinoma of the breast, cervical cancer is the most common malignant lesion in women. Today approximately one out of four women who are treated for this disease die as a result of it. And yet, I will point out to you that there is great hope of bettering our salvage from this serious neoplasm. Fifteen years ago cervical cancer would have been about as dead a subject as one could select. The diagnosis of cervical cancer was made from a gross and usually advanced lesion; the diagnosis was confirmed by biopsy and the treatment was irradiation. Today, it is one of the most controversial subjects in gynecology. The renewed interest has been due chiefly to progress in three directions:

1. The discovery and proven practical use of cytology, as demonstrated by Papanicolaou and Trout.
2. The recognition of carcinoma *in situ* and a better understanding of its relation to invasive cervical cancer.
3. A re-valuation of the surgical technique in the treatment of cervical cancer.

Before we discuss our newer knowledge of the disease, let me emphasize a few of the things that we have known about the symptomatology and diagnosis for many years—things that are all too frequently forgotten or disregarded by many practitioners. This is regrettable because practitioners are our first line of defense against this malignancy, and failure to diagnose and treat it properly at the first opportunity often means that the only opportunity of cure has been lost.

Cervical cancer is not primarily a disease of old age. The average age is forty-eight years, but many cases occur in the thirties and some in the twenties.

Cervical cancer is not limited to parous women. About 10 per cent of our cases occur in nulliparous women, and that figure is probably pretty close to the percentage of nulliparous women in that age group.

Cervicitis probably predisposes to cervical cancer. The absolute proof of this statement is difficult, but there is strong evidence to support it. Several years ago Pemberton and Smith at the Woman's Free Hospital in Boston found an almost complete lack of cancer in a large group of women who had been properly treated for cervicitis. More recently Gagñon, who has had a wide gynecological experience among the nuns of Quebec, city and province, found an almost complete lack of cervical cancer among this group of women, in whom cervicitis occurs at a minimum. Cancer of the corpus uteri, on the other hand, was found to be as common among nuns as in the general population.

Although cervical cancer may proceed to a relatively advanced stage before giving rise to symptoms, in the majority of the cases abnormal uterine bleeding takes place when the disease is curable. If the lay public could be informed of this single fact and the practitioners could be made to carry out the necessary simple diagnostic procedures, such as the inspection and biopsying of all cervices of women with intermenstrual or postmenopausal bleeding, there would be a tremendous increase in our cure rate of this disease.

In the State of Maryland we are spending some of our cancer society money in an attempt to find out the reason for delay in diagnosis after the appearance of abnormal uterine bleeding. There has been functioning for the past six months a committee of the state medical society to determine where and why there is so frequently a delay. We have a secretary-social-worker who interviews patients with pelvic cancer at the participating hospitals in an attempt to learn from the patient the date of the appearance of the first symptom, the date of her first visit to her family physician, the type of examination done, the type of treatment instituted and the time of her reference to a qualified clinic or gynecologist. With the proper social worker this interview can be done without arousing the slightest suspicion on the part of the patient. Once a month the com-

---

Read at the annual meeting of the Minnesota State Medical Association, Minneapolis, Minnesota, May 27, 1952.

mittee selects a certain number of these cases in which there has been delay and discusses them at an open meeting to which every doctor who has had any connection with the case is invited. The cases are anonymous and the doctors concerned are anonymous to all except the chairman. In the case summaries given out to the audience the doctors are designated as Dr. A, B, C, et cetera. Discussion is free and frank. If the attending doctors wish to declare themselves, they are at liberty to do so, and not infrequently they bring in extenuating facts which may explain the delay in treatment. When a practitioner leaves the meeting he should know without any doubt that he has done wrong if he has given a woman estrogens for bleeding in the menopausal age without doing a complete pelvic examination. We consider that there has been "delay" when there has been the loss of over one month of time between the appearance of the first symptom and the institution of proper therapy. We have found patient delay about three times as frequently as physician delay, but it is most revealing to find out how often the chance of cure is missed by failure of the physician first consulted to make a proper examination. The meetings are conducted not in a critical way but with the hope of educating those members of the profession who are not as cancer-minded as they should be.

Papanicolaou smears have now been used widely enough so that the practice may be fairly evaluated. Since the establishment of cancer detection centers in Maryland we have routinely biopsied and taken smears of all women coming to the center. We are not convinced that this double procedure should be carried out routinely, but we have done it as a study to evaluate both the smear and biopsy techniques and to compare them. In a series of 2,321 cases we have found the following:

Total number of smears and biopsies	2,321	
Smear and biopsy benign	1,939	
Smear and biopsy—carcinoma	79	
False positive smears	27	1.1 %
False negative smears	17	0.73%
Doubtful smears	179	7.6 %
Unsatisfactory smears	78	3.3 %
Positive smear correct—negative biopsy incorrect	2	

An analysis of the doubtful smears follows:

Total number of doubtful smears	179	
Biopsy benign	135	74.9 %
Basal cell hyperactivity	19	10.6 %
Biopsy carcinoma	25	13.9 %

If one checks the smears of a series of proved carcinoma cases, the results are as follows:

Total number proved carcinomas	129	100 %
Biopsy positive	127	98.5 %
Smear positive	81	62.8 %
Smear doubtful	25	19.3 %
Smear negative	17	13.7 %
Smear unsatisfactory	6	4.7 %
Biopsy negative	2	1.5 %

From the above analyses we have concluded that the smear technique is of great value as a screening process of the "normal" female population. The percentage of errors will be very small, but the percentage of errors by biopsy will also be very small. We believe that the two procedures should not be considered as competitive but as complementary. If both procedures are carried out on *suspicious* cases, there will be very little chance of error. However, when dealing with advanced cervical cancer the sloughing necrotic cellular debris makes the chance of error by smear fairly high. In such cases there is little point in making a smear. The gross lesion can usually be readily seen and biopsied and an unequivocal diagnosis promptly made. Therapy should never be carried out on the report of a positive smear, unconfirmed by biopsy. When biopsy is doubtful, we have found sharp conization of the cervix with extensive microscopic study of all of the tissue to be most useful. We have not found cytology to be very helpful as a means of following response to therapy or of determining whether further therapy is indicated. There are too many abnormal cells found in smears after irradiation to make cytologic study valuable. In fact, we believe it can be very misleading. It is perhaps unnecessary to say today that cytologic diagnoses should only be made by trained cytologist. Even a well-trained pathologist may not be a competent cytologist. Finally, it should be emphasized that cytology is time-consuming and expensive. Most of the cytologic laboratories operating today are endowed and are not paying their own way.

Within the past decade the question of carcinoma *in situ* has become an important one in the minds of most gynecologists. Opinion is not crystallized on this subject among gynecologists or among general pathologists. There are three vital questions that should be answered:

1. What is carcinoma *in situ?*
2. What is its relation to invasive cervical cancer?
3. How should it be treated?

I shall attempt to answer the question—what is carcinoma *in situ?*—first. Probably the first case of carcinoma *in situ* ever to appear in the literature was described by Rubin in 1910. He did not call it by its present name but simply described and pictured two early cases of cervical cancer. Two years later Schottländer and Kermauner described the same microscopic picture in the surface epithelium around the periphery of advanced cervical cancer. It was Walter Schiller who first conceived the idea that perhaps invasive cervical cancer in its early stage existed for a prolonged time as intraepithelial, only to become invasive months or years later. By definition, then, carcinoma *in situ* is a condition of the surface cervical epithelium in which the individual cells have every characteristic of invasive cancer cells, but they remain on the surface or displace the columnar epithelium of the cervical glands. By common consent most students of the disease have agreed to include as carcinoma *in situ* the cases in which the glands have been invaded. It should be emphasized that carcinoma *in situ* is a histopathological diagnosis which applies only to the microscopic picture within the microscopic field. Actually the cervix from which that bit of tissue has been obtained may harbor carcinoma only on the surface epithelium. It may also harbor glandular "invasion" or it may harbor invasive cancer. The invasive cancer may even be extensive as it was in Schottländer and Kermauner's original cases. So let us remember that when we use the term "carcinoma *in situ,*" we are not describing the entire neoplasm.

Now let us consider the second question: the relation of carcinoma *in situ* to invasive cancer We know from Schottländer and Kermauner's description that it *may* occur on the periphery of invasive cancer, but is that only a coincidence? Does carcinoma *in situ* proceed to invasive cancer and, if so, how frequently? Is invasive cervical carcinoma invariably preceded by carcinoma *in situ.* I should like to throw some light on these questions from our own experience. Our first experiment consisted in biopsying the cervix of every patient on the ward service on whom we planned to perform a hysterectomy for myomata, recurrent functional bleeding, et cetera. In those cases in which carcinoma *in situ* was found on biopsy the cervix which was removed by total hysterectomy was cut into several blocks and semi-serial sectioning was done of each block. A careful study was made of each section. In approximately three-fourths of the cases we found either gland "invasion" or true invasion. The actual percentage of true invasion is difficult to ascertain because there are too many cases in which the differentiation between glandular invasion and true invasion is equivocal. That is about all the evidence that we are able to produce by purely histologic study.

There is something to be learned by following these cases clinically. We had seen a few cases in which clinical invasive carcinoma had developed where a previous biopsy showed intra-epithelial carcinoma. Other similar cases began to appear in the literature, and this was *suggestive* that in at least some instances pre-invasive cancer precedes the invasive growth. This could be a coincidence if it occurs only occasionally, so it is highly important to know how frequently invasive cancer is preceded by the pre-invasive type. From 1941 to 1951, inclusive, we treated 723 cases of cervical cancer. We found on going through the histories of these women that thirteen of them had had their cervices biopsied in our clinic from one to seventeen years before. We still had the slides and blocks of tissue available for study. Upon making a study of the early slides or of slides obtained by cutting more sections of the blocks we found carcinoma *in situ* to be present in eleven of the thirteen cases. In one case there was no epithelium present in the block so it must be excluded. That reduced the cases for complete study to twelve. In the twelfth case a diagnosis of intra-epithelial carcinoma could not be made, but there was much evidence of hyperactivity of the basal epithelium. It appears to us that the pre-existing presence of carcinoma *in situ* in eleven out of twelve cases available for study is very significant. The shortest time interval between the initial biopsy and the discovery of the clinical cancer was one year and longest time seventeen years. It appears, then, that in the vast majority of cases in which study was possible pre-invasive cancer existed before the development of clinical invasive cancer. But that is not to say that this invariably is the case—nor can it be said that intra-epithelial carcinoma invariably becomes invasive cancer. I think in our present state of knowledge we would have to say that the latter is not true. Knowing, as we do, that carcinoma *in situ* may remain non-invasive for many years, it is quite certain that many women die of other diseases before the carcinoma becomes invasive. In our present state of knowledge it would appear that clinical cervical cancer, as we have been accustomed to think of it, is only a short span of the complete life of the carcinoma. This is borne out by the fact that the average age of the women in our series with cervical cancer is thirty-six years and the average age of clinically invasive cervical cancer is forty-eight years.

Our treatment of carcinoma *in situ* has been removal of the entire uterus with a moderate amount of parametrial tissue and a reasonable vaginal cuff. We believe that he vaginal cuff is the most important deviation from the ordinary total hysterectomy technique because often the cervical lesion extends to the very edge of the cervix and in a few instances to the vaginal cuff. In young women we have on several occasions saved one or both ovaries. We have now operated on over 150 such cases, and all of the women are well. Slightly over fifty of them have been well for more than five years after their operation. During this time we have treated eight cases of intra-epithelial carcinoma with irradiation. Among them there was one death, and, strangely enough, it occurred within six months after treatment. Autopsy showed metastatic cancer. Since our original study required a histological examination of the removed cervix, our original treatment was by surgery. The results have been so good that we have hesitated to change to irradiation although there is little doubt that a high percentage would be salvaged by irradiation. Another advantage offered by surgery is the preservation of ovarian tissue in the younger patients. Since many of the patients are in the third decade, the desirability of saving ovarian function is obvious.

There is no doubt from our results that we are treating these patients adequately. The question may justly arise as to whether we are overtreating them. Fortunately, all of the students of this disease have not approached the problem the same way. Paul Young, for example, has tried to evaluate his cases before treatment to a fine degree as to glandular and true invasion by extensive biopsying. Those in which the disease is strictly limited to the surface epithelium he has treated by catuerization, conization or amputation. Of forty-one cases treated thus conservatively, fourteen subsequently required further treatment for cervical cancer. Young has done an important experiment. How shall we interpret the result? Personally, I believe that such treatment is not justifiable when fourteen of the patients require further treatment for a lethal disease. It is true that some children have been born to women in Young's series after the diagnosis of carcinoma *in situ* was made, but one cannot help but wonder whether this calculated risk is justifiable. In my opinion it would be justified only under most unusual circumstances and when the patient is under very close observation by an expert. The weak point in attempting to evaluate accurately the extent of the disease preoperatively lies in the fact that one never knows the extent of the disease until the entire uterus has been removed and carefully studied microscopically. Our pathological material has shown this repeatedly.

I hope that what I have said about the surgical treatment of carcinoma of the cervix *in situ* will not be construed as applicable to invasive cervical cancer. I firmly believe that the treatment of invasive cervical cancer is irradiation. There are a few exceptions to this general rule, of which I will speak later. In order to form an opinion regarding therapy for this disease, one should look at the question historically. At about the turn of the century Cullen reported in his classical volume on *Cancer of the Uterus* that 26 per cent of the cervical cancers that had been operated upon by radical hysterectomy and pelvic lymph node dissection were well five years later. Some years later radium became available, and some of the more advanced cervical cancers were treated with it. In many instances there was surprising improvement and in some instances cure. Then some of the less-advanced cases were treated with irradiation, and the results steadily improved, until in recent years the over-all five-year cure rate with irradiation reached 25 to 30 per cent. Some series have shown better than a 30 per cent five-year cure. These irradiation results are much better than Cullen's operative results because his 26 per cent cure rate was based on only the cases operated upon, whereas the irradiation results were based on all cases seen. For comparison of these irradiation results, let us look at some later operative results. Sir Victor Bonney of London spent his entire active surgical career performing the radical Wertheim type of hysterectomy for cervical cancer. His last report was on the results of 600 operations performed by him. He operated upon 63 per cent of the cervical cancers that he saw and had a five-year cure rate of 41 per cent. If one multiplies 63 by .41, the answer is 25.8, practically the same percentage of cure attained by irradiation in most clinics. His operative mortality was 14 per cent. In 1950, Charles Read, Bonney's successor, came to this country and spoke on his results with the Wertheim type of radical hysterectomy with lymph gland dissection. He had modified his views considerably from those of his former teacher, Bonney. Operability had been reduced from 63 to 14 per cent, and his five-year cure for Stage I and II combined was 44 per cent. Operative mortality had been reduced to 5.5 per cent, as might be expected with greater selectivity of the cases. The percentage of five-year salvage of Stage I and II from most irradiation clinics exceeds the figure reported by him. For example, Read reports an 80 per cent five-year salvage of Stage I and 61 per cent salvage of Stage II in the Madame Curie Hospital.

The percentage of urinary fistulas resulting from irradiation and surgery is approximately the same, in the neighborhood of 10 per cent. However, these figures are not really comparable. The fistulas resulting from irradiation occur most often in the advanced cases where life expectancy is usually short, whereas the fistulas resulting from surgery occur in the individuals having "operable" lesions. These are the earlier cases which have a good chance of permanent cure. It is one thing to be responsible for a urinary fistula in a woman whose life expectancy is only a year or two and quite another thing to create one in a woman who has a long life expectancy.

Finally, Meigs has carried on a surgical experiment on early cases which were carefully selected as being good operative risks. He has performed over 150 operations, more radical than Wertheim's, without a single death. He has recently reported on eighty-five cases which were operated upon five or more years before. Of his Stage I cases he has a five-year salvage of 80 per cent. This percentage of cures is somewhat better than the usual 70 per cent reported from the better irradiation centers, but the figures are not quite comparable. Meigs' cases were a selected group, and it must be remembered that the patients who are better operative risks also respond better to irradiation. Meigs, then, has shown that in the hands of an expert the results with surgery in Stage I cervical cancer are slightly better than with irradiation. However, these results do not give *carte blanche* to every gynecologist or surgeon to attempt radical pelvic surgery which requires special training and ability. Perhaps one of the greatest sins today in surgery is the attempting on the part of the average pelvic surgeons to do the radical hysterectomy with pelvic lymph gland dissections, only to end up with an incomplete operation. The woman with Stage I cervical cancer has a much better chance of survival when irradiated than when operated upon by the average pelvic surgeon. The more advanced the lesion is, the greater becomes the advantages of irradiation therapy over surgery. In our clinic we perform radical hysterectomy and pelvic lymph node dissection only upon irradiation resistant cases of Stage I and rarely Stage II. The resistance to irradiation therapy can usaully be detected within five or six weeks after irradiation is instituted.

GRAY LISTS $137 MILLION SAVINGS, $40 MILLION IN MEDICAL FIELDS

Veterans Administrator Carl R. Gray, Jr., reporting on his four years as head of the organization, lists economies of $137 millions, with approximately $40 millions saved in medical fields. His summary was presented to the House Veterans Affairs Committee. Savings in the medical department (other than in construction and administration) were said to include:

1. Reduction and control of number of physical reexaminations for adjudicatory action—$25,250,000 saved.
2. Standardization of procedure for collection of fees from insurance companies for hospitalization of veterans with non-service connected conditions—$7,200,000, "which would not otherwise have been paid the government by the insurance companies."
3. Inventory and personnel economies in pharmaceuticals—at least $2 million.
4. VA's operation of its own blood bank program—$3 million saved.
5. VA's operation of its own dental laboratories—$2.3 million saved.

The above economies do not represent reductions in overall spending. VA's total budget for fiscal 1948 was $6,922,457,320, with the medical department getting $588,561,819. For fiscal 1952 the total estimated budget was $4,409,265,220, with $703,190,160 for medical activities.—*Capitol Clinic,* July 8, 1952.

SURGICAL LESIONS OF THE BREAST

R. F. HEDIN, M.D.

Red Wing, Minnesota

WHEN a physician is confronted with a patient, who recently has discovered a lesion in the breast, his responsibility for an early, correct diagnosis and adequate therapy is tremendous. The end result will be directly related to his knowledge of the underlying pathological process and to his ability to establish a correct diagnosis and institute early adequate therapy. Fortunately, because of an increased awareness on the part of the public, due to widespread education regarding lesions of the breast, patients are presenting themselves at an earlier stage in their disease than they have done in the past. The medical profession has long advocated the need for patients to present themselves early, but only recently have patients been instructed in a systematic thorough method of self-examination of their breasts so that very early lesions might be detected before the pathological process becomes widespread. Much credit is due to the American Cancer Society[17] and others[15] in disseminating to the public this type of valuable information. Better results in the future will be forthcoming.

In the vast majority of cases, lesions of the breasts are accidentally discovered by the patients themselves. Too often when they have been casually discovered they have already assumed rather sizeable proportions and have spread far beyond the confines of the breast. Only occasionally is an unknown lesion of the breast found on routine physical examination. Economically, it is not feasible for a patient to have professional examinations of her breasts often enough for early lesions to be detected. For this reason, periodic self-examinations of the breast as advocated by Haagensen, would seem to offer the best means at our disposal, at this time, in bringing early lesions to our attention. Patients should be taught systematically to palpate their breasts while in the supine position, to note any change in symmetry, any change in the contour of the skin or nipple and to observe if any discharge can be expressed from the nipple. They should be taught that whenever anything that seems to them at all unusual is found, they should present themselves immediately for professional evaluation of their findings.

Physicians should likewise familiarize themselves with a thorough method of examining the breasts of the patient in both the sitting and supine position. Inspection as to changes in the contour of the breast showing the retraction phenomenon of the skin overlying the pathological process is certainly one of the most valuable methods of examination. Indeed, it often gives the clue to tumor before palpation of the tumor can be certain. An attempt to express discharge from the nipple often will give valuable information as to an early lesion of the breast. The need for uniform thorough examinations of the breasts by a physician and correct evaluation of lesions is of extreme importance. In a recent study of a series of breast tumors,[17] it was found that in 27 per cent the patients had been given wrong advice by the first physician whom they consulted.

The breasts are derived from the sweat glands and are composed of fifteen to twenty-five lobes which radiate from the nipples.[8] The lobes are composed of lobules which in turn are made up of acini. The acini are lined by two layers of cells, an inner layer of columnar cells which are secretory in function and an outer layer of flat ovoid cells which are regenerative in function. Separating the acini and lobules are strands of connective tissue which attaches to the skin—the so-called suspensory ligaments of Cooper. These connective tissue septa in disease become fibrosed and contract causing the retraction phenomenon, or dimpling of the skin, which is so often the tell-tale evidence of underlying pathology. Traversing throughout the breast is a network of lymphatics which, according to Adair,[3] drain into nodes in the base of the axilla, then extend into nodes along the subclavian vein to the group lying behind the pectoralis minor muscle. Drainage likewise extends to the nodes in the falciform ligament or extend upwards into the base of the neck or into the mediastium. Knowledge of these pathways is essential in ascertaining the extent of involvement when neoplastic disease is encountered, as well as to what constitutes a radical mastectomy when neoplastic disease is to be erradicated.

Hormones have a profound influence on the

    2. Adenosis
    3. Cystic Disease
B. *Benign Neoplasia*
  True, benign tumor formation
    1. Benign Fibroadenoma
    2. Benign Intracystic Papilloma
      a. Papillary invagination of large ducts
      b. Intracystic papillomas
      c. Papillary hyperplasia
C. *Benign Nonindigenous Tumors*
  Lipomas, Angiomas, Leiomyomas,
  Dermoids, Sweat Gland Tumors

breasts. Estrogen causes the rapid growth and changes in the breast at puberty. There are continuous changes in the breast during the menstrual cycle. During the first half of the cycle, estrogen produces a gradual growth of glands. Progestin produces further change in the latter half of the cycle. Once pregnancy is established, progestin causes an increase in the growth of the glands with proliferation of lobule arrangement. Prolactin, a hormone of the anterior pituitary, reacts to produce actual secretion of milk. An understanding of the effect of these hormones will give an insight into the cause of many of the complaints referrable to the breast. Indeed, it is thought that many of the lesions of the breast are expressions of ovarian function.

Unanimity regarding the classifications of benign breast tumors is lacking. Clinicians and pathologists often use different classifications. Geschickter,[10] Copeland,[9] Bloodgood,[6] Cole[8] and others[4] have classified breast tumors. Copeland's classification, based on the work of Geschickter, seems to be a practical one (Table I).

Mammary Dysplasia

Mastodynia, or painful breast, is found most often in women between the ages of twenty and forty years. Married women suffer from this condition three times as frequently as unmarried women. The pain is usually gradual in onset over a period of months and becomes worse just before or during the menstrual period. It often occurs in women with small breasts and it may be present in one or both breasts. The breast tissue in the painful area becomes thicker and more granular than the surrounding breast tissue. At times the disease appears to be a precursor to cystic disease. If biopsied, this nonencapsulated, dense and fibrous tissue may contain small cysts. The normal lobule formation in the breast is dependent on the proper ratio of estrogen and luteal hormones. In mastodynia, it is thought that there is a relative lowering of the function of the corpus luteum or an excessive stimulation by the estrogenic hormones. Progesterone given twice a week for the last two weeks of two consecutive cycles seems to give the most relief to these patients who so often believe their painful breasts are due to more serious lesions.

Adenosis (Schimmelbusch's disease) of the breast is characterized by an increase in the fibrous tissue in the parenchyma which is riddled with minute adenomas, papillomas and dilated ducts. These lesions may be found in one or both breasts. The diseased areas are usually thickened and painful, and an edge can be palpated at the periphery of the diseased portion. The age group most commonly affected is from adolescence to forty-five years. Those who develop sexual maturity early with small breasts due to stunting from high estrogenic stimulation often suffer from adenosis of the breast. Also many women over thirty years of age with menstrual complaints often present themselves with symptoms suffered for a year or more. The multiple nodules, which are so often found, are thought to be due to hyperestrinism brought about by a low function of the corpus luteum. If these lesions are observed over a period of years about 2 per cent will become malignant. Estrogenic therapy has proved to be of no value and often makes the condition worse. Progesterone given between two or three menstrual periods has proven to give the most benefit in adenosis of the breast.

Cystic disease of the breast is a condition about which much controversy centers. The findings of extensive histological and clinical research by Warren,[30] Campbell,[7] Adair, Bloodgood[6] and others,[1,20] have differed as to whether these lesions should be considered as precancerous lesions. At the present time, it would appear that certain types of cystic disease are more prone to eventuate into neoplastic growths and it may be said that a patient with cystic disease of the breast will develop malignancy more often than the patient with normal breasts. Cystic disease occurs most often near the menopause. Symptoms often come on quickly over a period of a few days to a few weeks. It is frequently seen in childless women in their early forties, first having symptoms of a burning or sticking in their breasts even before a definite lump can be palpated. Multiple cysts are found in one or both breasts in about 25% of the cases. It is thought estrogenic stimulation results in the formation of the cysts. When these lesions are biopsied, often one or more cysts will be seen or a large single cyst which Bloodgood has described as "blue-domed cysts." Excision will cure the vast majority of these lesions, but a periodic vigilant follow-up should be carried out on all patients with cystic disease of the breast.

Fibro-adenoma are composed of fibrous and glandular tissue, their firmness depending on the predominence of either cellular element. They are found most frequently in young women who usually give a history of a painless mass that has been getting gradually larger over a period of a few months. Because of the difficulty in differentiating these benign lesions from early malignancy, excision should be caried out promptly. They are encapsulated and only in a small percentage of cases do they reappear. If they appear at the time of the menopause and go untreated, they often develop into large fibromyxomas or fibrosarcomas.

Benign intracystic papilloma occur most frequently in women near or beyond the menopause. They are found as often in nulliparous as in parous women and are due to a papillary invagination of the large ducts. At times the papillary growth may completely fill a cyst cavity. These lesions are usually slow growing and present themselves as a soft mass which is freely moveable and often encapsulated. They are most frequently found in the central zone of the breast and when compressed will present the significant symptom of bleeding from the nipple. Repeated attempts to locate the source of the bleeding is necessary, and when found excision is promptly carried out. Because of the bleeding, they usually command the attention of the physician to ascertain whether or not the bleeding might not be caused by Paget's Disease or other types of malignancy of the breast.[16] Campbell, Geschickter, Adair and others[11,16] found bleeding to occur about as often in malignancy as in benign lesions. If there are multiple sources of bleeding or when limited excision does not remove the entire bleeding process, simple mastectomy is indicated.

Benign nonindigenous tumors, such as lipoma, angiomas, leiomyoma, dermoids, should be removed as their presence invariably causes the patient to fear impending malignancy.

Malignant tumors of the breast.—Carcinoma comprises the overwhelming majority of neoplasms of the breast. Sarcoma and malignant myxomas are rare. In 6,558 patients with malignancy of the breast seen at the Mayo Clinic between 1910-1940, Harrington[17] found 99.4% to be carcinoma. Carcinoma of the breast is by far the most common malignant lesion in the female (Fig. 1). It is ten times more common in the female than in the male. Carcinoma is found simultaneously in both breasts in about 1% of the cases. About 5% of patients treated for carcinoma of the breast will later develop carcinoma in the remaining breast.

Little is known regarding the etiology of human breast carcinoma. Endocrines, heredity and previously existing cystic disease and benign tumors are known factors in the development of these neoplasms. Bittner's excellent work on the milk factors in mice has not been proven in the humans as yet, because the time factor involved in studying generations of human beings. Trauma to the breast often results in fat necrosis which clinically simulates carcinoma, but trauma, per se, has never been considered a great etiological factor.

Although many classifications of mammary carcinoma have been put forward, none are acceptable to clinicians and pathologists alike. Attempts at grading these tumors have met with acceptance in most quarters.[12,26,27] The type of cellular structures composing the tumor and the behavior of the tumor as regards metastasizing will give a rather accurate prognosis. For this reason, immediate biopsy of any suspicious lesion of the breast and a meticulous search for regional and distant metastasis should be undertaken. Various methods of biopsing lesions of the breast have proven to be accurate. The employment of aspiration biopsy by the Memorial Hospital group in New York[2] has given satisfactory results in their hands. By this method the type of cells present are determined, but it is impossible to obtain information regarding the relationship of various structural components in this procedure. Many men deprecate incising a wedge-shaped portion of the tumor for microscopic study because of the fear of spreading cancer cells into channels where they might rapidly disseminate. However, Haagensen believes no harm results if incision into the tumor is carefully done. Complete excision of the tumor, with a portion of surrounding normal breast tissue, has been a certain, accurate method that has given the surgeon ample opportunity to study the tumor grossly at the operating table. The correlation of the gross ap-

pearance of the tumor, with the reported microscopic findings, will give the greatest information about the type of lesion present. Indeed, many men believe the gross appearance of the tumor will give more information than frozen microscopic sections of the tumor.[8] If there is doubt as to the type of pathology present, many sections should be studied from paraffin sections to arrive at a correct diagnosis. There is not much evidence that removal of a malignant tumor, with a wide margin of tissue, several days before radical operation exerts any deleterious effects.

Once a correct pathological diagnosis has been made and the extent of metastasis determined an attempt should be made to erradicate the cancer, if possible. If the disease process has spread to the skeleton, lungs or other distant points; if the skin over the breast is extensively involved; if there is edema of the arm, palliative treatment is recommended. If the cancer is confined to the breast and the adjacent axillary nodes an attempt should be made to remove completely the cancer by radical surgery. One should keep in mind, that as of today, radiation[5] and surgery[21,24] are the only proven methods of dealing with breast cancer. The literature[14,15,17,26] abounds with statistics regarding five-year survival rates for each method and for a combination of both. Most claims for each of the methods will be decided in the future.

Radiation, by means of radium needles, has been reported by Keynes[19] as being successfully used in treating cancer of the breast with axillary metastasis. McKittrick[22] in this country attempted to repeat Keyne's results, but has now abandoned this treatment in favor of radical surgery.

McWhirter of Edinburgh[23] has recently published some rather astonishing five-year survival rates, in which simple mastectomy was carried out for carcinoma of the breast with axillary metastasis, leaving the axillary nodes to be treated postoperatively with heavy doses of radiotherapy. He bases the rationale of this treatment on his belief that the axilla cannot be freed of all cancer with surgery. It is a well-known fact that radiotherapy can cause extensive fibrosis in which cancer cells are "locked up" for many years, but never thorougly destroyed. Time will disclose whether or not there is a place for this type of combination therapy in the treatment of cancer of the breast.

Simple mastectomy alone, unfortunately, is still done by some surgeons who have a defeatist attitude regarding this disease. By doing this limited surgical procedure the surgeon foregoes the opportunity for his patient to participate in the excellent five-year survival rate statistics that have come forth following radical mastectomy. About 60% of patients with cancer of the breast have axillary metastasis when first seen. These patients in which the disease is limited to the axilla should have a classical radical mastectomy in which sufficient time is taken to dissect out meticulously all nodes high in the axilla, supraclavicular space and other lymphatic pathways. The work of Halsted, Willy Meyer, Greenough,[28] Rodman and others layed the foundation as to what constitutes a radical mastectomy. By utilizing many of the facilities available today such as anesthesia, blood transfusions, antibiotics and others, the operability rate has been extended. Today, radical mastectomy, as advocated by Adair, Pack,[25] Haagensen, Cole and others, offers the patient with cancer of the breast a better chance for cure than ever before. More patients are given this chance as the operability rate now approaches 75%. A few surgeons have attempted more adventuresome surgery in which they have attempted to remove the nodes within the thorax, elevate the clavicle, and routinely do an extensive neck dissection. Their experience has been limited to very few cases and the benefits derived from these extensive procedures is still doubtful.

The value of preoperative and postoperative radiation[21] has been a debateable subject for years. At the present time, preoperative radiation has been dispensed with by most men, but postoperative radiation is still being used in an attempt to "lock up" in dense fibrous tissue any remaining cancer cells, and to prevent local recurrences over the operative site and axilla.

Radiation has a definite place in the treatment of metastasis. Its role here has definite value and should be started when the patient complains of pain which so often is the first symptom of bony metastasis. Radiation should be started even before the metastatic lesions are demonstrated by x-ray. Relief is often spectacular and often gives the patient months and sometimes years of comfort.

Attempts to influence the course of breast carcinoma by changing the hormone balance in the patient has been accomplished by doing routine castrations,[18,29] either by surgery or radiation, on all patients with breast carcinoma. This was first done because of the known rapid growth of carcinoma of the breast during pregnancy. It is the routine procedure in most clinics to give irradiation to the ovaries.

Hormonal therapy in the form of androgen and estrogen has been given a thorough trial in many clinics[13] during recent years. At the present time, it would seem to be a valuable supplemental type of treatment in treating metastasis. It often gives the patient a feeling of well being which at times extends over a period of months.[2] Androgen seems to be of greatest benefit to women under sixty years of age in which irradiation to painful bony metastasis no longer gives relief. Some rather startling results have been recorded when used in this manner. Estrogen gives most benefit to women over sixty years of age when the metastasis in soft tissue no longer can be controlled by radiation.

In conclusion, it should be stated that if women can be educated in self-examination of their breasts and present themselves early to their physician and receive adequate radical surgery, even better results will come forth in the future.

THE USE OF METHANTHELINE BROMIDE (BANTHINE) IN PEPTIC ULCER AND OTHER GASTROINTESTINAL DISORDERS

(Continued from Page 640)

The maintenance dose must be adjusted to each individual case, remembering that night control is still of fundamental importance.

3. *The unnecessary use of Banthine.* In self-limited conditions such as the acute diarrheas and in irritable bowel cases in which the regulation of the patient's life and habits, his general hygiene and his diet is of more fundamental importance, Banthine is not needed.

4. *The use of Banthine in the face of obvious contraindications* such as those previously mentioned. Irreparable damage can at times be done in this way and it behooves us to survey each patient carefully for abnormalities which contraindicate its use.

Finally, it is only by the judicious use of Banthine that its value to our patients can be enhanced. This drug is still in its infancy. It is only by carefully evaluating its effect in each individual case that its ultimate place in therapeutics can be established.

INTERRELATIONSHIPS BETWEEN CARDIAC AND PULMONARY DISEASES

RICHARD V. EBERT, M.D.
Minneapolis, Minnesota

BECAUSE of the close anatomic and physiologic relationship between the heart and the lungs, it is to be expected that disease of one organ will produce an effect upon the other, and that this may often lead to difficulties in diagnosis. Dyspnea is the commonest symptom in diseases of the heart and yet this symptom is pulmonary in origin. Diseases of the lungs may lead to right heart enlargement and failure and be confused with primary disease of the heart. If pitfalls in diagnosis are to be avoided, it is important to understand the changes in the lungs produced by heart disease, and, conversely, the effect of pulmonary disease upon the heart.

Heart disease produces changes in the lungs by alterations in the pulmonary vascular pressure. Under normal circumstances the pressure in the vessels of the lungs is low. The mean pressure in the pulmonary artery of a normal man is 15 mm. Hg and the capillary pressure 9 mm. Hg. Failure of the left ventricle associated with systemic arterial hypertension or aortic valve disease leads to a sudden rise in pulmonary vascular pressures. If the pulmonary capillary pressure exceeds the colloid osmotic pressure of the blood, pulmonary edema ensues. These changes in the lungs are responsible for the familiar symptom of dyspnea. The combination of dyspnea, cardiac enlargement together with the typical findings of pulmonary edema, usually makes the diagnosis simple. Occasionally the atypical nature of the pulmonary edema in the roentgenogram of the chest may lead to confusion in diagnosis. The edema may be confined to one area of the lung simulating pneumonia. This may be particularly confusing if cardiac enlargement is absent as may be true in myocardial infarction with associated left ventricular failure.

Mitral stenosis produces chronic pulmonary hypertension. This is to be expected as the interference with the flow of blood from the lungs into the heart is caused by a mechanical obstruction rather than to changes in the efficiency of the cardiac musculature. Acute attacks of pulmonary edema may occur as in left ventricular failure but more commonly a different clinical picture is seen. The patient will complain of chronic exertional dyspnea which is oftentimes associated with cough and hemoptysis. These patients will have marked elevation of the pressure in the pulmonary arteries. Microscopic sections of the lungs will show thickening of the alveolar septa and hemosiderin-filled macrophages in the alveoli. Because the murmur of mitral stenosis is readily overlooked, the symptoms are often wrongly attributed to bronchitis or bronchiectasis. The appearance of the roentgenogram of the chest may lead to confusion. There may be a reticular appearance to the lung simulating a fine pulmonary fibrosis or an appearance resembling miliary tuberculosis. This roentgenographic picture has been called hemosiderosis of the lungs.

An accumulation of fluid in the pleural cavities is a common accompaniment of congestive heart failure. The fluid is usually bilateral, although it may be more marked on the right. Occasionally marked unilateral hydrothorax occurs as a complication of heart failure. This may not be accompanied by peripheral edema. Under these circumstances, the pleural fluid may be falsely attributed to tuberculosis or bronchogenic carcinoma.

Dilatation of the pulmonary arteries is commonly seen with pulmonary hypertension complicating heart disease but is usually moderate in degree. With certain types of congenital heart disease the dilatation may be enormous. This is particularly true in auricular septal defect which is associated with a marked increase in pulmonary blood flow. Dilatation of the major trunks of the pulmonary artery may complicate pulmonic stenosis or may occasionally occur as an isolated anomaly.

Pulmonary infarction is a common complica-

Sponsored by the Veterans Administration and published with the approval of the Chief Medical Director. The statements and conclusions published by the author are the result of his own study and do not necessarily reflect the opinion or policy of the Veterans Administration.

Read before the annual meeting of the Minnesota State Medical Association, Minneapolis, Minnesota, May 26, 1952.

tion of congestive heart failure. It should be suspected whenever a patient with cardiac disease complains of chest pain or hemoptysis. At times the only clinical manifestation may be a worsening of the symptoms of heart failure. The roentgenographic picture of pulmonary infarction is often confused with or obscured by pulmonary edema and hydrothorax.

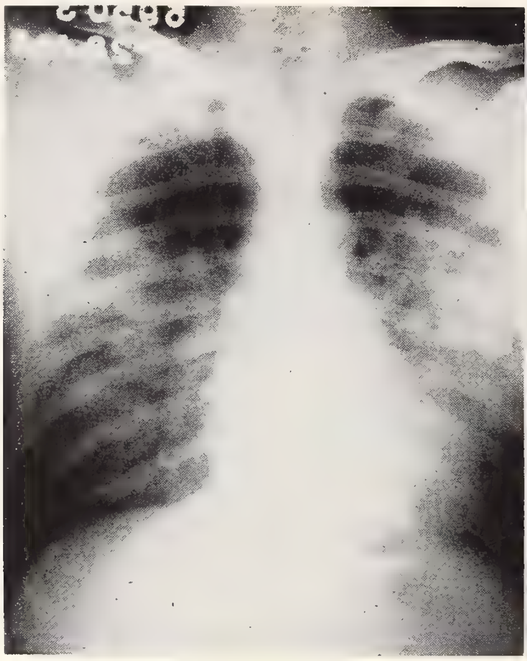

Fig. 1. Hypertensive heart disease with pulmonary edema.

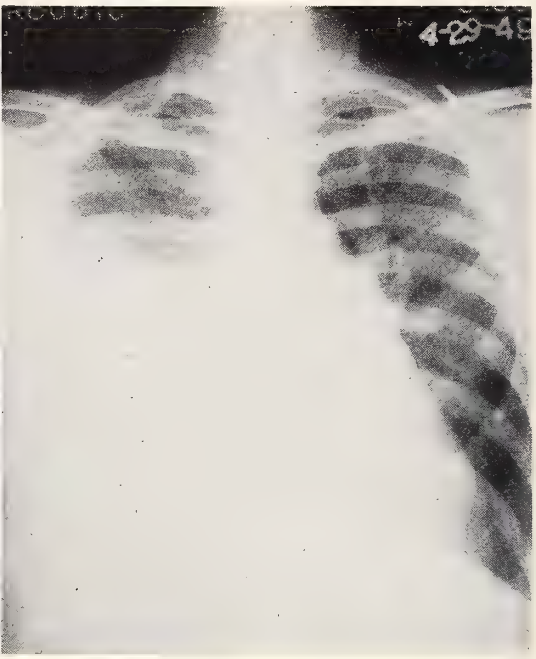

Fig. 2. Mitral stenosis with unilateral hydrothorax.

Localized diseases of the lung such as pulmonary tuberculosis, lung abscess, bronchogenic carcinoma or bronchiectasis produce little effect on the heart. This is because these diseases produce no elevation of pulmonary arterial pressure. On the other hand diffuse diseases of the lung such as pulmonary emphysema and diffuse pulmonary fibrosis commonly lead to pulmonary hypertension, right heart enlargement and right heart failure.

Pulmonary emphysema is the most common disease of the lungs which leads to right heart enlargement and failure. It is of particular importance because of the frequency with which it is confused with primary disease of the heart. Dyspnea is the most prominent symptom. At first the dyspnea occurs on exertion but later dyspnea may be present at rest particularly when bronchial infection is present. The dyspnea is in no way related to involvement of the heart but rather is caused by the disease process in the lungs. As a result of the loss of the normal elastic forces of the lungs the residual air is markedly increased with a corresponding reduction in vital capacity. In addition there is obstruction to flow of air in and out of the lungs as a result of the alteration in architecture of the lungs and the associated bronchial infection. In the latter stage of the disease there is marked interference with ventilation of the alveoli resulting in anoxia and retention of carbon dioxide. This interference with the respiratory function of the lungs is the eventual cause of death.

The development of pulmonary hypertension in emphysema is variable. Almost all patients with severe emphysema will have some elevation in pulmonary arterial pressure, but severe pulmonaary hypertension occurs in a minority. Marked pulmonary hypertension occurs most commonly in those patients with severe anoxia and there is reason to believe that the anoxia may play a part in the production of the pulmonary hypertension.

Evidence of right heart enlargement is best obtained from the electrocardiogram although caution must be exercised in interpretation because of the positional changes which are commonly present. Evidence of gross cardiac enlargement on the roentgenogram of the chest is usually absent except in the presence of marked right ventricular failure. The circulation time is usually normal even in the presence of right heart failure. This is because the cardiac output is normal or even increased.

The diagnosis of right heart failure in patients with emphysema is often frought with difficulty and uncertainty. As mentioned previously dyspnea and cyanosis are symptoms of the pulmonary disease and are in no way related to heart failure. Edema of the lower extremities is commonly seen in pulmonary emphysema. The edema does not always seem to be related to cardiac failure. Often it results from prolonged dependency of the legs. Because of the severe dyspnea the patients may remain in a chair with the legs dependent day and night. Under these circumstances one would expect some edema of the legs. The size of the liver is often difficult to evaluate because of the low diaphragms and this further complicates the diagnosis of right heart failure. The most reliable criterion of right heart failure would appear to be a definite elevation of the venous pressure.

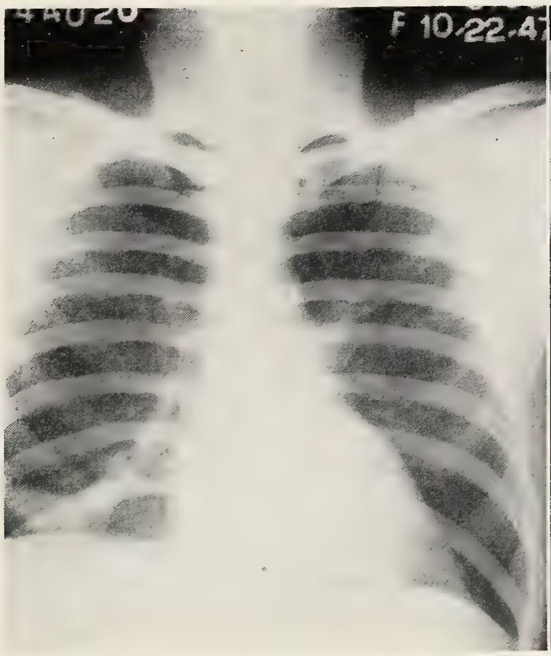

Fig. 3. Pulmonary infarction complicating congestive heart failure.

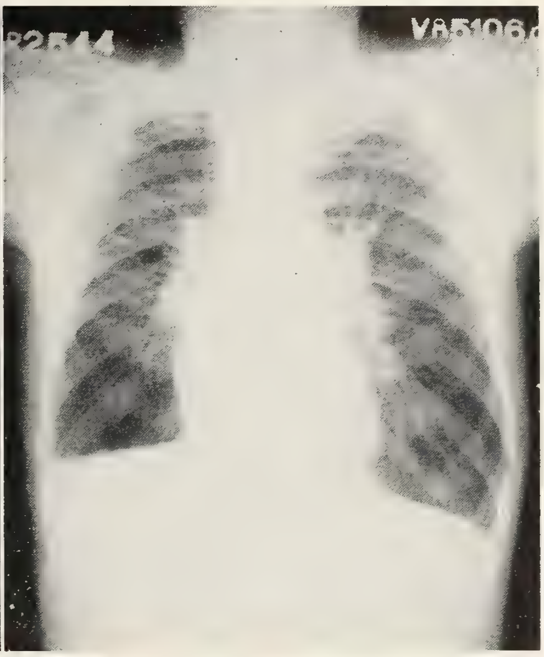

Fig. 4. Severe pulmonary emphysema with cor pulmonale.

In the differential diagnosis of primary cardiac and primary pulmonary disease symptoms are of little value. Exertional dyspnea, nocturnal dyspnea, orthopnea, and edema may occur in both. Physical findings are of greater aid. Severe cyanosis should always suggest primary disease of the lungs or congenital heart disease with a right to left shunt. A barrel chest with limited motion and low diaphragms is usually found in pulmonary emphysema. The determination of cardiac enlargement on physical examination is of great aid. If the heart can be determined to be markedly enlarged by palpation of the apex impulse or percussion it is safe to ascribe the symptoms to primary heart failure. On the other hand if the apex impulse cannot be felt and cardiac enlargement cannot be detected by percussion one should strongly consider the possibility of the symptoms being on the basis of pulmonary disease. The roentgenograms of the chest must be interpreted with caution. In silicosis or sarcoid with extensive pulmonary fibrosis the disease of the lungs is obvious, but pulmonary emphysema may be difficult or impossible to diagnose from the roentgenogram. The size of the heart is of aid, as marked cardiac enlargement does not usually occur with pulmonary emphysema even in the presence of cor pulmonale. If cardiac enlargement is present it is right ventricular in type. The electrocardiogram is useful in that there is evidence of right ventricular enlargement in cor pulmonale whereas most types of acquired heart disease except mitral stenosis show evidence of left ventricular enlargement.

Finally, mention should be made of the use of the measurement of vital capacity in diagnosis. This is an extremely simple procedure which can be performed with an inexpensive portable apparatus.* In congestive heart failure the vital capacity is moderately reduced but extreme reduction is uncommon unless marked pulmonary edema or hydrothorax is present. Moreover in performing the vital capacity the patient can expel the air with moderate rapidity. In severe pulmonary emphysema with cor pulmonale the

History of Medicine In Minnesota

NOTES ON THE HISTORY OF MEDICINE IN WASECA COUNTY PRIOR TO 1901

B. J. GALLAGHER, M.D., and J. F. LYNN, M.D.

(Continued from the June issue)

Homer P. Dredge was born in Pleasant Mound Township, Blue Earth county, Minnesota, on August 3, 1870. He graduated from Rush Medical College, Chicago, in 1896. He located in Janesville, Waseca County, in June of 1896 and was there one year. Then he located at Bellview, Redwood County, where he remained until September, 1903, when he moved to Sandstone, Minnesota, where he still is in practice (1952).

He was married at Duluth to Miss Elma H. Freeman. Six children were born of this union, and all are living now in 1952. They are: Ethel Freeman Dredge, Librarian, Minneapolis; Florence Isabel Dredge, now the wife of Judge Earl J. Lyons, Minneapolis; Lieutenant Colonel Thomas Everett Dredge, M.D., at present on service with the army in Korea; Alice Hazel Dredge, now Mrs. Paul R. Wylie of Montana; Homer P. Dredge, a graduate of pharmacy from the University of Minnesota, and owner of a drug store at Waverly, Minnesota; Robert Morris Dredge, an employe of the National Cash Register Company and now living in Richfield, Minnesota. Dr. and Mrs. Dredge have twelve grandchildren.

M. S. Gove, the first actively practicing physician in Waseca County, was born in the town of Strafford, Orange County, Vermont, in 1829. He studied medicine in his native state, graduating in 1849. He then came west to Indiana, where he practiced until 1858, when he came to Minnesota, taking up his residence in Wilton, then the county seat of the one-year-old county. He was a public spirited man and took a great interest in all public matters. In 1859, he was elected County Commissioner, and became Chairman of the Board at its first meeting after the election. At one time, he was County Superintendent of Schools. When the Waseca County Anti-Horse-Thief Society was organized in 1864, he was its first President, and was very active in it until his death ten years later. The organization is still in existence in the county and has members down through the fourth generation. After his death, the Society resolved:

> "That we will ever cherish his memory with feelings of consideration and respect as a man of scholarship and ability in his chosen profession, a kind neighbor and a good citizen."

His professional cards appeared in the first and all the subsequent issues of the *Waseca Citizen,* which was started in Wilton, in 1860. They seem rather modest, in view of the fact that so far as is known, he was the only regular physician in the county at the time:

M. S. Gove, M.D.
Physician, Surgeon and Obstetrician
Office Broadway, next door west, Wilton House
Wilton, Minnesota
Conversant for 14 years with disease experience in hospitals and 10 years extensive practice in the west, may entitle him to a portion of the patronage.

Since he was asking for a "portion of the patronage" it would seem that he must have had competition of some kind.

He married Miss Sarah Dodge, then a teacher in the public schools of the county. They had no children.

When the town of Waseca started in the fall of 1867, after the arrival of the railroad and a movement was on soon to move the county seat to Waseca, Dr. Gove fought for its retention in Wilton. When Waseca became the county seat at the election of 1869 and Wilton was left high and dry, five miles from the railroad, he surrendered to the inevitable and moved to Waseca in 1870.

Late in November, 1874, he contracted an infection in one hand in the line of professional duty and died a few days later, on December 1, 1874. He is buried in a lonely and isolated cemetery about one-half mile south of the old Wilton Townsite.

Frank Winston Greene was born in Baltimore, Maryland, on October 5, 1853. Later his parents moved to Boston, where he grew up and went to a physicians and surgeons preparatory school, and later came to Minnesota, where he graduated from the Minnesota College Hospital in 1887. He received his Minnesota license on March 12, 1887 (1319R). At first he located in Minneapolis but in 1890 he is listed as practicing in Benson, Swift County, Minnesota, and in 1893 at Langford, South Dakota. In 1894 he came to New Richland, Waseca County, and there he lived until 1904. When Dr. Charles Dolan of Waterville moved to Worthington (after the sudden death of his brother, Dr. Edward Dolan, who had been in practice there), Dr. Greene moved to Waterville, Le Sueur County. He remained there until 1909 or 1910, when he moved to Seneca, South Dakota. In 1912, he moved to Bruno, Minnesota, and died there on April 17, 1934. He was buried at Waterville.

In 1887, he married Miss Katherine Rourke. They had two children, a son Winston D., born in 1896 and who died in 1905 at Waterville, and a daughter, born in 1904 at Waterville. She is now Mrs. O. E. Eklund, wife of the president of the State Bank of Bruno, Minnesota. They have one son, age 19 years, who is a student at Hamline University. Mrs. Greene died in Bruno in 1941 and is buried at Waterville, Minnesota.

David W. Horning filed his certificate (dated January 28, 1884) in Waseca, April 5, 1884. We have been unable to learn anything further about him here, but the Wabasha County notes in the November, 1944, issue of MINNESOTA MEDICINE, state that:

> "He graduated from the Homeopathic Medical School of Chicago in 1883. He practiced in Lake City until 1891, when he moved to Minneapolis."

He practiced in Waseca only for a year or two in 1884 and 1885, before moving to Lake City, and later in 1891 to Minneapolis. Nothing further is known about him.

William E. Hubbard, a physician of the regular school, was graduated at Rush Medical College in 1885. He received his license in Minnesota on October 27, 1885. His name is on the list as being located in Waseca about 1890, and he is remembered by at least one old-timer. He seems not to have registered his certificate with the Clerk of Court. He probably was not in Waseca for very long, and nothing further is known about him.

Eugene Hubbel, a homeopath, was graduated from the Hahnemann Medical College in 1883 and received his Minnesota license on September 18, 1884. He was located at Clearwater, in Wright County, for several years. In March, 1889, he moved to Waseca where he practiced for about a year. An old timer who remembers him, recalls that he made his calls on a high-wheeled bicycle. From 1893 until at least 1902, and probably for many years after that, he practiced at Saint Paul. He died in one of the Twin Cities only a few years ago.

Frederick N. Hunt is listed in the Clerk of Court's office in Waseca as having filed his certificate dated April 8, 1884, on June 10, 1892. He is listed in *Child's History* in 1893, as being one of the stockholders and the first cashier of the newly organized Citizens State Bank (now the First National). A personal communication from his son states that he went to Waseca from Fairmont for a year in 1892-1893, to help his uncle start a bank, that he did not practice in Waseca but went to Blue Earth in 1893, where he practiced until 1914, and then went to Fairmont. He is written up at length in the "History of Medicine in Martin County," MINNESOTA MEDICINE, October, 1942.

M. V. Hunt was one of the leading physicians of Waseca for many years. He was born in Darke County, Ohio, in 1848. He received his early education in Anderson, Indiana, where his parents moved when he was a child. He pursued his studies in Earlham College at Richmond, Indiana, where he graduated in 1867. He then matriculated at the Medical College of Cincinnati, Ohio, graduated March 4, 1872, and commenced practice at Anderson, Indiana. After a few months there, he removed to Janesville, Minnesota, and eighteen months later came to the city of Waseca. In the fall of 1879, he was elected County Superintendent of Schools, and he also served as County Coroner. He was a man of great natural ability, heightened by a superior education. In March, 1876, he married Miss Addie A. Andrews who died in July, 1887, leaving one child. He practiced in Waseca until about 1888, when he moved back to Anderson, Indiana. The date of his death is not known to us.

Attila M. Hutchinson, a homeopathic physician, was born in LeRoy, Gennessee County, New York, in 1847. When he was five years old his family moved to Fond Du Lac, Wisconsin, and there he was reared. He began the study of medicine at an early age, having a natural bent in that direction. Later he attended the Hahnemann Medical College, Chicago, where he graduated in 1877. He came to Waseca in April, 1885. While attending college, it is a matter of record that he took the first prizes on the "Theory of Practice of Medicine," and on "Diseases of the Heart and Lungs." In 1872, he married Miss Libby P. Otis of Wisconsin. They were the parents of five children. He was a member of the Minnesota Homeopathic Institute and also of the Ancient Free and Accepted Masons. He was in Waseca for a few years but it is not known just when he left or where he went.

L. E. Kuchenbecker, whose Minnesota license was dated October 12, 1893, filed it in Waseca July 7, 1900. We have been unable to find his name on any other list. Dr. J. F. Lynn, who came to Waseca in the fall of 1900 and is still practicing, does not know of him.

William A. Lang—the Freeborn County notes in the February, 1949, issue of MINNESOTA MEDICINE had this brief note only:

> "Dr. Lang located in Hartland (in Freeborn County, three or four miles south of the Waseca County line) in 1890. In 1891, he moved to New Richland (Waseca County) but came to Hartland every Thursday."

In *Child's History* of Waseca for the year 1886 it is stated that Dr. W. A. Lang was appointed County Physician for the Fourth District, so he must have been in New Richland at that time. Also in a public Medical Directory for 1886, 1890 and 1893, he is listed as a physician in Waseca County. He was a physician of the regular school and graduated from McGill University Medical Department at Montreal in 1881. It is thought that he left New Richland in the late 1890's. An edition of the *New Richland Star* in 1886 has this note:

> "Dr. W. A. Lang, graduate of a Montreal Medical College, located here about two years since, has by his skillfulness in his profession and his careful attention to the minor complaints, secured a firm hold upon the confidence of our citizens, and has a reputation second to none."

Nothing more is known about him.

James B. Lewis was born in Lancaster, Pennsylvania, December 18, 1855. Later the family moved to Reading, Pennsylvania. He graduated from the Medical Department of the University of Pennsylvania in 1878. He came to Minnesota in 1885, and was licensed on November 7, 1885 (1123R). He located in Saint Paul, and on June 16, 1886, he married Miss Lily B. Lienau of Saint Paul. They had a son and a daughter, both living in South Saint Paul at the time of this writing (1952). The daughter, Marguerite (Mrs. S. B. Ferguson) is Executive Secretary of Family Service of South Saint Paul; the son, Charles S. Lewis, is retired.

In 1894, the Lewis family moved to Waseca, where Dr. Lewis practiced until 1900. Then he moved to St. James, where he remained until 1910, when he located in South Saint Paul. After that he was Coroner of Dakota County for three terms.

The later years of his life were spent in semi-retirement. He traveled a great deal. He was an ardent sportsman, doing much hunting, but as he grew older gave that up for the milder sport of fishing. On July 27, 1924, he died in his sleep while on a fishing trip on Whitefish Lake, Jenkins, Minnesota. He was buried in Acacia Park Cemetery, Mendota. He was a member of the Episcopal Church, the Masons, and the Ramsey County, Minnesota State and American Medical Associations.

James F. Lynn was born in Loudoun County, Virginia, April 20, 1871. He received his primary education in the country schools, three miles from his home. He went then to William and Mary College at Williamsburg, Virginia, after which he taught a country school for two years. He then took academic courses at the Richmond College, preliminary to pursuing the study of medicine at the University College of Medicine, Richmond, where he finished with distinction in 1896. Later he continued his medical studies in New York at the New York Polyclinic and Hospital where he received advanced degrees. He practiced medicine in

Richmond for two years, at the same time acting as demonstrator of anatomy at the University College of Medicine.

He came to Waseca in August, 1900, and established the practice of medicine, which he is carrying on at the present time (1952).

Several years ago, a friend wrote the following tribute to Dr. Lynn:

> "Dr. Lynn is steadfast and loyal, having the confidence of businessmen, laboring men and farmers. He has been a success and a leader in his profession. As a physician, he has been a leader in health work in his community. He has been president of the Waseca County Medical Society at different times. In May, 1917, President Wilson appointed him medical member of the Waseca County Draft Board. These duties he faithfully performed at a great sacrifice to his medical practice. This work he continued for over a year, until the need for doctors in the Overseas American Army became so great that he resigned and enlisted. He was immediately appointed Captain in the Medical Corps, and after a brief training in the United States, he was sent overseas to France. There he served as Chief of the Medical Service with Base Hospital 107 A.E.F., until his return to the United States in June, 1919. He was released from the army with a honorable discharge July, 1919.
>
> He helped to organize and was one of the charter members of the Waseca American Legion Post. In 1922 and also in 1928, he was the Democratic nominee for Congress in the First Minnesota District. In both campaigns he put up a courageous, militant fight, and while not elected (this district being a stronghold of the Republicans) he made a creditable showing, each time receiving more votes for that office than any other Democrat had ever done before or since. All this was done at a great personal sacrifice. It cost him a lot of money and he lost a lot of time from his business. He was one of the twenty-one Minnesota delegates elected to the Constitutional Convention for the repeal of the 18th Amendment. He was Chairman of the Roosevelt Business and Professional League for Waseca County; Chairman of the Roosevelt and Garner Club for the city of Waseca; and Chairman of the Waseca County Democratic Committee for two years. He has also served as a member of the Waseca School Board and Chairman of the Waseca Charter Commission. These are not all the things he has engaged in for the good of the community, the State and the Nation, but it is sufficient to give you at least in part the picture of the kind of man he is."

The Genealogy of James F. Lynn, M.D.

Great, Great Grandfather, John Lynn	born 1729
Great Grandfather, Fielding Lynn	born 1763 died 1794
Great Grandmother, Ruth Fristoe Lynn	born 1772 died 1833
Grandfather, James Fristoe Lynn	born 1806 died 1864
Father, Bushrod Washington Lynn	born 1842 died 1917
Mother, Frances Allen Lynn	born 1844 died 1908
Dr. James Fristoe Lynn	born 1871

He married Miss Jessie Helms on January 28, 1904, and they have two sons. James F. is married, lives in Owatonna, and has three children. Robert Lee is married, lives in Saint Paul, and has two children.

Dr. Lynn's hobbies are riding horses and photography. He is still City Health Officer for Waseca (1952).

(To be Continued in the August issue)

President's Letter

PUBLIC HEALTH—MEDICINE'S EXTRA EYE

Just as many mothers sometimes need three arms to accomplish all their duties, so medicine needs an extra "eye" to keep watch over the health of the nation's people. The field of public health has long offered that extra "eye" for doctors of medicine.

The benefits from action in the interest of public health have been of extreme value to the medical profession as well as the public. Doctors of Minnesota will again have an opportunity to avail themselves of latest scientific developments in public health this October, when the sixth annual Minnesota Public Health Conference will convene. The dates are October 2 and 3, and the place is the Saint Paul Hotel.

Anyone who has attended the previous conferences, knows from first-hand experience, that their opportunities are many and varied.

The Minnesota Public Health Conference, an official affiliate of the American Public Health Association, provides a forum for the discussion of vital public health problems. It brings together representatives of medicine, nursing, dentistry, pharmacy, engineering, and veterinary medicine. The continuing co-operation and participation of these groups have helped make the conference an extraordinarily successful means of pin-pointing problems and emerging with machinery to resolve them.

A resolution promising the medical profession's aid and support in this conference was passed at the 1951 House of Delegates' meeting. Thus, we have a vital stake in the public health conference, not only through the working organizational committees, House of Delegates, officers and Council of the Minnesota State Medical Association, but through the individual physicians of the state as well.

I should like to urge physicians of Minnesota to do their part in keeping that extra "eye"—public health—an alert one. Its sharpness depends greatly on participation and co-operation from the medical profession. The Minnesota Public Health Conference should be a "must" on the calendar of all public-minded doctors. It will be concrete evidence of your continuing efforts to improve the already high health standards for the people of your state and nation.

Roger L J Kennedy

President, Minnesota State Medical Association

DIRTY POLITICS—H.R. 7800

IT seems worthwhile to relate the sequence of events that led up to the defeat by Congress of the bill designated as H.R. 7800. The story is an example of tricks that are played to get bills passed without due deliberation—bills which, if passed, would give added power to the powers that be and, if defeated, would afford an opportunity to discredit the opposition. This can be correctly termed—dirty politics.

A bill to amend Title II of the Social Security Act was introduced in Congress on Monday, May 12, 1952, and referred to the House Committee on Ways and Means. Printed copies of the bill were not available until Wednesday, May 14. The bill was considered immediately by the committee and reported favorably on Friday, May 16, without public hearings and with the request that action be taken on Monday, May 19, under suspension of rules. This meant that debate was to be limited to forty minutes and no amendments were to be allowed. Such undue haste should have been enough to have aroused suspicion and investigation. It did.

The bill provided for an increase in old age and survivors pensions. However, Section 3 of the bill provided that the Federal Security Administrator (Oscar Ewing at the present writing) should: (1) provide by regulation when and where physical examinations should be taken; (2) be authorized to prescribe the examining physician or agency; and (3) establish the fees. Quite an addition to the considerable authority already invested in the Federal Security Administrator.

While the bill did not establish permanent and total disability benefits, it established a precedent and framework for the adopting of such benefits in the future. In view of this dangerous precedent and the immediate control which Section 3 of the bill would vest in the Federal Security Administrator, the AMA opposed its adoption.

The AMA did not object to the portion of the bill which provided for an increase in Social Security payments, but it did object to Section 3 which would have put the government's foot in the door of socialized medicine.

The facts indicate that a sneak procedure was used by the Social Security Agency to get Section 3 "written in" an otherwise acceptable bill.

The AMA was taken to task by President Truman for having defeated the bill which would have increased payments in Old Age and Survivors Insurance benefits. This was probably true, for when the undesirability of Section 3 was called to the attention of Congress, the bill failed to pass by a two-thirds majority required under the suspension of rules.

Unless the story of bill 7800 is known, the opposition of the AMA might well put the physicians of the country in an unfavorable light in the eyes of Old Age and Survival beneficiaries. A statement by the AMA secretary let it be known that the AMA would not oppose a bill providing in a straight-forward way for an increase in payment to Social Security beneficiaries with no trick riders. The same bill was resubmitted and passed by the House with only twenty-two adverse votes. The bill is still opposed by the AMA, and it is to be hoped will be killed in the Senate.

STATE MEDICAL ASSESSMENT

THE House of Delegates at its meeting May 26, 1952, during the annual meeting of the Minnesota State Medical Association, voted to assess each active member $10 for the year 1952, effective immediately.

The association has been calling upon its reserves since 1949, in larger amounts each year, so that it has little reserve left. The dues have not been sufficient for the needs incident to the expanded field of activities. Provision for scholarships of $1,000 a year for medical students from communities of less than 5,000 population will soon add $4,000 yearly to the association's expenditures. Inflation has practically doubled the office salary item. An important factor in the picture is the reduction in membership from 3,100 as of January 1, 1950, to about 2,600 as of May 1, 1952, due to many physicians taking advantage of the non-dues paying life membership and the large number temporarily serving in the armed forces.

A letter from the state office which has gone out to each member calls attention to the fact that the new assessment of $10 added to the present $30 is still less than the dues of $50 paid in Iowa, Nebraska, North and South Dakota and the $60 paid in Wisconsin.

The assessment is payable at once directly to the Minnesota State Medical Association office at 496 Lowry Medical Arts Building, Saint Paul 2, Minnesota.

TREATMENT OF RHEUMATIC FEVER

Much has appeared in the literature regarding the use of ACTH and cortisone in the treatment of rheumatic fever. Editorial mention* has been made of the apparent prompt abatement of the symptoms and laboratory evidence of activity of the disease following the use of these two drugs but that their affect on the over-all picture of the heart disease frequently accompanying the disease had yet to be proved. A warning was issued against the indiscriminate use of the two drugs.

The question of practical importance as to whether ACTH and/or cortisone should replace the salicylates in the treatment of rheumatic fever has apparently not yet been settled. According to a recent release of the American Heart Association the remedies mentioned have been and are being studied in some thirteen research centers in the United States, Canada and Great Britain in a co-operative effort to evaluate the new drugs in comparison with the salicylates. Funds for the study have been supplied by the National Heart Institute of the U. S. Public Health Service, the British Research Council, the American Heart Association, the Canadian Arthritis and Rheumatism Society and various hospitals and medical centers. The ACTH has been supplied by Armour and Company and cortisone by Merck and Company.

The study has been going on since January, 1951, and the preliminary report on the first 302 of the 658 patients studied states that there is no difference in the time required for the acute symptoms to subside after the administration of ACTH, cortisone or aspirin and no conclusions are so far justified as to the drug most effective for the control of the acute illness. No information is yet available on the comparative effectiveness of the three drugs in preventing chronic heart disease.

Until some proof is forthcoming that ACTH or cortisone are superior to the salicylates in the treatment of rheumatic fever and until their side effects are better understood, the practitioner would seem justified in adhering to the salicylates for the treatment of this disease and leaving further trial of ACTH and cortisone to the research centers.

DR. LAWRENCE RETIRES

A testimonial dinner was given Dr. Joseph S. Lawrence, retiring head of the legislative office of the AMA in Washington, on Sunday, June 8, at the Palmer House in Chicago. Some 200 officers of the AMA and state medical associations attended the dinner in honor of the physician who for the past eight years has held a difficult assignment and has conducted it in a dignified and effective manner. Starting with an office consisting of one room and one employe, it now has a personnel of sixteen.

Dr. Lawrence had a background of twenty years of legislative experience in New York State as a representative in Albany of the State Medical Association. His office in Washington was first under the Committee of Public Education of the AMA. Later it became directly responsible to the Board of Trustees before being placed under the Committee on Legislation, headed first by Dr. Dwight Murray and now by Dr. Blasengame of Texas.

The AMA office in Washington has been accused of being a doctors' lobby. As a matter of fact, the office is a two-way information bureau, supplying information on legislative matter to the profession throughout the country and medical viewpoints to anyone in Washington who requests them. The office is in no sense a lobby. According to Dr. Lawrence's own statement, he has never asked any legislator to vote for or against any measure.

Dr. Lawrence deserves the thanks of the profession for having handled a difficult assignment well.

Physicians can stimulate community participation in X-ray surveys by setting a good example themselves. It would be gratifying if every hospital required that staff members have a chest X-ray, at least twice a year. The Children's Memorial Hospital is the first Chicago hospital to make such staff requirement. This example should be followed voluntarily by every hospital in the country. Edward A. Piszczek, M.D., *The Illinois Med. J.*, March, 1952.

Medical Economics

Edited by the Committee on Medical Economics
of the
Minnesota State Medical Association
George Earl, M.D., Chairman

FINAL APPROVAL GIVEN SCHOLARSHIP PLAN

A working plan for administering the Minnesota State Medical Association's Rural Medical scholarship fund was given final approval at the annual meeting in Minneapolis in May. The plan, main purpose of which is to assure at least one rural practicing physician a year to areas of Minnesota, was discussed and approved by the House of Delegates.

A special committee appointed to work out details of the plan of operation reported to the House of Delegates. In presenting a brief outline of the plan, the report stated:

> "The scholarship will consist of a grant of one thousand ($1000) dollars a year for four years during the time that the recipient is actually enrolled in the Medical School of the University of Minnesota. The proposal is to grant one additional scholarship to a beginning medical school student each year until four have been awarded, so that the maximum cost of the scholarships will be four thousand ($4000) dollars the fourth year and each year thereafter."

Stipulate Conditions

In order to assure that a doctor will be provided for a rural area in the state, the plan sets up certain conditions which must be agreed upon by the scholarship recipient: "The recipient, as a condition to being awarded the scholarship, must agree, at that time, that upon the successful completion of his medical education, including an internship of not exceeding two years and licensure in the State of Minnesota, to engage full time in general practice in a town of 5,000 population, or less, for a period of not less than five years. Failure upon the part of the recipient of the scholarship to do so, will make it necessary for the student to return to the scholarship fund of the Minnesota State Medical Association, the same percentage of the total grant as is represented by the uncompleted portion of the five-year period, together with interest thereon at a modest rate. For example, if the doctor serves only two years of the five-year period, he must return three-fifths of the total amount awarded him from the scholarship fund. Upon the completion of the five-year period the doctor is discharged from any indebtedness to the fund."

Plan of Selection Outlined

Certain basic requirements for the selection of medical students to receive the grant were outlined for the House by the committee. Responsibility for selection is vested in the Rural Medical Scholarship Selection committee, with advice and assistance from the University Relations committee, the Dean of the Medical School and members of the Council and such others as may be called upon by the committee. The report states:

> "(3) Among the basic requirements that will serve as a guide for this committee in awarding such scholarships will be:
>
> (a) The character of the individual.
>
> (b) The true desire of such person to study medicine and to become a practitioner of medicine.
>
> (c) Residence in a rural area or a town of less than 5,000 population, in Minnesota.
>
> (d) Willingness of student to engage in general practice for not less than five years in a town of the student's selection; the selection, however, to be made from a list to be prepared by this committee after consultation with various interested groups and individuals as the committee may determine or be directed by the Council."

Good Results Anticipated

It is hoped that final details of the plan can be completed so the committee can choose the first recipient of the scholarship for the fall quarter of 1952. The committee report emphasized that "while the plan partakes of the nature of a loan, it is an outright grant of the award to the recipient when the recipient has complied with his part of the agreement."

In avoiding hazards encountered by other states in granting scholarship awards, the committee felt that the ultimate good to be realized far outshines the somewhat cautious start the plan is undergoing. The long-range results are stated by the committee thusly: "Unlimited good to everyone concerned, including the public generally, recipients of the scholarship, and the medical profession, can result from this project."

AMA PRESIDENT LAUDS HIGH STANDARDS

Praising the American Medical Association's long fight to establish high medical standards and constantly to improve upon them, Dr. Louis H. Bauer, new president of the AMA, paid tribute to those efforts with these words in his inaugural address: "During the entire history of the American Medical Association, with just one exception, there has been no major Federal health law enacted that was not either sponsored or supported by the Association."

Dr. Bauer outlined a brief history of the association's efforts, through its committees and councils, for attainment of high standards for foods, nutrition, cosmetics, apparatus and industrial health, and other scientific areas.

In the field of medical education Dr. Bauer said, "The Association first came under heavy fire nearly a half century ago, when it began its campaign to raise the standards of medical education in this country. Medical education was at a low ebb, and it was imperative that the low grade medical schools and diploma mills existing at that time be eliminated. The campaign was successful and today we have only high grade schools of medicine in the United States. One dramatic proof of this campaign's success lies in the fact that today this country is the Mecca for medical training. Nowhere in the world is the level of medical education higher. Nowhere in the world is there a higher standard of medical care."

Stating that the AMA has more recently been equally vigilant in developments in the socio-economic fields related to medicine, Dr. Bauer felt that critics had been unjust in denying the Association's right to strive for improvements in that field as well:

> "Now, the association is told that its scientific activities are all right, but its socio-economic policies are all wrong. Twenty years ago we were criticized because we dared to question some of the developing health insurance plans. What was overlooked, of course, was the fact that no criteria had been established at that time by which to assess such insurance, and that little reliable information about it was then available. A year later we recommended experimentation in that field, and listed safeguards to be included in plans for the protection of patients. As a result, Voluntary Health Insurance has become the fastest growing insurance project in history, and is providing a sound means for prepayment of the major costs of illness. Yet, now we are vilified because we do support it and because we continue to oppose Compulsory Health Insurance."

Promises Continuing Efforts

As the association's leader for the coming year, Dr. Bauer pledged the medical profession to continuing efforts to raise medical and health standards for America. He stated that it is not enough that America has the world's highest standards of medical care, but that this type of service must reach the entire population. He urged expansion of public health facilities, and co-operation from all concerned to solve any problems, so that large numbers of people shall not be without proper environmental sanitation, protection against communicable disease and protection of their food, milk and water supplies. He urged physicians to work for forward-looking plans for the care of chronic invalids and programs for the medical care of the indigent. He noted that studies of medical care are constantly in progress:

> "Studies of the various methods of delivering medical care are being carried on by the American Medical Association, and these studies will be continued. It becomes increasingly apparent that no one method provides the answer for every area and every group of citizens. That is one of the medical profession's objections to any government-controlled type of medical care plan. Under such a plan the same system would be imposed on every region and every individual regardless of need or local conditions."

WISCONSIN EDUCATOR ADDRESSES STATE MEETING

"One of the disturbing aspects of the contemporary scene is the fact that in steadily pushing frontiers in the field of science ahead at an accelerated pace, we have widened the gap between technological achievement and man's adjustment to that achievement."

That theme was presented by Dr. J. Martin Klotsche, president of Wisconsin State College in Madison. Dr. Klotsche spoke at the annual banquet of the Minnesota State Medical Association on May 27.

Dr. Klotsche said that Americans cannot record

◆ Reports and Announcements ◆

AMERICAN COLLEGE OF SURGEONS

The thirty-eighth annual Clinical Congress of the American College of Surgeons will be held at the Waldorf-Astoria in New York City from September 22 to 26, 1952.

Surgeons from all parts of the nation and a number of foreign countries will assemble to take advantage of the program which will include clinics, postgraduate courses, forums, panel discussions, color television and scientific and technical exhibits. Some sixty-two hospitals in the New York area will participate in the program of operative clinics and demonstrations.

At the presidential meeting, September 22, Dr. Alton Oschner of New Orleans will give the presidential address; Dr. Donald C. Balfour, Rochester, Minnesota, will give the seventh Martin Memorial Lecture on "The Evolution of Gastric Surgery" and Dr. Harold Foss, Danville, Pennsylvania, will be installed as president for 1953. At the convocation, September 26, Sir Cecil Wakeley of London, president of the Royal College of Surgeons, England, will give the Fellowship address.

Headquarters of the College are at 40 East Erie Street, Chicago.

MINNESOTA VALLEY GENERAL PRACTITIONERS AND RENVILLE COUNTY SOCIETY HOLD JOINT MEETING

At a joint meeting of the Minnesota Valley chapter of the American Association of General Practitioners held in Renville in May, the need for more trained nurses and the importance of the general practitioner in small communities were the main points of discussion.

Dr. Willis L. Herbert, general practitioner at St. Mary's Hospital, Minneapolis, was the feature speaker of the meeting. He gave the keynote of the meeting in stating that the AAGP is doing much to keep general practitioners from being replaced by specialists.

Dr. James Cosgriff, Sr., president of the AAGP unit and a member of the State Board of the AAGP, said "The public deserves a general practitioner" in defense of the country doctor as opposed to the specialists in metropolitan areas.

At the business session, Dr. W. E. Hines of Willmar was elected to succeed Dr. Cosgriff as president. Elected as secretary was Dr. James Cosgriff, Jr. of Olivia.

CONTINUATION COURSE IN ROENTGENOLOGY

The University of Minnesota will present a continuation course in *Gastro-Intestinal Roentgenology for Radiologists* from October 20 to 25, 1952. The course will be presented at the Center for Continuation Study on the University campus and will cover all aspects of roentgenologic examination of the gastro-intestinal tract.

The distinguished visiting faculty members will include: Dr. Olle Olsson, Professor, Department of Diagnostic Roentgenology, University of Lund, Lund, Sweden; Dr. Richard R. Schatzki, Chief, Department of Roentgenology, Mt. Auburn Hospital, Cambridge, Massachusetts; Dr. Frederic E. Templeton, Professor, Department of Radiology, University of Washington Medical School, Seattle; Dr. Paul C. Swenson, Professor, Department of Radiology, Jefferson Medical School, Philadelphia, Pennsylvania, and Dr. Leon Schiff, Associate Professor, Department of Medicine, University of Cincinnati College of Medicine, Cincinnati, Ohio.

On Wednesday, October 22, the Annual Leo G. Rigler Lecture will be presented by Dr. B. J. Kirklin, Professor, Department of Radiology, Mayo Foundation, Rochester.

The course will be presented under the direction of Dr. Leo G. Rigler, Professor and Head, Department of Radiology and Physical Medicine, and the remainder of the faculty will include members of the clinical and full-time faculty of the University of Minnesota Medical School and the Mayo Foundation.

LYON-LINCOLN COUNTY SOCIETY

Members of the Lyon-Lincoln County Medical Society entertained the attorneys of the two counties at a dinner in Chuck's cafe, Hendricks, on June 2. Speaker of the evening was a Minneapolis attorney, R. A. Scallen, who gave a very informative talk on "The Doctor in Court." Thirty-five members and guests were present. This has become an annual occasion among the legal and medical men of these two counties over the past few years.

SAINT LOUIS COUNTY SOCIETY

The second annual press conference of the Saint Louis County Medical Society was held May 23 in St. Luke's Hospital, Duluth. Duluth and Iron Range newspaper representatives were in attendance.

Sessions started with a panel of medical men and hospital administrators, Dr. Martin O. Wallace acting as moderator. Richard Fox, assistant administrator of St. Luke's and Sister Loretta, St. Mary's Hospital administrator, discussed "Facts about Hospital Costs." Dr. Earl Barrett, Duluth pediatrician, spoke on "Modern Methods for Salvage of Premature Infants." A motion picture entitled "The Romance of Aureomycin" was shown by Harry Haney.

The conference ended with a banquet in the Kitchi Gammi Club. Principal speaker was Dr. William P. Shepard, San Francisco, vice president of the Metropolitan Life Insurance Company. His subject was "Public Health and Socialized Medicine." Dr. L. R. Gowan was banquet toastmaster.

Honored at the banquet was Dr. Albert J. Chesley of Saint Paul, director of the Minnesota Department of Health, who has completed fifty years of service in the medical field.

RESEARCH IN THE SERVICE OF MEDICINE SEARLE

SOUTHERN MINNESOTA MEDICAL ASSOCIATION

The annual meeting of the Southern Minnesota Medical Association will be held at Austin on Monday, September 8.

The following program will be presented:

Program

Morning Session

1. "Migraine: Diagnosis and Treatment"
   Gustavus A. Peters—Rochester
2. "Physical Symptoms of Depression"
   William S. Chalgrin—Mankato
3. "Use of Compound F in the Treatment of Posttraumatic Bursitis of the Knee and Ankle"
   E. D. Henderson—Rochester
4. "Treatment of Cutaneous Malignancies"
   L. M. Hammar—Mankato
5. "Urgent Surgical Conditions in New Born Period"
   A. B. Hayles—Rochester
6. "Problems of Diseases of the Thyroid other than Hyperthyroidism"
   Martin A. Nordland—Minneapolis
7. "Melanin Spots of the Lips, Buccal Mucosa, and Digits with Associated Intestinal Polyposis"
   Lloyd F. Sherman—Minneapolis
8. "Management of Cases with Leakage from Duodenal Stump after Partial Gastrectomy"
   C. E. Rea—St. Paul
9. "The Responsibility of the Practising Physician and Health Department in the Case of the Aged"
   Robert N. Barr—Minneapolis

Afternoon Session

10. "Freedlander's Pneumonia—Case Report"
    John P. Dahlstet—Mankato
11. "Dissecting Aneurysm: Physical and Autopsy Findings—Case Report"
    Edwin J. Benjamin—Minneapolis
12. "Methods of Internal Fixation in Operative Treatment of Fractures of the Hip and Shaft of the Femur—Case Report"
    Harold J. Anderson—Austin
13. "Danger of Use of Cortisone in Acute Rheumatic Fever and Concurrent Renal Damage"
    C. H. Scheifley—Rochester
14. "Perforation of Rectum with Unusual Complications—Case Report"
    W. C. Bernstein—St. Paul
15. "Coronary Insufficiency"
    Burtis J. Mears—St. Paul
16. "Doctors' Disagreements in Court"
    Joseph C. Michael—Minneapolis
17. "Neurosurgical Treatment of Intractable Pain Due to Metastatic Carcinoma"
    H. J. Svien—Rochester

NORTHERN MINNESOTA MEDICAL ASSOCIATION

The Northern Minnesota Medical Association will hold its annual meeting at Crookston, Minnesota, Friday and Saturday, August 22 and 23. Officers of the association are: Dr. George Sather of Fosston, president; Dr. W. S. Neff of Virginia, vice president; and Dr. C. L. Oppegaard, of Crookston, secretary-treasurer.

The scientific program to be presented is as follows:

Friday, August 22

A.M. *Morning Session*

9:00 "Diagnosis of Subdural Hematoma, Particularly in Children"
Gordon J. Strewler, M.D., Duluth

9:45 Discussion Period

10:00 "Psychiatric Treatment for the Neurotic Patient"
John E. T. Haavik, M.D., Duluth

10:45 Discussion Period

11:00 "The Management of Endometriosis"
John E. Faber, M.D., The Mayo Clinic, Rochester

12:00 Business meeting

P.M. *Afternoon Session*

2:00 "Certain Aspects of Biliary Tract Surgery"
Richard L. Varco, M.D., University of Minnesota, Minneapolis

2:45 Discussion Period.

3:00 "The Insurance Aspects of Heart Disease"
Harry E. Ungerleider, M.D., Director of Medical Research, Equitable Life Assurance Society, New York, N. Y.

3:45 Discussion Period.

4:00 "Prevention and Treatment of Respiratory Tract Infections."
Hobart A. Reiman, M.D., Philadelphia, Pa.

Evening Program

7:00 Annual Banquet
Address: "An American Looks at Asia"
Morris Wee, D.D., First Lutheran Church, Duluth

Saturday, August 23

Morning Session—9:00-12:00 Noon

Clinico-Roentgenological-Pathological Conference
Conducted by Henry Moehring, M.D., of Duluth and associates.

A full program of entertainment has also been planned for members of the Ladies' Auxiliary.

AVOID "OVERTREATMENT DERMATITIS"
"Overtreatment dermatitis is today a prevalent and often disabling cutaneous disturbance."*

To open congested air passages in hay fever

NEO-SYNEPHRINE®

HYDROCHLORIDE

. . . reduces nasal engorgement . . . relieves soreness

. . . promotes aeration . . . encourages drainage

A few drops of Neo-Synephrine 0.25% in each nostril will promptly check mucosal engorgement and hypersecretion, promoting greater breathing comfort over a period of several hours.

The resultant relief to the hay fever sufferer is decidedly gratifying. Prolonged action of Neo-Synephrine makes fewer applications necessary, consequently longer periods of rest and sleep are possible.

Neo-Synephrine does not lose its effectiveness on repeated application and may, therefore, be relied upon to give relief throughout the hay fever season.

Neo-Synephrine is practically free from sting and compensatory congestion; does not appreciably inhibit ciliary activity. Neo-Synephrine has been found relatively free from systemic side effects such as nervous excitation, cardiac reaction or insomnia even when tested on hypertensive, cardiac and hyperthyroid patients.[1]

Supplied **in 0.25% solution (plain), bottles of 1 oz., 4 oz. and 16 oz.; 0.25% solution (aromatic), bottles of 1 oz. and 16 oz.; 0.5% solution, bottles of 1 oz.; 1% solution, bottles of 1 oz., 4 oz. and 16 oz.; 0.125 (1/8)% solution, bottles of 1/2 oz.; 0.5% water soluble jelly, in 5/8 oz. tubes.**

Woman's Auxiliary

RAMSEY AUXILIARY AIDS REHABILITATION CENTER

The Woman's Auxiliary to the Ramsey County Medical Society has contributed a whirlpool bath to the newly enlarged Saint Paul Rehabilitation Center, which has moved to the Wilder Health Center. The new whirlpool bath will be used in the therapeutic nursery.

In accepting the gift on behalf of the Rehabilitation Center, Mr. Louis S. Headley, president, expressed his appreciation and thanks and stated: "This gift by the Auxiliary will be part of the center's permanent equipment and will provide treatment for hundreds of children throughout the years. The Auxiliary is to be congratulated for selecting this most useful gift as its community project for the years 1952-53."

The whirlpool bath will be used to provide hydrotherapy for children. The whirlpool provides a combination of heat and massage through the agitation by air of thermostatically controlled water. Its use is of particular advantage in the treatment of strains and sprains, in the rehabilitation of fractures where active and passive motion, along with heat and massage are desired, and in the treatment of other conditions where relaxation of muscles is essential.

Center Notes History

In moving into enlarged quarters, it was noted that since the opening of the center in 1948, the center has treated approximately 2,300 patients, with referrals by 330 doctors.

The Saint Paul Rehabilitation Center was originally opened in 1948 on the fourth floor of the Wilder Dispensary building on Rice street. It was sponsored and financed by the Minnesota Society for Crippled Children and Adults, the Saint Paul Junior league, and the Wilder charity to make available to the people of Saint Paul and its environs the services of physical, occupational and speech therapists upon the referral of a physician. The original staff consisted of the director, who was also the speech therapist, a physical therapist, an occupational therapist, and an office secretary.

During the first year 100 doctors referred 366 patients, who made 7,222 visits to the center.

By the end of the first year it was evident that the approximately 2,800 feet available to the center in the Wilder Dispensary Building was entirely inadequate. Although the staff had been tripled in size, the space available was not adequate for proper treatment of the patient load. The center served an approximate average of 670 patients during both the second and third years.

For the first three years the Rehabilitation Center was operated as a voluntary nonprofit association and was governed by an Executive committee made up of representatives of the three sponsors and the Family Nursing Service. In the summer of 1951 the Saint Paul Rehabilitation Center was incorporated with a representative Board of Directors of twenty-five, nine of whom represent the three sponsors.

Advisory Group Appointed

Before undertaking to establish the center, the original sponsoring committee, which was appointed by the Board of Directors of Family Nursing Service, obtained the approval of the Ramsey County Medical society and the endorsement and support of a number of leading physicians. From the beginning, the center has had the benefit of the advice and counsel of a medical advisory committee, which at present is made up of Dr. Frank Adair, Dr. John J. Beer, Dr. Carl C. Chatterton, Dr. Harold F. Flanagan, Dr. Ernest M. Hammes, Dr. Albert F. Hayes, Dr. Alfred J. Ouelette and Dr. Hyman Lippman. The medical advisory committee acts as a liaison with the medical profession and recommends to the governing board all medical policies.

The new center is planned so that the various phases of treatment can be co-ordinated to provide the patient the greatest possible assistance toward resuming his place in the community.

In addition to the whirlpool bath contributed by the Ramsey Auxiliary, the center has three such whirlpool baths as well as a large Hubbard tank in the hydrotherapy section of the physical therapy department. The center also has a lamp room with individual treatment booths and a gymnasium.

Craft and activities for daily living will be taught in the occupational therapy department. A new kiln has been installed for the ceramics unit, and a print shop and looms have been set up in separate rooms.

The speech therapy department will have nine treatment rooms, two supplied with facilities for testing, hearing and special audio-amplifying and sound recording equipment. Two others have one-way windows for observation, important in speech training.

The remodeled Wilder Public Bath building, undertaken by the Board of Directors of the Wilder Charity, and now known as the Wilder Health Center, is owned and operated as a community service by the Wilder Charity. The entire cost of remodeling was paid by this charity and space occupied by the Rehabilitation Center and Family Nursing Service is provided rent-free. The remodeling was completed about June 1 and shortly after the Rehabilitation Center moved into its enlarged quarters which were planned and designed to meet its special medical requirements. In its new quarters it is believed to be one of the finest and most complete rehabilitation centers in this area.

It will be easier to obtain the support needed for an effective health program if it can be shown that such a program will not only enrich the individual human life but will also bring to the community which invests in health tangible economic benefits. Prevention is not only better than cure; it is also cheaper than cure. C. E. A. Winslow, "The Cost of Sickness and the Price of Health," *W.H.O. Monograph Series*, No. 7, 1951.

Delinquent Accounts

Have been recovered by us with satisfaction to the doctor and his patient.

For 51 years, we have been in the business of eliminating credit losses. Through our dignified method of contact, we accomplish two objectives:

The patient pays you directly.

Harmonious relations are reestablished between doctor and patient.

You pay only for results. Our fee is 25 per cent of the monies you so receive. There are no binding contracts or inconveniences on your part.

Let us recover monies due you by sending us your list of delinquent accounts.

In Memoriam

CHARLES DONEY FREEMAN

American dermatology lost an outstanding representative and all who knew him a loyal friend when Charles D. Freeman died on April 18, 1952.

Dr. Freeman was born in Saint Paul on January 25, 1879. He was graduated in Medicine from the University of Minnesota in the class of 1904 and served his internship in the Saint Paul Lutheran Hospital. In the company of Dr. Egil Boeckmann he then went abroad where he studied under the great dermatologic masters in Europe for two years, especially those of Vienna, Paris and London. Much of the time was spent with the eminent teacher, Max Joseph of Berlin. Returning to Saint Paul he practiced his specialty until his terminal illness began.

As an assistant professor of dermatology of the University of Minnesota, he was a diligent teacher at Ancker Hospital and the Saint Paul Dispensary.

Dr. Freeman was a member of the American, Chicago and Minnesota Dermatological societies and the first president of the latter. He was a constant attendant of the Minnesota Academy of Medicine and its president in 1933. He was a member of the Ramsey County Medical Society, the Minnesota State Medical Association, the American Medical Association and the Clinical Club of Saint Paul. He was attending dermatologist at the Charles T. Miller, St. Joseph's and St. Luke's hospitals. He originated the treatment of Kerion Celsi with solid carbon dioxide.

Dr. Freeman served as a captain in World War I.

Although he was a distinguished physician in every sense of the word, it was as an individual that he attained great esteem in the eyes of his friends. Rarely could one find a man who adhered so strictly to a rigid code of conduct. He staunchly defended his principles and friends and as vehemently condemned what he considered sham or unethical practices. He was abrupt, concise and at times caustic in his manner of speech, but was ever ready to be corrected if shown to be misinformed. He loved life and thoroughly enjoyed to sit around the festive board with his friends, who came from all walks of life. A man, if proven, was a man with Charlie and he never inquired about his origin, creed or color. He greatly enjoyed fishing, hunting and bridge and had particular companions for each.

Dr. Freeman married Caroline Boeckmann on January 1, 1910, the daughter of his greatly respected guide and teacher Dr. Edward Boeckmann and their marriage was an ideal example of devotion, understanding and mutual admiration. He is survived by his widow, a son, and two daughters: Dr. Charles D. Jr., Caroline M. (Mrs. W. D. McCall), and Helga B. He also has two grandchildren, Willard D. McCall, Jr., and Charles Freeman McCall, All live in Saint Paul.

The friendship of Charlie Freeman and the late Dr. John Butler was one of those rare companionships that became a legend. They attended all medical meetings together, they were close social friends, and they complemented each other in so many ways that they could never be thought of but jointly. Even though they had contrasting personalities, their attraction for each other began in medical school and continued unabated throughout their lives. Charlie thought of Doctor Henry Michelson of Minneapolis as his special protegé and their association was very close.

Dr. Freeman considered life an adventure which was to be experienced without regret or protest. He accepted the good with the bad and believed wholeheartedly in the supremacy of the individual. He neither sought nor would accept patronage and the mere mention of a socialized order of society brought forth his most vigorous protest.

One of the most gratifying and proud moments in Doctor Freeman's life was to see his son assume his dermatological practice in Saint Paul and, as Charlie put it "do well."

He was a grand man with many unique and lovable qualities and he will be long remembered by his many friends whose deep sympathy is extended to his surviving family.

John F. Madden, M.D.

WILLIAM FRIESLEBEN

Dr. William Friesleben of Sauk Rapids, Minnesota, died May 20, 1952, at the age of seventy-four.

Dr. Friesleben was born in Livingston County, Illinois, February 10, 1878. He obtained a B.S. degree from Valpariso, Indiana, in 1901 and an M.D. degree from the Ohio Medical College at Cincinnati in 1906. In 1907 he moved to Sauk Rapids, where he practiced continuously for the past forty-five years.

On June 30, 1946, his many friends set the day aside as Friesleben Day and paid tribute to the doctor in recognition of his long and faithful service to the community. Over 2,500 persons attended the celebration.

Besides practicing, Dr. Friesleben served many years on the Public School Board, the Benton County Fair Board, the Village Board of Health and as County Coroner. He was a past chief-of-staff of the St. Cloud Hospital and past president of the Stearns-Benton County Medical Society. He was a member of the Minnesota State Medical Association and the American Medical Association.

Dr. Friesleben is survived by his wife; a brother, Arthur, and a sister, Mrs. Emma Wunch, both of Pontiac, Michigan.

WILLIAM A. KENNEDY

Dr. William A. Kennedy, Saint Paul, died on April 30, 1952, following a long illness.

Dr. Kennedy was born August 1, 1893, in Minneapolis. He obtained his medical degree from the University of Minnesota in 1918 and took postgraduate work in the

Of General Interest

Dr. Neil S. Dungay, one of the best known and best loved professors at Carleton College, Northfield, was officially retired from the faculty as of Monday, June 30, this year.

Dr. Dungay, professor of hygiene and public health, came to Carleton in 1907. He received his B.A., M.B. and M.D. degrees from the University of Minnesota; his Ph.D. from the University of Chicago. A member of Phi Beta Kappa and of Sigma Xi, Dr. Dungay is also a member of Alpha Omega Alpha, honorary medical society, Phi Beta Pi, medical fraternity, and a Fellow of the American Association for the Advancement of Science.

He is a member of the American Medical Association, Minnesota State Medical Association and of the Rice County Medical Society. He has served as president of the North Central Section of the American Student Health Association. Dr. Dungay esablished the first organized Carleton College Health Service in 1925 and was a physician in the Health Service and its director for many years. For many years, Dr. Dungay has been a member of the Woods Hole Corporation, Cape Cod Marine Biological Laboratory.

An interesting fact in Dr. Dungay's career at Carleton is that Dean Horace Goodhue, who came to Carleton in 1867, was still at the College at the time of Dr. Dungay's appointment in 1907, thus making Dr. Dungay's and Professor Goodhue's years of service at Carleton cover the entire history of the college.

* * *

Dr. Olin West, for twenty-three years secretary and general manager of the American Medical Association, passed away June 19 at his home in Nashville, Tennessee. Dr. West retired on April 1, 1946, and had been living in Nashville since that time.

The American Heart Association announced that it has approved seventy-two grants-in-aid totaling $361,522.50 to research being conducted in twenty states, the District of Columbia, Montreal and Beirut, Lebanon. This increases to $578,172.50 the amount awarded under the National Association's research program during the fiscal year and raises to over four million dollars the total amount appropriated during the past four years.

* * *

Beginning with the January 1953 issue, the *New Orleans Medical and Surgical Journal* will become the *Journal of the Louisiana State Medical Society.* The journal has had its present name since 1844 and is one of the oldest journals in the country. As it is now the property of the Louisiana State Medical Society, the new name properly attests that it represents the profession of the entire state and not simply that of New Orleans.

Dr. Orville H. Jones, Mankato, moved his office from 303 National Citizens Bank to 1008 South Front Street on May 15, 1952.

* * *

Dr. Karl A. Meyer, president of the Cook County Graduate School of Medicine, has announced the receipt by the school of a donation of $100,000 from the Joseph and Helen Regenstein Foundation. Presentation of the donation was made on the occasion of the official opening of the school's new building located at 707 South Wood Street, Chicago, Illinois.

Notes from the AMA Meeting

In his address to the House, Speaker Francis F. Borzell, Philadelphia, revealed that the average age of a member of the House is only 59 years and that the average length of service in the House is five and one-half years. . . . The Chicago Medical Society contributed $25,000, the Woman's Auxiliary to the AMA, $10,000, and the American College of Radiology, $2,000 to the American Medical Education Foundation. . . . To save time and cover more ground quickly, Bob Lyon of the AMA business and advertising department borrowed his young daughter's roller skates and used them to coast up and down the mile-long Navy Pier, home of the scientific and technical exhibits. . . . Dr. Herbert McLean Evans, Berkeley, Calif., was the recipient of the $5,000 Passano Foundation Award for 1952. . . . Boston heart specialist Paul Dudley White made a flying trip to Chicago to accept the AMA Distinguished Service Award for 1952. . . . Dr. Charles Donatelli, Toledo, won the 1952 championship of the American Medical Golfing Association with a 36-hole score of 154 (76-78).

Doctor,
be your own
judge...
try this
simple test

With so many claims made in cigarette advertising, you, Doctor, no doubt prefer to judge for yourself. So won't you make this simple test?

Take a PHILIP MORRIS and any other cigarette

1. Light up either one first. Take a puff—get a good mouthful of smoke —and s-l-o-w-l-y let the smoke come *directly* through your nose.
2. Now, do exactly the same thing with the other cigarette.

You will notice a distinct difference between PHILIP MORRIS and any other leading brand.

PHILIP MORRIS

Philip Morris & Co. Ltd., Inc., 100 Park Avenue, New York 17, N. Y.

(Continued from Page 690)

pany of the 47th National Guard division. Dr. Benson resumed his medical practice with the Hoidale-Workman Clinic in Tracy on June 15.

* * *

Dr. Louis A. Brunsting, member of the section of dermatology of the Mayo Clinic, Rochester, and professor of dermatology and syphilology in the Mayo Foundation, left in June for a two and a half month trip in this country and Europe. Highlight of his trip will be attendance at the International Congress of Dermatology and Syphilology in London, July 21-26, as United States secretary of the Congress. He is chairman of a symposium on "Cortisone and Corticotropin (ACTH): Their Effects on the Skin and Its Diseases," and will present a paper on effects of these hormones in lupus erythematosus and other collagen diseases. He will also demonstrate an exhibit prepared in association with Drs. R. R. Kierland and P. A. O'Leary on "Cortisone and Corticotropin (ACTH): Their Use in Dermatology."

Dr. Brunsting will attend medical clinics in Edinburgh, Scotland, and on the continent. He will present papers at the Munich Dermatologic Society meeting July 5 and in Leyden, Holland, before the faculty of the University of Leyden, July 17. He will also give a clinic for medical students in Stockholm, Sweden. The Brunstings will return to Rochester, August 25.

Dr. K. A. Danford, who completed his service with the Naytahwaush Clinic, Mahnomen, in June, was honor guest at a farewell luncheon given by members of the various communities served by the Clinic, and was presented with a purse in appreciation of his "long and faithful" service. Dr. Danford, who has served as visiting physician for the Clinic during the past five years, will be succeeded by **Dr. Mildred Nordlund** of White Earth.

* * *

Dr. H. De Boer of Edgerton and **Dr. A. H. Brown** of Pipestone were awarded life memberships in the Southwestern Minnesota Medical Society at a recent meeting in Worthington. Dr. De Boer has been a practicing physician for more than forty years and Dr. Brown has practiced for more than fifty years.

* * *

Dr. James H. DeWeerd, member of the section of urology at the Mayo Clinic, Rochester, is now visiting medical centers in nine countries in Europe. Upon recommendation of the graduate committee of the Mayo Foundation, Dr. DeWeerd was named recipient of the Dr. J. William White award for foreign travel, which is given for superior achievement during fellowship in the Mayo Foundation and stipulates the completion of all requirements for an advanced degree of Master of Science in a surgical specialty. Dr. DeWeerd, accompanied by Mrs. DeWeerd, will visit medical centers in Paris, Rome, Berne, Zurich, Amsterdam, Copenhagen, Stockholm,

After All, You've Earned It

And now that you've earned it, what are you going to do with it?

(It's your money we are referring to)

First, of course, Operating Expenses must be paid . . .

Then Income Taxes . . .

Then Living Expenses . . .

Whatever remains is your Net Income, available for:

Insurance . . . Retirement . . . Savings . . . Investments . . . etc.

Your net income, wisely invested, works for you, also earns an income. What happens to this income?

Operating Expenses have already been paid . . .

So have Living Expenses . . .

Income Taxes, however, are something else . . .

If Your "Wisely-Invested" Funds Are Invested in Municipal Bonds the Income Is Exempt from All Present Federal Income Taxes.

Remember, an 8% taxable income, after taxes are paid, may be no more "net" income for you than a 3% tax-exempt income.

We can offer Municipal Bonds with yields of 3% or more.

Dr. M. E. Janssen, Crookston, was guest speaker at a meeting of the Crookston chapter of Registered Nurses late in May, talked on the administration of the new drugs and cited the nurse's responsibility with regard to intravenous therapy. Dr. Janssen is a member of the Northwestern Clinic staff.

* * *

Dr. E. B. Kinports of International Falls left in June for San Diego, California, where he will take three years of advanced medical work at Mercy Hospital. The hospital, a 350-bed institution, is operated by the Sisters of Mercy and is considered the largest in San Diego. Dr. Kinports plans to resume practice in International Falls upon completion of his study in San Diego.

* * *

The first comprehensive survey of rehabilitation facilities providing direct services for the physically handicapped was reported in June to the quarterly meeting of the Community Chest and Council of Hennepin County, Inc., by **Dr. Frank H. Krusen,** head of the Mayo Clinic section on physical medicine and rehabilitation, who directed the survey in Minneapolis and Hennepin County.

Dr. Krusen stated in his report that Minnesota has not been among the leaders in providing rehabilitation for the seriously disabled. It stands ninth from the bottom. Said Dr. Krusen, "It may be as humane to save one who is disabled from years of dependency as to save his life."

Recommendations made in the report are:

Commendation of the University of Minnesota for its establishment and planning for the division of physical medicine and rehabilitation, for training physicians and auxiliary personnel and the supervision of the rehabilitation program in University Hospitals and its affiliated institutions.

Review by the sponsoring committee, or another one specially constituted, of the information reported with the object of co-ordinating all existing facilities in rehabilitation and with the hope of eventually adding a rehabilitation center to these facilities.

Assumption of professional responsibilities for physical medicine and rehabilitation services at the Minneapolis Curative Workshop by the University of Minnesota physical medicine and rehabilitation division.

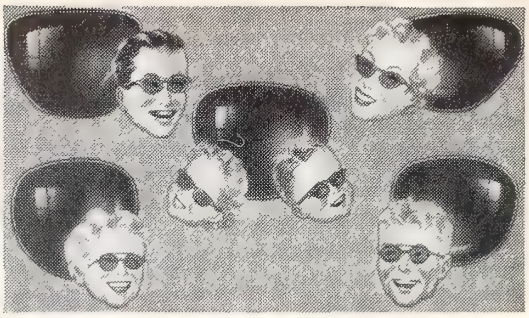
Increased budget and staff for the Minnesota division of vocational rehabilitation in the state department of education.

Special Study of problems of sheltered and homebound employment in Minneapolis and Hennepin county, with particular consideration of plans for expanding sheltered workshop facilities.

Establish a general registration of all handicapped persons.

Expand social service facilities in conjunction with rehabilitation programs.

Dr. Krusen emphasized that the first step to be taken locally should be co-ordination of existing facilities



for every patient . . .

MINNEAPOLIS 2, MINN.

Dr. and Mrs. W. E. Richardson of Saint Paul were honored at an open house in observance of their Golden Wedding anniversary in June. Dr. Richardson, a graduate of Rush Medical College in 1896, spent most of fifty years in practice in Slayton, Pipestone, and Rushford. After retiring from general practice in 1948, he served as plant physician in Morrels' Packing Plant at Sioux Falls, South Dakota.

* * *

Dr. Edward L. Tuohy of Duluth discussed "Feeding the Aged and Chronically Ill" before the eleventh annual institute of Friends of the Land, July 1, at the University of Illinois medical center in Chicago. The institute is addressed each year by scientists, health workers, soil experts, farmers and nutritionists with emphasis placed on food and soil developments.

* * *

Dr. L. A. Vadheim of Tyler, physician and surgeon in Lincoln County for more than forty years, presented a paper on "Control of Tuberculosis in Lincoln County" at the annual convention of the American Medical Association in Chicago in June. Lincoln County was the first county in the world to be accredited tuberculosis-free and the first to hold a survey and x-ray chest examinations of all persons in the county.

* * *

Dr. Kathlene Jordan of Riverside Sanatorium will visit county schools in Lyon County the latter part of September and early October for a county-wide tuberculin-testing survey. Adults as well as school children will be included in the survey, according to Dr. W. H. Valentine of Tracy, president of the County Tuberculosis and Health Association.

* * *

Dr. and Mrs. S. W. Watson of Royalton attended the meeting of the American Medical Association in Chicago in June.

* * *

While attending the annual convention of the American Medical Association in Chicago in June, **Dr. and Mrs. Harold Wahlquist** of Minneapolis celebrated their twenty-eighth wedding anniversary. They contributed $100.00 to the American Medical Education Foundation fund as a wedding anniversary gift. Mrs. Wahlquist is the immediate past president of the Woman's Auxiliary to the American Medical Association.

* * *

Dr. E. P. K. Fenger, staff member of Glen Lake Sanatorium, Oak Terrace, has been elected to the Board of the Hennepin County Tuberculosis Association. Dr. Asher White of Minneapolis was re-elected president.

* * *

Dr. and Mrs. H. H. Young of Rochester attended a combined meeting of the American and British Orthopedic Associations in London, England, in June.

HOSPITAL NEWS

At the annual meeting of the medical staff of St. Lucas Deaconess Hospital of Faribault, held in Kenyon at the home of the retiring president, Dr. R. R. Moses, on June 3, the following officers were elected for the ensuing year: Dr. Donald J. Studer, Faribault, president; Dr. F. C. Meyer, Kenyon, vice president; Dr. B. A. Orr, Faribault, secretary.

Dr. Robert Kierland, dermatologist at the Mayo Clinic, Rochester, presented a paper on "Common Skin Diseases" following the business meeting.

Members of the staff were entertained at dinner by Dr. and Mrs. R. R. Moses.

* * *

Dr. John O'Leary was elected chief of staff of Northwestern Hospital, Thief River Falls, at a meeting of the staff held in May. Dr. J. Biedermann was elected vice chairman, and Dr. Paul Wendt, secretary-treasurer.

* * *

Dedication ceremonies and open house were held in the new $750,000 addition to Fairview Hospital, Minneapolis, Sunday, May 25. Dr. J. A. Aasgaard, president of the Evangelical Lutheran church, gave the dedicatory address.

Guided tours through the new addition followed the program of speakers and musical numbers. The new building in the rear of Fairview Hospital contains surgical rooms, class rooms, a dining room, kitchen, laundry and storage facilities.

* * *

Dr. Edmund B. Flink, formerly of Cambridge, has been appointed chief of medical service of the Minneapolis Veterans Administration Hospital. He will retain affiliation with the University of Minnesota as associate professor of medicine.

* * *

Dr. John Reitmann, superintendent of the Sandstone State Hospital, has resigned and will continue his psychiatric training at Rochester State Hospital, as soon as a successor is named to fill his place at Sandstone.

BLUE CROSS-BLUE SHIELD

Minnesota Blue Shield Benefits Exceed $1,000,000 in 1952.—Over $1,237,927 in Blue Shield benefits were received by Minnesota subscribers during the first four months of this year, Arthur M. Calvin, executive director, reported after the fifth annual board meeting of Minnesota Medical Service, Inc. (the Blue Shield Plan), held in conjunction with the Minnesota State Medical Association's ninety-ninth annual meeting, May 26 to 28 in Minneapolis.

At the opening board meeting held Monday, May 26 at the Radisson Hotel, the following present officers of Minnesota Blue Shield were re-elected: O. I. Sohlberg, M.D., Saint Paul, president; Richard R. Cranmer, M.D., Minneapolis, vice president; C. A. McKinlay, M.D., Minneapolis, secretary; and E. C. Bayley, M.D., Lake City, treasurer. Doctors Sohlberg, Cranmer, and Bayley also were re-elected to the Minnesota Blue Shield Board of Directors for three-year terms. Mr. F. Manley Brist, Saint Paul attorney, is legal counsel for the Minnesota Blue Shield Plan.

"Through April 30, this year, 34,738 Minnesota sub-

WHERE ALCOHOLICS ACHIEVE INSPIRATION FOR RECOVERY

Where gracious living, a homelike atmosphere and understanding companionship contribute to successful rehabilitation.

200 acres on the shores of beautiful Lake Chisago

The methods of treatment used at the Hazelden Foundation are based on a true understanding of the problem of alcoholism. Among the founders of the nonprofit Hazelden Foundation are men who have recovered from alcoholism through the proved program of Alcoholics Anonymous and who know the problems of the alcoholic. All inquiries will be kept confidential.

HAZELDEN FOUNDATION

Lake Chisago, Center City, Minn. Telephone 83

scribers received Blue Shield benefits amounting to $1,237,926 representing 43,285 medical-surgical services," Mr. Calvin stated.

"An interesting commentary," Calvin said, "is that 66.8 per cent (23,202) of the total Blue Shield medical-surgical claims through April 30, were incurred by dependents of family contracts. Payments on behalf of dependents alone totalled over $800,000 during the first four months of 1952."

"Since 1947 (inception of Minnesota Blue Shield) $7,899,825.12 has been paid for medical-surgical claims incurred by 216,516 subscribers who received Blue Shield benefits during this five-year period," Calvin reported.

"During 1951 Blue Shield gained 112,524 participants so that on December 31, 1951, 524,257 people were covered. Through the first four months of 1952 we have continued to grow with enrollment reaching 537,820 as of April 30. The Minnesota Medical Service Inc. is now tenth largest in the United States. This I think speaks well for the co-operation of the medical profession and the need for such a program."

"In 1951, $3,095,213 was paid to the medical profession—about a million dollars more than the previous year," Mr. Calvin concluded.

Changes in Personnel and Board Directors. Medical and other friends of J. Clifford Johnson will be interested in learning that he has accepted one of the top positions in the Public Relationship Department of the Pennsylvania Blue Cross plan with headquarters in Pittsburgh. Mr. Johnson came to Minnesota Medical Service Inc. from the Massachusetts Blue Shield plan in August, 1947, and has served as Manager of the Claims Department continuously since that time. His tenure of office has included the initial organization of the plan's operation and all the intermediate stages right up to the present high point in its development. The hosts of professional, business, office and other friends he has won throughout his service in Minnesota attest his qualifications to discharge the responsibilities of his new position.

Among other changes of prominent personalities have been the selections of Dr. C. M. Bagley of Duluth, and Dr. C. W. Moberg of Detroit Lakes as members of the Board of Directors, and Dr. N. H. Baker of Fergus Falls as a member of the Corporation. With deepest regret and reluctance, the Board of Directors accepted the resignations of Dr. W. A. Coventry of Duluth, and Dr. J. F. Norman of Crookston as members of the Board, and then appointed Dr. Bagley and Dr. Moberg, respectively, to fill their unexpired terms. Dr. Baker was selected to fill the vacancy in the corporate membership created by the death of Dr. W. L. Burnap of Fergus Falls. Included also in this same group of important changes was the appointment of Dr. E. C. Bayley of Lake City to fill the unexpired term of treasurer created by Dr. Coventry's resignation.

Doctors Coventry, Norman and Burnap have been closely identified with the Blue Shield plan since the earliest days of its inception. The entire medical profession is deeply indebted to each of these founders of Minnesota's prepaid medical care program. Even the professional stature of the physicians chosen to replace them is a testimony of the invaluable contributions they have made.

On April 30, 1952, the Board of Directors authorized the appointment of Mr. Ben Stephens, Jr. to develop a physicians' and public relationship program. Mr. Stephens comes to Minnesota Blue Shield with a strong background and wealth of experience in this field. He served as a Judge Advocate General Officer in the Army during the last war, spent two to three years in personnel, claims and administrative work in the Veterans Administration and devoted eighteen months to public relations, educational and executive duties in the Graphic Arts Industry. Mr. Stephens has already put in operation the initial practices and procedures of a program which is designed to secure and maintain a better understanding of the doctors and Blue Shield of their mutual problems. However, pending replacement of Mr. Johnson, Mr. Stephens temporarily will assume the duties of Acting Manager of the Claims Department.

Recent changes to perfect the inner workings of Blue Shield and its processing of claims has been the addition of two highly qualified and experienced registered nurses as claims auditors. Headed by a particularly capable registered nurse who has been with Blue Shield in the capacity of Chief Claims Auditor for over two years, and with three highly trained, experienced and efficient claims examiners, the most technical feature of the Blue Shield claims processing has been brought to a highly satisfactory level by the acquisition of these two additional nurses.

Hidden fees imposed by federal, state and local governments on a piece of merchandise as it passes through the economy—from its raw state until it reaches the ultimate consumer—constitute a large share of the cost. The taxes on a 10-cent candy bar amount to 3½ cents. Even the kids pay heavy taxes now.

INTERRELATIONSHIPS BETWEEN CARDIAC AND PULMONARY DISEASES

(Continued from Page 671)

vital capacity is usually markedly reduced. Of great importance is the slow expulsion of the air during the performance of procedure, expiration often requiring 5 to 10 seconds. The measurement of the vital capacity together with careful clinical and roentgenographic evaluation of the patient should enable us to distinguish primary cardiac disease with secondary pulmonary changes from primary pulmonary disease with secondary effects upon the heart.

BOOK REVIEWS

Books listed here become the property of the Ramsey, Hennepin and St. Louis County Medical Libraries when reviewed. Members, however, are urged to write reviews of any or every recent book which may be of interest to physicians.

Books Received for Review

A TEXTBOOK OF PATHOLOGY. Seventh Edition. E. T. Bell, M.D., Emeritus Professor of Pathology, University of Minnesota, Minneapolis. 1008 pages. Illus. Price $12.00, cloth. Philadelphia: Lea & Febiger, 1952.

SURGERY OF THE CHEST. A Handbook of Operative Surgery. Julian Johnson, M.D., D.Sc. (Med.). Professor of Surgery, School of Medicine and Graduate School of Medicine, University of Pennsylvania; and Charles K. Kirby, M.D., Assistant Professor of Surgery, School of Medicine, University of Pennsylvania. 387 pages. Illus. Price $9.00, cloth. Chicago: Year Book Publishers, 1952.

THE HUMAN PELVIS. Carl C. Francis, A.B., M.D. Assistant Professor of Anatomy, Department of Anatomy, Western Reserve University, Cleveland, Ohio. 210 pages. Illus. Price $5.00, cloth. St. Louis: C. V. Mosby Co., 1952.

THE STORY OF THE ADAPTATION SYNDROME. Hans Selye, M.D., Ph.D. (Prague), D.Sc. (McGill), F.R.S. (Canada). Professor and Director of the Institut de Médecine et de Chirurgie expérimentales Université de Montréal. 225 pages. Illus. Flexible cover. Montreal: Acta, Inc., 1952.

INTERNAL MEDICINE: ITS THEORY AND PRACTICE, originally ed. by John H. Musser, B.S., M.D., F.A.C.P., Late Professor of Medicine in the Tulane University of Louisiana, School of Medicine, New Orleans, La. 5th ed. ed. by Michael G. Wohl, M.D., F.A.C.P., Associate Professor of Medicine, Temple University School of Medicine; Chief of Nutrition Clinic, Philadelphia General Hospital; Chief of Endocrine Clinic, Temple University Hospital. With 80 Contributors. 1563 pages. Illus. Cost $15.00. Philadelphia: Lea & Febiger, 1951.

This new edition of Dr. John Musser's original book was well received and gave much enjoyable reading to the reviewer. The new popular two-column format is restful even after several hours of reading.

The various authors have divided their discussions of the individual diseases in a similar manner throughout the book. This makes it a more rapid job to use this book as a reference for reviewing one particular aspect of a disease.

The relative dearth of illustrations in this book is compensated for by the quality of those included and the good descriptions in the text itself. Suggested therapy is included for most diseases and is up to date. The use and misuse of ACTH and cortisone is well described for the appropriate diseases.

A new chapter on "Genetics and Medical Practice" has proved useful for a consultation during the period of reviewing this book. It gives ready help to those questions parents and friends of abnormal offspring often bring to the physician. The other new chapters are much needed and include: the general adaptation syndrome, antibiotics and chemotherapy, rehabilitation of the chronically ill, geriatrics and the psychosomatic aspects of medical practice.

This new edition should continue to be a favorite in the libraries of all practitioners—both general and specialists.

IN MEMORIAM

WILLIAM A. KENNEDY

(Continued from Page 688)

special senses at the University of Edinburgh and the Mayo Clinic.

He was a former chief-of-staff of St. Joseph's Hospital in Saint Paul and a former member of the advisory board of the hospital. He was a member of the Ramsey County Medical Society, the Minnesota State Medical Association and the American Medical Association. He was also a member of the Saint Paul Clinical Club, the University Club of Saint Paul and the Serra Club. During World War I he went overseas as a medical officer with Base Hospital 26.

Dr. Kennedy is survived by his wife, Helen, and two daughters, Mary Francis and Mrs. J. Thomas Simonet. A brother, John, lives in Minneapolis, and a sister, Mrs. Fred Huntington, in Los Angeles.

MEDICAL ECONOMICS

(Continued from Page 681)

advances in the field of human relations comparable to the colossal strides made in technology. "Actually there is no reason why this should be so," Dr. Klotsche went on, "for our fundamental beliefs and ideals provide us with a basis for making it possible for human beings to live together harmoniously." That basis is the "belief that every individual possesses dignity and worth and has the right to be considered a person at all times regardless of race, color, creed, economic status or political belief."

Multiplicity an Asset

Dr. Klotsche told doctors and their guests that America is one nation which has taken advantage of its contrasts and has actually cultivated its own multiplicity to the point where it is an asset. He concluded, "America is a land made up of many nationalities, races, traditions and faiths. It was born in diversity and has prospered and grown because we have cultivated multiplicity. . . . The United States is large. It does contain multitudes. But it is this incorrigible pluralism that has given us such great vitality. This diversity confounds the stranger in our midst, bewildered by the existence of persons of so many different races, nationalities, and creeds. But to us this diversity is no problem at all. It is in fact our greatest asset."

EVANSVILLE IND., U.S.A.

AS NUTRITIONALLY SOUND...

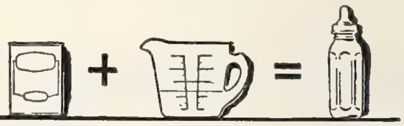
The generous milk protein content of Lactum provides for sturdy growth and sound tissue structure. Dextri-Maltose® supplements the lactose of the milk so that energy needs may be met, fat properly metabolized, and protein spared for its essential functions.

For more than 40 years, milk and Dextri-Maltose formulas with the approximate proportions of Lactum have been used with consistent clinical success. Infants fed Lactum* show good tolerance of feedings, low incidence of digestive disturbances and infections, satisfactory growth response and a generally excellent picture of health and development.

*Frost, L. H., and Jackson, R. L.: J. Pediat., 39:585-592 (Nov.) 1951

AS IT IS CONVENIENT

Mothers appreciate the ease of Lactum's simple 1:1 dilution. It assures accurate measurement. Lactum is ideal also for supplementary and complementary feedings, and whenever single feedings are indicated.



Simply add 1 part Lactum... to 1 part water... for a formula supplying 20 calories per fluid ounce.

A way to lose money in a hurry

When you are flat on your back with your income cut off and with bills accumulating in increasing amounts as a result of a sickness or accident it's mighty easy to lose money—and in a hurry. In addition to that, the expense of maintaining you and your dependents continues.

The bright thing about the picture is that it's easy to insure your income assuring stability and maintenance of saved capital. It would be smart to insure in an investigated and tested plan, one that is available through your own Society. Apply now!

Pyribenzamine®
unsurpassed

as an antihistaminic agent

And the same is true in the many other allergic manifestations in which antihistamines are prescribed: *allergic rhinitis, serum sickness, angioneurotic edema, drug reactions, and itching skin conditions such as atopic and contact dermatitis and urticaria.* Recognized for its excellent therapeutic effectiveness and wide range of usefulness, Pyribenzamine is prescribed today as it was when it first became known *for maximum relief with minimal side effects.*

"therapeutic bile" overcomes stasis

what is "therapeutic bile"?

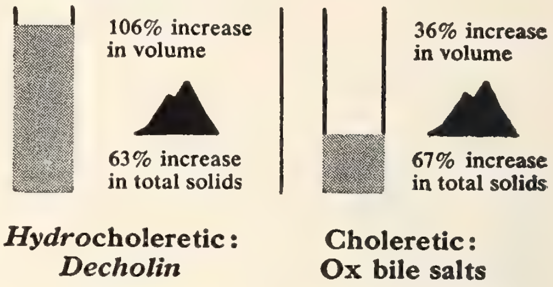
Thin, free-flowing bile in copious amounts as produced by *hydro*choleresis with *Decholin.*

what does "therapeutic bile" do?

Overcomes stasis in chronic cholecystitis and noncalculous cholangitis by flushing thickened bile, mucus plugs and debris from the biliary tract.

how does "therapeutic bile" differ from other bile?

"THERAPEUTIC BILE" is higher in fluid content and lower in solid content than bile produced by choleretics, e.g., ox bile salts.



DECHOLIN®

(brand of dehydrocholic acid)

how is "therapeutic bile" obtained?

"THERAPEUTIC BILE" is obtained by adequate dosage of *Decholin* and *Decholin Sodium.* Most patients require one or two tablets t.i.d. for four to six weeks. Prescription of 100 tablets is recommended for maximum efficacy and economy. More prompt and intensive *hydro*choleresis may be achieved by initiating therapy with *Decholin Sodium* 5 cc. to 10 cc. intravenously, once daily.

Decholin Tablets, 3¾ gr. (0.25 Gm.),
bottles of 100, 500, 1000 and 5000.

Decholin Sodium (brand of sodium dehydrocholate)
20% aqueous solution, ampuls of 3 cc., 5 cc. and 10 cc.

The $64,000,000,000 Question Is

Why do Professional people think their accounts are different from commercial accounts? Our answer is "No Difference."

Your patients have the same jobs
Your patients have the same income
Your patients have the same debts
Your patients have the same habits
Your patients have the same excuses

Commercial enterprises collect systematically, leaving the Professional class holding the bag.

The wheel that squeaks gets the grease.

Psychological warfare commences immediately upon your forwarding your accounts for credit control and collection service.

The services offered by the Professional Credit Protective Bureau "Division of I. C. System" have been adopted by over 50 trade associations extending from coast to coast.

After twelve years in the liquidation of professional accounts receivable, you will be able to benefit by our experience.

Not A Collection Agency — All Monies Paid Directly To You

COST less than collection through your own efforts and in most cases one-half of usual collection agency fees.

Operates with extreme courtesy and goes to the fullest extent the law permits.

Our contention is that this is the outstanding credit control and professional collection service in the United States.

- NO ASSIGNMENT OF ACCOUNTS
- RETAINS PATIENTS' GOOD WILL

When you want money bad—we offer a service that is good!

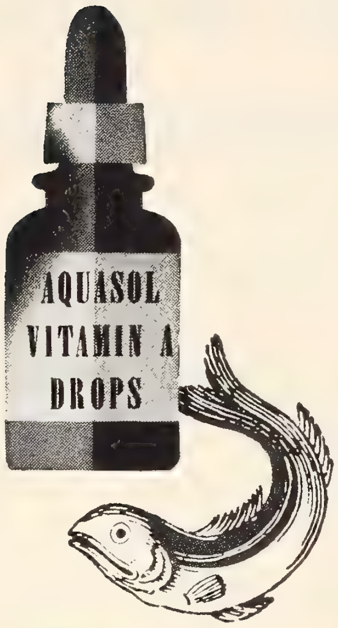
aqueous
vitamin A



THE **FIRST** AND **ORIGINAL** ACCEPTED BY THE COUNCIL

AQUASOL VITAMIN A DROPS

Aquasol Vitamin A Drops provides
50,000 U. S. P. units of natural vitamin A
per gram in aqueous solution.

Aqueous solutions of vitamin A . . . as available in Aquasol Vitamin A Drops . . . are more rapidly absorbed than vitamin A in oil solutions. [1-8]

It is suggested in patients with dysfunctions of the liver, pancreas, and biliary tract which interfere with utilization of fats; in celiac disease and certain other diarrheal states. [1,4,8]

The Research Laboratories of U. S. Vitamin Corporation in 1943 pioneered and developed the making of aqueous solutions of lipo-soluble vitamins . . . now protected by U. S. Patent No. 2,417,299.

Samples available upon request.

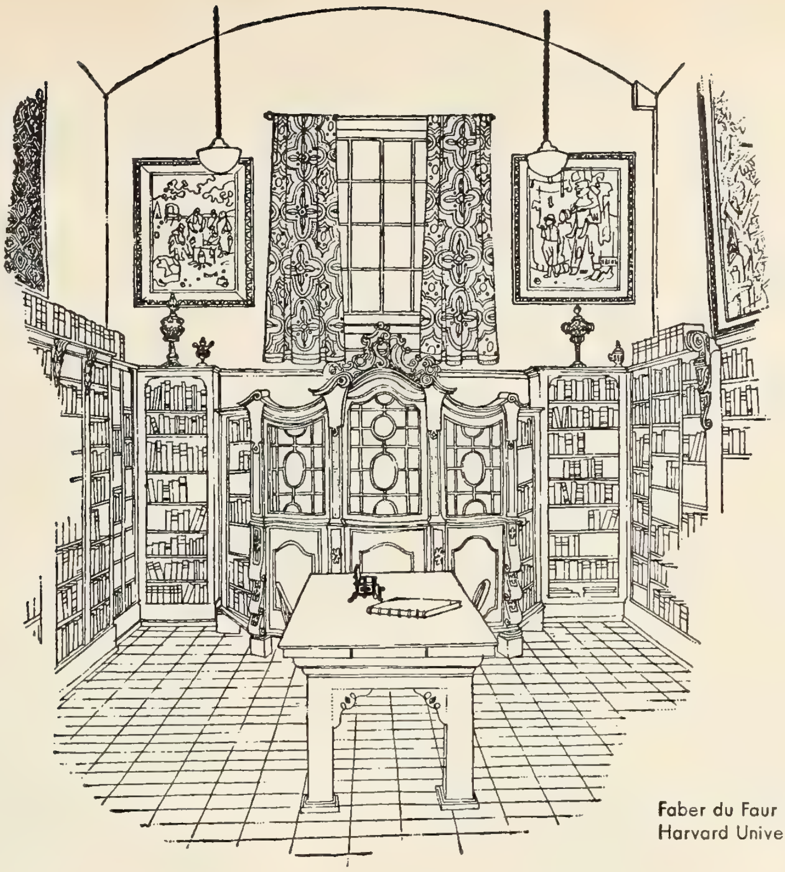
New aureomycin minimal dosage for adults —four 250 mg. capsules daily, with milk.



Faber du Faur Library, Harvard University

From among all antibiotics, Urologists often choose

AUREOMYCIN

Hydrochloride Crystalline

because Aureomycin concentration is much higher in the urine than in the blood, so that very satisfactory therapeutic urinary levels may be reached with moderate oral dosage.

Aureomycin appears in high concentration in the urine, and can be detected for as long as 55 hours after a single oral dose of 0.5 to 0.7 Gm.

Aureomycin serum levels are maintained for as long as 12 hours after oral administration, oral doses of 5 to 10 mg. per kilo at 6-hour intervals being adequate for this purpose.

Aureomycin has its activity greatly increased in an acid medium, rendering it highly useful in the normally acid urine.

Aureomycin has been reported to be useful in infections commonly seen by urologists, including:
Genitourinary infections caused by *E. coli*, *A. aerogenes*, *S. faecalis*, paracolon bacillus, staphylococcus, streptococcus, and enterococcus • Chronic or Resistant Urinary Infection* • Gonorrhea • Nonspecific Urethritis*

Throughout the world, as in the United States, aureomycin is recognized as a broad-spectrum antibiotic of established effectiveness.

Capsules: 50 mg.—Bottles of 25 and 100; 250 mg.—Bottles of 16 and 100. *Ophthalmic:* Vials of 25 mg. with dropper; solution prepared by adding 5 cc. of distilled water.

*When caused by aureomycin-susceptible organisms.

Chronic asthmatic

BACK SERVING WITH A SMILE

No need for the chronic asthmatic to give up work, play, a normal life. With Norisodrine Sulfate, a quick-acting bronchodilating powder, symptomatic relief is as near as the patient's pocket or purse.

When the asthmatic feels an attack coming on, he simply takes three or four inhalations of the powder, using the pocket-sized Aerohalor. Result? The bronchospasm usually ends quickly. No injections, no cumbersome equipment, no need to leave the job.

Norisodrine is effective against both mild and severe asthma.[1,2,3] It has relatively low toxicity, and with proper administration, side-effects are few and usually minor. Before prescribing Norisodrine, however, the physician should familiarize himself with administration, dosage and precautions. Literature may be obtained by writing Abbott Laboratories, North Chicago, Illinois. Abbott

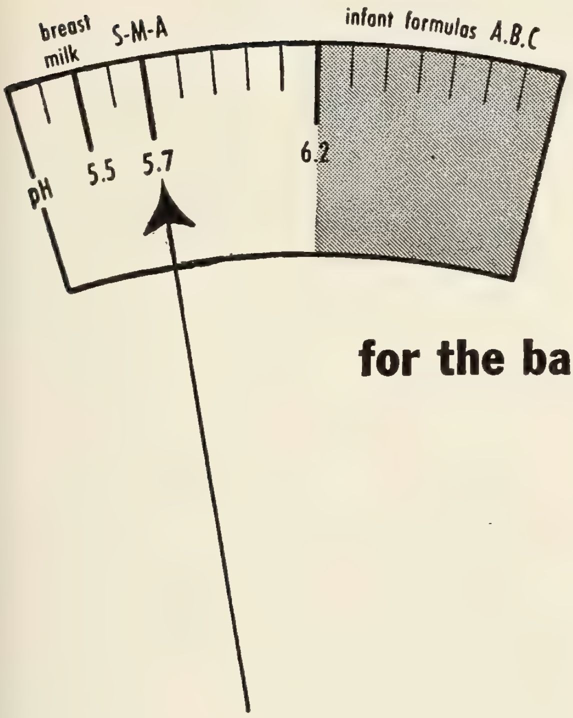
clinical tests prove S-M-A® is the only infant feeding formula that

- establishes a predominantly gram-positive flora—similar to the flora of the lower intestine of the breast-fed baby.[1]



- produces a stool with a pH "practically identical" with that of the infant fed human milk. Stools of babies fed other formulas are distinctly more alkaline (6.2 to 6.7).[1]

for the baby S-M-A means:

1 *Better absorption of minerals, especially calcium.*

2 *Lower incidence of constipation.* Formation of calcium soaps is inhibited; acid produced by fermentation stimulates peristalsis.

3 *Lessened susceptibility to diarrhea.* Lactobacilli inhibit overgrowth of 'colon' group bacilli.

4 *A stool typical of the breast-fed infant*—having a "buttermilk-like", rather than putrefactive odor.

5 *Vitamins more readily available, especially vitamin* B_{12}. Growth of putrefactive organisms which reduce amounts of vitamins available[2] is inhibited.

6 *Minimal danger of perianal dermatitis and diaper rash in the new-born.*[3]

Wyeth®

FIRST RESORT *in* NONSPECIFIC PROCTITIS *and* ULCERATIVE COLITIS

ACCEPTED
COUNCIL ON PHARMACY AND CHEMISTRY
AMERICAN MEDICAL ASSOCIATION

Negative results with certain other forms of therapy have prompted many physicians to turn to NISULFAZOLE as a "last resort"—only to discover that it should have been their first approach to NONSPECIFIC ULCERATIVE PROCTITIS and COLITIS.

NISULFAZOLE frequently brings striking initial improvement in these cases . . . reduction in number of stools often occurring within the first 24 hours. Administered intrarectally, NISULFAZOLE exerts "focal" action at the site of the disease. The high incidence of remission of symptoms following NISULFAZOLE therapy is a source of gratification to physician and patient alike.

ANTIBIOTIC DIVISION, CHAS. PFIZER & CO., INC., BROOKLYN 6, N. Y.

you couldn't prescribe it—

so we had to make it

Doctors have always wanted a formula for infant feeding that would be as close to human milk as nutritional science could provide.

The problem was immense; the requirements were rigid; the need was great. Borden took up the challenge, and after years of research and many trials and clinical tests the goal was accomplished. BREMIL was made available to the profession.

BREMIL is the first and, to date, the *only* infant food to achieve all of these prescription requirements:

. . . conforms to the fatty acid pattern of human milk
. . . conforms to the amino acid pattern of human milk
. . . has a calcium-phosphorus ratio (guaranteed minimum 1½:1) adjusted to the pattern of human milk to prevent tetany
. . . supplies the same carbohydrate as human milk – lactose
. . . is vitamin-adjusted for standards of infant nutrition
. . . offers a human milk size particle curd
. . . is well-tolerated, digested, assimilated

Clinical reference data and samples on request.
Now in drug stores in 1 lb. cans

Bremil® *powdered infant food*

Approximates the milk of the mother

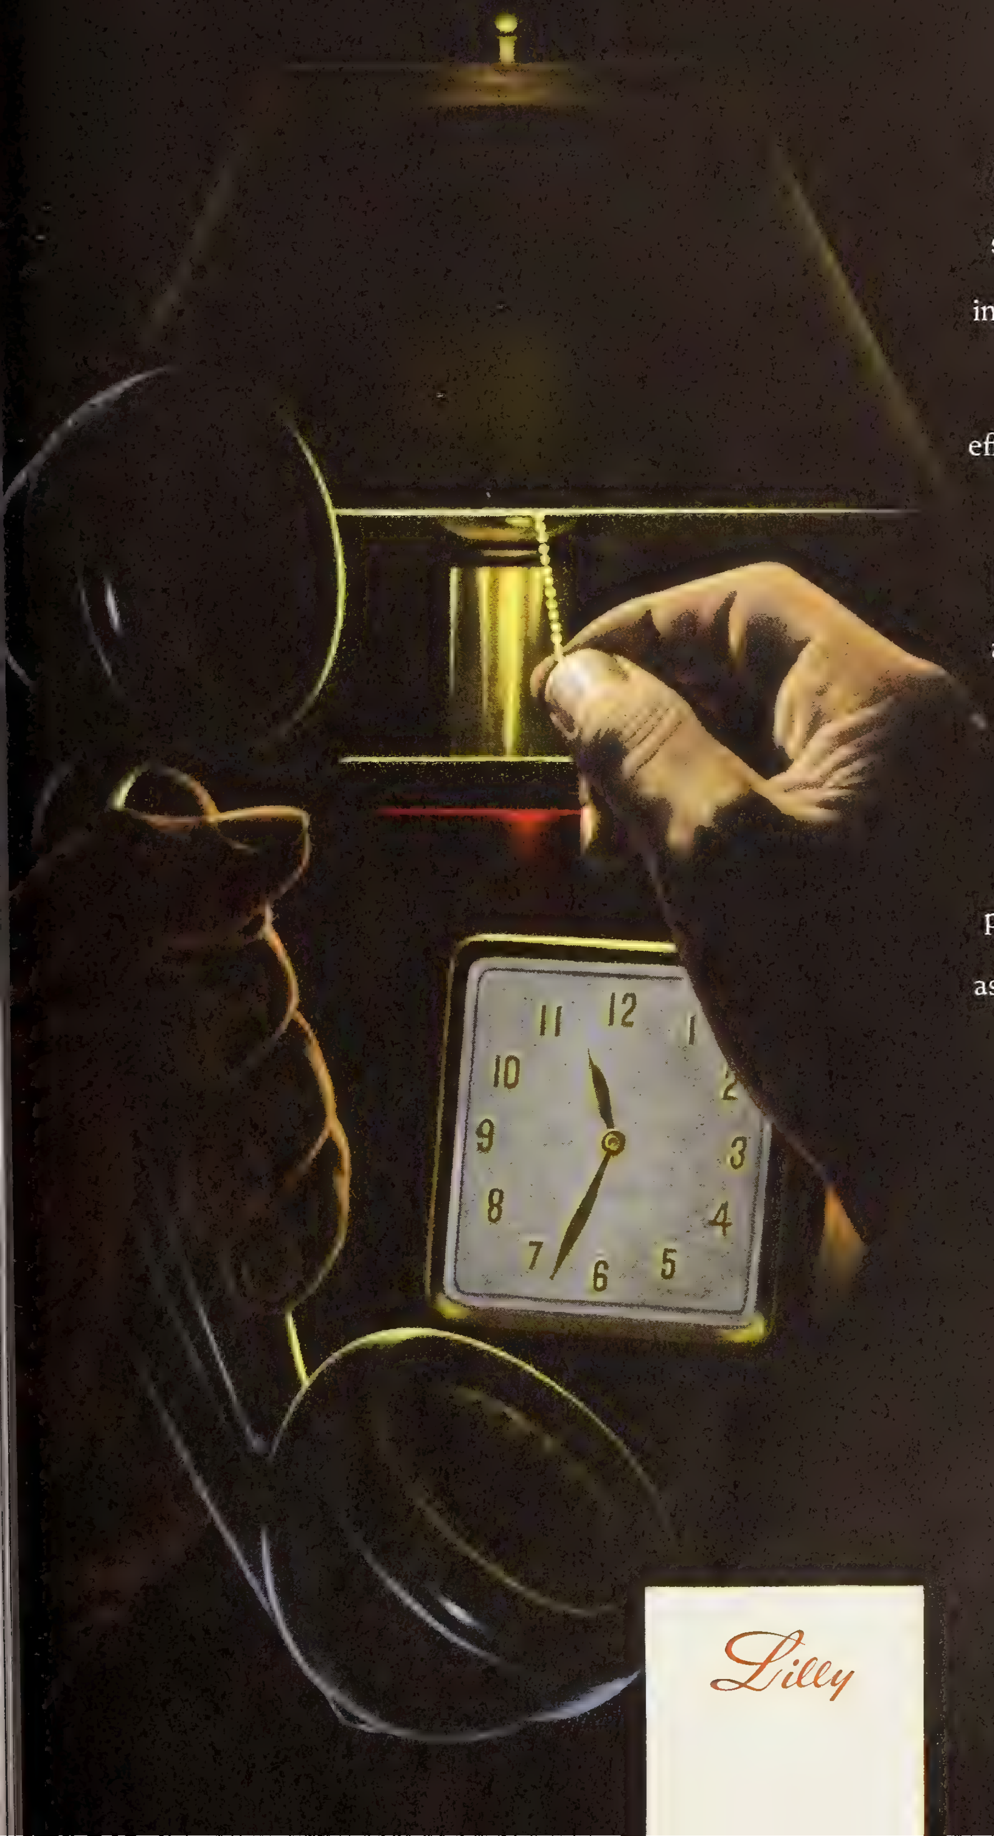
"Doctor Harris, what am I going to do?"



His patients sometimes forget that Dr. Harris also has to rest. Some of them seem to take it for granted that he is as inexhaustible as is his willingness to help. However, because of today's more effective medicines, his patients are getting well faster and night calls are fewer. Recently, therefore, Dr. Harris has been able to take an occasional much-needed rest and still treat more patients successfully than ever before. Furthermore, even long-established pharmaceuticals are gaining in usefulness as a result of such current research as . . . →

Lilly

. . . the development of an improved Insulin preparation . . .
NPH Iletin (Insulin, Lilly)

Hagedorn discovered that the antidiabetic effect of Insulin was lengthened by the addition of basic protein precipitants, such as protamines from fish sperm, globins, histones, and kyrins. Since that discovery, there has been a systematic study of many modifications which might simplify still further the management of diabetes.

In co-operation with the Insulin Committee of the University of Toronto, Eli Lilly and Company has actively participated in this search. Over several years, data were accumulated on the action of various modifications of Insulin in more than 5,000 cases. Because of knowledge gained from such studies, many of the difficult, time-consuming problems of diabetic management which once confronted physicians are now overcome by the use of NPH Iletin (Insulin, Lilly).

THE PRACTICAL ASPECTS OF THE Rh FACTOR

EDITH L. POTTER, M.D., Ph.D.
Chicago, Illinois

Rh and Hr are collective names for groups of antigens, some of which are attached to all human blood cells. There are several Rh subgroups (Rh′, Rh_o, Rh″ are the principal ones) and for each there is a reciprocal Hr group; if an individual lacks any Rh subgroup, he possesses the equivalent Hr subgroup instead. Rh and Hr subgroups are inherited by means of allelic genes. Since all genes are present in pairs, an individual may be homozygous or heterozygous for any of the Rh-Hr subgroups; for instance, his blood cells may exhibit the presence of only Rh′ and no Hr′; he is then homozygous for Rh′. If they show the presence of both, he is heterozygous; or if they show only the presence of Hr′, he is homozygous for Hr′. This is also true for all other subgroups.

In the Race-Fisher system of terminology C=Rh′, D=Rh_o, E=Rh″, c=Hr′, d=Hr_o, e=Hr″.

The Rh-Hr type of an individual is determined by testing his blood cells with serums derived from human individuals who have become immunized to specific Rh or Hr antigens. Antiserums for the three most common Rh subgroups—Rh′, Rh_o and Rh″—and for Hr′ and Hr″ are available from commercial sources. Serum to determine the presence of Hr_o is not available.

The two occasions when specific knowledge of subgroups is most valuable are (1) in cases of disputed paternity, and (2) in those instances where it is desirable to know whether the husband of an immunized woman is homozygous or heterozygous. In the former case knowledge of Rh-Hr subgroups adds considerably to the possibility of including or excluding the likelihood of parentage when information concerning genetic similarities or dissimilarities of the child and putative father is being considered.

In determining the status of the husband of an immunized woman, the Rh_o subgroup is the one about which information is usually desired. No anti-Hr_o serum is available for direct determination of homozygosity or heterozygosity and it is necessary to take recourse to the fact that a single Rh subgroup rarely exists by itself. Rh_o is usually inherited in combination with Rh′ or Rh″, or both, and consequently by testing for the homozygosity or heterozygosity of Rh′ or Rh″ it is possible to conclude that an individual is probably (although not positively) homozygous or heterozygous for Rh_o.

The subgroup Rh_o is the only member of the Rh-Hr complex that is commonly antigenic. In over 300 immunized mothers of erythroblastotic infants observed at the Chicago Lying-in Hospital in the past twelve years only two have been immunized to any of the other subgroups; these two were immunized to Hr′.

Rh_o was the variety of Rh first discovered, and it is the one to which reference is ordinarily made when a person is stated simply to be Rh-positive or Rh-negative. This is the way in which the term will be used in this paper. Since it is the only variety that has any appreciable clinical significance, it is adequate to test for this one subgroup in routine clinical practice.

Because it is possible for any Rh-negative in-

From the Department of Obstetrics and Gynecology, the University of Chicago and the Chicago Lying-in Hospital.

The data on which this paper was based were obtained in part from studies partly financed by the Douglas Smith Foundation for Medical Research of the University of Chicago.

The Arthur H. Sanford Lecture delivered at the annual meeting of the Minnesota State Medical Association, Minneapolis, Minnesota, May 27, 1952.

dividual to become immunized to Rh, no transfusion should ever be given without first determining the Rh status of the recipient; if the blood is found to be Rh-negative, he or she should be given only Rh-negative blood. It was learned after the last war that about half of the Rh-negative soldiers who had received transfusions had developed antibodies against Rh. If those who were immunized are transfused again with Rh-positive blood, they may be expected to develop severe and possibly fatal transfusion reactions.

It is even more serious to give Rh-positive blood to an Rh-negative female. This need not be in the form of transfusion, for as little as 5 cc. may induce the production of antibodies. Immunization established at any age is permanent, and blood given a small girl may prevent her bearing normal children many years later. Only in the most dire emergency, in the face of exsanguinating hemorrhage with no possibility of obtaining blood of appropriate Rh character, would it be forgivable to overlook the dire consequences that might ensue from giving Rh-positive blood to an Rh-negative individual. *Under no other circumstances should it be countenanced.* If a patient has had a previous transfusion or lost a baby, the possibility that immunization may exist must be considered and the need for blood weighed against the immediate danger.

Pregnancy also may constitute a means of establishing immunization, presumably by rupture of fetal vessels within villi with escape of fetal blood into the maternal circulation. Although about 50 per cent of all individuals become immunized by one or a few transfusions, only about 5 per cent of women become immunized by one or several pregnancies.

Ninety-five per cent of Rh-negative women have repeated pregnancies without becoming immunized. The specific reason why so many women escape is unknown although it is probably a combination of low reactivity on the part of the expectant mother and/or failure of fetal blood to excape into the maternal circulation.

If immunization is once established, all Rh-positive children subsequently conceived ordinarily suffer from erythroblastosis. A first-born child is rarely affected unless the mother has had a previous abortion or transfusion. Since there is no reason to believe that immunization may not be established as readily in a first pregnancy as any other, in order to explain the absence in a first pregnancy it must be assumed either that immunization does not reach a degree during a single pregnancy sufficient to affect the child or that antibodies are produced only at the termination of pregnancy. In either case it is evident that the child will ordinarily be affected only when antibodies are present early in pregnancy as a result of some previous assault. Consequently the earlier in pregnancy that examinations for antibodies can be made, the greater will be the significance of the findings; for that reason determinations should always be made on the first prenatal visit. If antibodies are absent on that occasion, the blood should be re-examined during the eighth month of pregnancy. If found then for the first time, the child will ordinarily be only very mildly affected. In a subsequent pregnancy the probability of more severe involvement is very great.

If antibodies are present in the first trimester of pregnancy, the child, if Rh-positive, is almost certain to be moderately or severely affected.

Antibodies of any variety and in any titer that are present early in pregnancy are significant and an affected child must be anticipated. Different methods of determining antibodies yield different titers, and even in the same laboratory tests made on the same blood by the same method may vary on different occasions. Consequently it is impossible to make definite statements concerning the prognostic value of any given antibody titer, but in general a range of 1:1 to 1:10 is associated with a considerably better outlook for the infant than one appreciably higher. However, we have seen fatal cases of erythroblastosis in women whose antibody titer remained from around 1:1 to 1:4 throughout pregnancy.

In our experience the level of antibodies during the first trimester is of much more significance than any change of titer that may occur later and it is on this that greatest weight is placed in giving a prognosis.

Although some investigators have reported that a rise of titer never occurs during a pregnancy in which the child is Rh-negative, this has not been true in our experience. Rising titers have occurred in several women carrying Rh-negative fetuses, and a titer of 1:5,120, which is as high as we have ever obtained by our methods, was present at the end of pregnancy in one patient with an Rh-negative infant.

Antibody titers usually increase for the first two to three weeks after the termination of pregnancy; they may remain indefinitely at a high level or they may gradually diminish. Antibodies rarely disappear, but if they do, they almost invariably reappear early in a subsequent pregnancy.

At present there is no method of abolishing the immune state when it has once been established. All means so far suggested have proved to be of no value. It is too soon to know for certain the effect of ACTH and cortisone although preliminary investigations do not seem hopeful. In order to attempt to prevent initiation of immunization, labor and delivery in all Rh-negative women should be conducted in such a way that every attempt is made to avoid the possibility of fetal blood entering the maternal circulation. Manual removal of the placenta is always accompanied by rupture of fetal vessels and fetal blood almost certainly enters the maternal circulation. Mechanical interruption of early pregnancy should be recognized as a common cause of immunization.

Abortions do not occur because of Rh immunization, but abortions, especially those induced or terminated by mechanical means, permit entrance of fetal cells into the maternal blood stream and may be the cause of immunization.

Pregnancy should rarely if ever be terminated prematurely because of maternal immunization, in the belief that to shorten the period during which the fetus is being subjected to the action of antibodies lessens the severity of the disease. In our clinic we have been opposed to early termination for many years because we have seen no good, and much harm, come from it. Diamond, who was once in favor of the procedure, now speaks vehemently against it, stating that of surviving infants showing clinical evidence of kernicterus, all have been premature.

When antibodies are present in the maternal blood and there is a possibility of an erythroblastotic child being delivered, the baby should be immediately examined after birth. If it is Rh-positive and the hemoglobin of the cord blood is less than 14 gm., it is our practice to do an immediate replacement transfusion. If antibodies are known to be present in the maternal blood, a Coomb's test gives no additional information of value. If for any reason the state of the mother's blood is unknown, a positive Coomb's test on cord blood will prove that antibodies derived from the maternal circulation are attached to the fetal blood cells. Maternal immunization to a blood factor (usually Rh_o) which is similar to one possessed by the fetus, plus anemia of the infant, are the two requisites for a diagnosis of erythroblastosis.

Treatment of choice of an affected child is immediate exchange transfusion, using 500 cc. of Rh-negative whole blood, followed by repetition of the exchange as many as three or four times in the presence of deepening jaundice, rising bilirubin levels or any other untoward symptoms. With such a method, Diamond reported treating over 200 infants without a fatality or case of kernicterus. Although exchange transfusions seem to give far better results than any other form of treatment, they are not without hazard to the infant in unskilled hands, and every attempt should be made to have immunized patients delivered as far as possible in hospitals where an experienced transfusion team is available.

Infants with erythroblastosis often go through a non-regenerative phase of blood formation for varying lengths of time after birth. It may be necessary to give small additional amounts of blood at four to six weeks of age during the period when the cells given by exchange transfusion are being destroyed. The further course of these infants is usually uneventful.

The incidence of kernicterus—permanent brain damage—varies according to treatment and to the severity of the disease. It is related to persistant high bilirubin levels manifested by deep prolonged jaundice. In the absence of severe jaundice it practically never occurs. The repetition of the exchange transfusions is primarily for the purpose of preventing postnatal blood destruction and hyperbilirubinemia.

A hemorrhagic tendency often accompanies severe erythroblastosis. For this reason vitamin K is given at birth and repeated every twenty-four hours for several days. Except for iron and vitamin K, no medication has been shown of value.

In general, Rh-negative women who have once lost a child from erythroblastosis should be advised against future pregnancies because of the great likelihood of repetition of the outcome. However, therapeutic abortion because of Rh-immunization is not justified. It is impossible to be certain of the outcome of any pregnancy, and even after several deaths or stillbirths there is still

(Continued on Page 773)

EMERGENCIES OCCURRING DURING ANESTHESIA—THEIR TREATMENT AND PREVENTION

FERDINAND C. JACOBSON, M.D.
Duluth, Minnesota

AN EMERGENCY may be defined as an unexpected serious happening demanding immediate action. Almost every emergency occurs when it is unexpected. A normal physiologic response may become an emergency if there is lack of understanding of the factors involved. This fact suggests the means of prevention. Anticipation of difficulties will prevent most emergencies. Only continued advances in knowledge and a frank recognition of the hazards of faulty administration will reduce the incidence of fatalities and morbidity. The American Society of Anesthesiologists has fostered the development of Study Commissions in the various component societies for the express purpose of analyzing emergencies which occur during anesthesia. By frank discussion of the management much valuable criticism has been made available.

Some Physiologic Considerations

The unexpected serious happenings which demand immediate action produce fundamental physiologic changes, the most important being anoxia, hypercapnia, and hyperthermia. Physiologists have shown that there are four types of anoxia.

1. Anoxic anoxia, or lack of oxygen in the tissues produced by interference with the oxygenation of the pulmonary blood.

2. Stagnant anoxia or lack of oxygen in the tissues produced by faulty transport of oxygen carrying blood.

3. Anemic anoxia, or lack of oxygen in the tissues produced by faulty carrying power of the blood, and,

4. Histotoxic anoxia or lack of available oxygen in the tissues produced by the inability of the cell to utilize the oxygen brought to it by the blood.

Hypercapnia or the increased carbon dioxide content of the blood may be caused by increased production or deficient elimination of carbon dioxide.

Likewise hyperthermia or abnormally high temperature of the body may be caused by increased heat production or deficient heat elimination.

Emergencies which produce one or more of these three alterations of cellular physiology are always serious and may be fatal.

Some Common Emergencies During Anesthesia

1. Obstruction of the natural airway by soft tissues such as the relaxed tongue or by anatomical alteration during neck operations is a source of danger which is frequently unexpected. Endotracheal anesthesia has done much to eliminate this emergency. There is no substitute for an adequate knowledge of the upper airway and its proper application in providing a patent one. The anatomical relationships are different in the awake and in the anesthetized state. The anatomy of the glottic opening and its relation to other structures is still a mystery for many due to the lack of emphasis of this subject in our medical education. In tonsillectomy, some doctors do not seem equally interested in providing a patent airway while removing the tonsils. Unless the glottis and base of the tongue are lifted forward and away from the posterior pharyngeal wall, aspiration of blood and tissue will be almost unavoidable. Both soft tissue obstruction and aspiration of blood may cause fatal anoxia.

2. Vomiting during induction of anesthesia with aspiration of vomitus may readily occur especially when the stomach contains partially digested food and may produce a crisis which should always be borne in mind. Obstetrical patients and patients with bowel obstruction are frequently in peril from this cause. Treatment begins with prophylaxis. Eating should be curtailed in all obstetrical patients who are in labor. All patients with bowel obstruction, and this especially includes babies for whom a Ramstedt operation is planned, should have a stomach tube in place and an empty stomach before anesthetic agents are administered. Aspiration of vomitus

---

Read in the Symposium on Emergencies at the annual meeting of the Minnesota State Medical Association, Minneapolis, Minnesota, May 26, 1952.

may be fatal. In very ill and weak patients with bowel obstruction, regurgitation of stomach contents with fatal or near fatal anoxic anoxia is an emergency familiar to all. Besides gastric decompression preoperatively, Fowler's position during induction, instantly available suction, and endotracheal intubation are indicated. When aspiration of vomitus has occurred, immediate endotracheal or endobroncheal aspiration is indicated, either by bronchoscopic aspiration while the patient is asleep, or by endotracheal intubation, especially in the patients whose cough reflex is ineffective. Delay in aspiration usually gains nothing. Atelectasis, pneumonitis and in some a fatal outcome from anoxia immediately or in the early postoperative period may result. It should be pointed out that the immediate relief of bronchial occlusion usually prevents atelectasis from developing from the absorption of the respiratory atmosphere. A delay of 30 minutes may allow irreversible atelectasis to develop.

3. Apnea from relative or absolute overdose of depressant is a most critical and demanding situation. Anoxic anoxia may develop in a matter of seconds if the respiratory functional capacity is limited. Whenever active respiration is deficient or absent, passive respiration should be instituted. Almost invariably, unless anoxia, hypercapnia or hyperthermia has wrecked the respiratory reflexes, passive respiration, until the drugs have been eliminated, will suffice. Stimulating drugs have little place. Supplying the basic physiologic requirements will maintain a viable state better than a variety of stimulating drugs. The simple plain common-sense practice of medicine will prove very adequate. When the cause of apnea is known to be reversible, one need not become alarmed. If anoxic damage is present then there is genuine cause for alarm.

4. Four factors may produce stagnant anoxia, namely, failure of cardiac output, reduction in blood volume, collapse of peripheral resistance, and decrease of viscosity.

(a.) Failure of cardiac output may result from cardiac arrhythmias, inadequate venous blood return, or failure of the respiratory support of circulation. Prevention is again the best cure. Preoperative digitalis or quinidine and oxygen for the cardiac irregularities has aided in the management of this type of cardiac disturbance. During the course of anesthesia cardiac arrythmias may occur. Intravenous procaine is of value when the usual measures and oxygen have failed to restore a satisfactory cardiac status. Splinting the extremities by wrapping with elastic bandages and the Trendelenburg position may be used to help venous return. Maintenance of normal pressures within the thoracic and abdominal cavities will do much to retain the respiratory support of circulation during operations.

(b) Reduction of blood volume should be insured against by the replacement of blood loss before the compensatory power of the circulatory system has been overtaxed. In cases where the need for blood may be acute and venipuncture hard to accomplish when hypotension exists, the prophylactic intravenous route should be established before the hypotension from blood loss occurs. In infants especially the cutdown and insertion of a polyethylene tube may be life saving.

(c) Peripheral resistance must be maintained by the use of the vasopressor drugs, the tourniquet, or by elastic bandage splinting of the extremities. Spinal anesthesia in cases where decreased peripheral resistance would be harmful or fatal should always be preceded by the establishment of the prophylactic intravenous avenue for the injection of vasopressor drugs. This especially includes cesarean sections where hypotension and anoxia may prove fatal to the mother and child, and in operations on patients having heart disease, particularly in those having coronary insufficiency.

(d) Decreased viscosity may contribute to alarming hypotension and anoxia. The use of concentrated serum albumin has proved of value.

5. Anemia is a potent cause of anoxia—sudden hemorrhage is frequently a major factor in its production. This type of emergency demands blood replacement and often with speed. In the presence of a failing heart, intra-arterial transfusion is a method of treatment but it is to be employed with caution and used only after the other methods have failed.

6. Perhaps the most dramatic emergency occurring during anesthesia is the convulsion. From a list of possible etiologic factors only four are constantly incriminated; anoxia, hypercapnea, hyperthermia, and strong irritant anesthetic agent. The convulsion usually occurs in very ill patients, especially children, with fever, acidosis, and severe toxic states. The hypercapnia and hyperthermia are caused by both excess production and decreased elimination. Deficient transport by the circulatory system and interference with the

elimination by the respiratory system are factors in heat and carbon dioxide retention. It should be noted that respiratory obstruction or depression by deep anesthesia may strongly contribute. This emergency is highly fatal if untreated and demands instant therapy. The factors producing the convulsion should be reversed without delay. Immediate removal of the offending anesthetic agent, increasing the elimination of heat from the body, restoration of the acid-base balance toward normal with Buffer solution and termination of the convulsive movements with dilute pentothal cautiously given, is demanded. *Do not temporize.*

Principles of Prevention of Emergencies

In the management of emergencies during anesthesia, preventive policies are of much more value than therapeutic measures. There are many principles, not all of them pertaining to the practice of medicine, that are worth mentioning.

1. Emergencies may occur at any time but they occur most frequently during induction of anesthesia and recovery and particularly during rapid inductions. Concern should be given to their prevention and treatment especially in the very young and old, seriously ill and debilitated patients.

2. Consultation with the surgeon, internist, or other member of the surgical team does much to alert the anesthesiologist to the possible emergency conditions which may arise. Consultation is definitely worthwhile. The surgeon sometimes forgets that his behavior is a source of inspiration to the whole operating team. Irrational, impulsive, or behavior dominated by an unbridled temper does not generate intelligent response to the demands of an emergency.

3. Haste, poorly co-ordinated planning, emotional display, and a compromising attitude have no place in the operating room and prevent the establishment of a sound program for the prevention of emergencies. Nervous tension is a most unnecessary biproduct and usually leads to damaging confusion. The calm and collected attitude of the experienced surgical team is essential to a rational appraisal of any emergency. A free exchange of constructive thought should be continually sought, religiously fostered, and zealously guarded.

4. A constructive educational program shared by all members of the operating team is essential. The high ideals of The Master must dominate our thinking, not the expediency of the present day rush. No drugs should be administered by inadequately trained personnel. Emergencies occur more frequently where a knowledge of physiology and pharmacology of anesthetic drugs is dimly understood. The practice of anesthesiology becomes loaded with possible emergencies wherever the ordinary probabilities remain unexpected. The more the complications are anticipated and prepared for the fewer emergencies will occur.

Our Professional Obligation

Almost all discovery and research in anesthesiology has been done by doctors and we can all take just pride in the contributions of our colleagues in this field of medicine. Future progress and the assimilation of anesthetic facts depend on the wholehearted support of all practicing doctors. What you do to maintain the dignity of the practice of anesthesiology will be reflected in decreasing emergencies, fatalities, and morbidity. What you do to develop the practice as one which will attract new recruits will do much to alleviate the shortage of anesthetists, both physicians and nurses. Probably the shortage of anesthetists in the small hospitals will persist until more physicians are trained to do the work and to train others. It is our obligation to advise hospitals about necessary equipment and to see that it is maintained in proper working condition. That anesthetic drugs will continue to be administered can be taken for granted. Only through increased knowledge and intelligent co-operation and application can the emergencies be prevented and corrective treatment instituted. *Most anesthetic emergencies are preventable.*

PARTICIPATION IN PUBLIC HEALTH PROGRAMS

Public health programs should be so organized that the people who have the problems are given an opportunity to plan and contribute to the solution. Too often there is little participation by the individual, who passively receives the services. In a sense, health officials should aim to make every citizen a public health worker, at least in his own behalf.—Joseph W. Mountin, M.D., *Public Health Reports,* April, 1952.

EMERGENCIES OCCURRING DURING SURGICAL PROCEDURES

DAVID P. ANDERSON, M.D.
Austin, Minnesota

AN EMERGENCY is defined as "a sudden condition calling for immediate action." When this definition is applied to emergencies occurring during surgical procedures, certain generalities may be drawn:

1. The surgeon and his associates must be capable of rendering whatever immediate action is necessary to restore the situation to normal and prevent a catastrophe. The operating team must be *prepared, trained and equipped* to cope with any emergency that may arise.

2. Although emergencies may appear with alarming suddenness, they may be anticipated and avoided. The poor surgeon operates in an almost constant state of emergency. The skilled surgeon makes the difficult look easy, primarily by avoiding trouble.

Hemorrhage

Hemorrhage is the commonest emergency encountered during operations. Its control is a routine part of any surgical operation and is familiar to all of us. However, there are a few points in regard to the prevention and management of hemorrhage that deserve our consideration. No apology need be made for the reemphasis of these details, for it is only by conscious effort that faulty habits are corrected, and the practice of sound surgery becomes second-nature with us.

We will list, without detailed comment, certain basic principles that we feel are particularly important in the prevention and management of hemorrhage during operations:

1. There is no substitute for *adequate anatomical exposure* in the prevention of hemorrhage. When major vessels are to be divided they should be clearly demonstrated, ligated or clamped, and then divided under direct vision.

2. Division of a vessel between *previously placed ligatures* is preferable in many situations.

3. One should select and become accustomed to the use of the finest possible ligatures. Bulky, heavy ligatures cannot be firmly seated about a vessel, and they tend to slip easily. Size 000 catgut is satisfactory for routine use; 0000 and 00000 catgut is nice for more delicate procedures. It is occasionally necessary to use 00 catgut for heavier ligatures. In general, somewhat smaller sizes may be used if one prefers silk or cotton.

4. It is wise to use a *pneumatic pressure cuff* to obtain a dry field during operations on the extremities. There are very few contraindications to the use of a pneumatic pressure cuff. *Do not use a tourniquet:* it is a dangerous weapon and should be kept only as a museum-piece.

5. When division of an artery is incomplete, the vessel must not be ligated in continuity. The injured segment must be divided or excised to prevent reflex vasospasm and secondary erosion.

6. Ligation of a large artery, particularly one to an extremity, should be accompanied by simultaneous ligation of its companion vein. There is one exception to this rule: if the distal stump of the artery continues to pulsate after division, it may be assumed that collateral circulation is already adequate and ligation of the companion vein is then unnecessary.

7. It should not be forgotten that *suture-ligatures* are invaluable in certain tissues for the control of hemorrhage.

8. *The immediate temporary control of excessive bleeding can be accomplished by firm pressure* with gauze pads. *Avoid repetitions and blind groping with a hemostat in a puddle of blood;* there is no surer way of producing irreparable damage to vital structures.

Firm pressure with gauze pads and ten minutes of patience will permanently control much troublesome bleeding. The same procedure will make the control of even the most serious hemorrhage an easier, deliberate, and planned maneuver. Watson-Jones tells the story of a surgeon who purposely cut the vessels in the renal pedicle, without applying clamps or ligatures, in order to demonstrate the ease of controlling hemorrhage.

Read in the Symposium on Emergencies presented at the annual meeting of the Minnesota State Medical Association, Minneapolis, Minnesota, May 26, 1952.

The surgeon calmly packed the wound tightly with large gauze packs, and left the operating room for a cup of tea. On gently removing the packs five minutes later, the field remained dry long enough for him to apply hemostats with great deliberation to both the artery and the vein.

9. Remember that successful *end-to-end anastomosis* of even relatively small arteries can be accomplished with the use of heparin to prevent thrombosis. If disastrous ischemia may result from arterial ligation, anastomosis should be done, if possible.

10. Avail yourself of equipment that will make hemostasis during surgery easier: a good suction, with a fine tip, such as the neurosurgeons use routinely; silver clips; an electrocoagulation unit, and oxidized gauze of various sizes. All of these are useful at times.

Shock

Shock, like hemorrhage, is a common emergency during operations. Fortunately, the modern surgeon does not have to operate in constant fear of surgical shock as the relative ease of volume-for-volume replacement of blood loss alleviates such fear. The problem does arise, however, and occasionally constitutes an extreme emergency.

The first consideration in the management of shock during operations is the proper evaluation of the patient preoperatively. Volume-for-volume replacement of blood loss must be planned when extensive elective operations are contemplated. Existing shock must be controlled *before the operation* in the case of seriously injured patients or in the presence of acute massive hemorrhage. It may not be possible to restore the severely shocked or exsanguinated patient to an ideal circulatory state, nor is it wise to delay unduly in the attempt, but shock should be controlled preoperatively to the point where tissue anoxia is relieved. This means a systolic blood pressure of 80 mm. of mercury or above. In addition, plans must be made for the continued vigorous treatment of the patient during the operation. A minimal systolic blood pressure of 100 mm. of mercury is sought. When there has been blood loss, whole blood is used to replace the estimated loss, whether it be 500 or 3500 cc. When there is continued shock without exceptional blood loss, serum albumin infusion is an excellent supplement, and is preferred to the excessive use of whole blood.

Intra-arterial transfusion is occasionally indicated as a resuscitative measure in profound shock. Every operating team should be familiar with its use and the necessary components of a simple pressure system for arterial transfusion should be available in every hospital. Caution must be exercised to avoid the introduction of air into the patient, as this constitutes one of the great hazards of the procedure. Care must also be taken to prevent ischemic necrosis due to arterial spasm. This complication may be avoided by the local infiltration of procaine and by the application of a pressure cuff distal to the site of arterial puncture.

Cardiac Arrest

One of the most awe-inspiring emergencies which arise during surgical operations is cardiac arrest. Fortunately, it is not a common complication. When it does occur it requires prompt decisions and immediate radical treatment: Three and one-half minutes is the limit of time available to restore heart action if irreparable brain damage is to be avoided.

The anesthetist and the surgical team must be alert to the possibility of this emergency, which may occur with any operation or at any time during the induction and maintenance of anesthesia. The team must be organized to institute restorative measures promptly, without the confusion and hesitancy which ordinarily accompanies such a catastrophe.

It is the anesthetist's duty to inform the surgeon of the need for immediate action when cardiac arrest is detected or suspected, and to start artificial respiration with 100 per cent oxygen, preferably through an endotracheal tube. It is the surgeon's duty to start cardiac massage at once. This may be done through an opening in the diaphragm, if an abdominal operation is in progress, or, better still, through an incision in the fourth interspace on the left. We keep a few sterile instruments readily available in the operating room and specifically designated for use in making an intercostal approach to the heart should cardiac arrest occur when the necessary instruments are not otherwise available. Simultaneously with the instigation of artificial respiration and cardiac massage, 0.5 cc. of 1-1000 adrenalin is given intravenously. This may be combined with 9.5 cc. of 1 per cent procaine and kept ready and mixed for immediate use, as Lahey recommends.

Laryngeal Obstruction

Laryngeal obstruction due to laryngospasm and inspiration of foreign material is a frequent anesthetic complication that may require the cooperation of the entire surgical team. Complete laryngeal obstruction due to laryngeal edema or trauma is less common. When it does occur it is a potentially serious complication, but it can be handled easily if the operating team is properly prepared. Endotracheal intubation or the introduction of a bronchoscope will afford an immediate airway and temporary control of the situation. Tracheotomy can then be done in an orderly fashion. The necessary equipment for these procedures should be readily available in every operating room. A surgeon who does not have an anesthetist capable of doing endotracheal intubations should master the technic himself—it is not difficult.

Air Embolism

Air embolism is an emergency of surgery of the neck, axilla and mediastinum. It occurs when air is sucked into the collapsed veins as they are cut or torn. The introduction of a fatal amount of air into the circulation may occur quickly in this manner. Non-fatal air embolism may cause convulsions, shock, and cardio-respiratory difficulties.

The surgeon usually becomes conscious of air embolism by hearing the noise produced by suction of air into the veins. Compression of the operative area with moist sponges immediately controls the situation. Flooding of the field with normal saline solution is also recommended as a means of control. If the torn vessel cannot be easily located, and ligated or sutured, the wound should be lightly packed.

Injury to Vital Structures

Accidental operative injury to vital or important structures is not an uncommon emergency during surgery. These injuries occur and are to be occasionally expected in spite of the fact that operative techniques are deliberately planned in order to avoid them.

Adequate anatomical exposure is the best guarantee against damage to vital structures. If one wishes to avoid injury to the common bile duct, for example, the duct must be clearly exposed, together with the adjacent right hepatic and cystic arteries. The anesthetic must be good and the incision adequate. The surgeon must know the anatomy of the region, and *know that he knows it.* The surgeon who plans an operation that he does not do too often must be humble enough to refresh his knowledge of the regional anatomy and the potential hazards prior to the operation. His home library should include good reference books for this purpose.

When operative injury of vital structures does occur the emergency must be recognized and treated. The immediate repair of a severed common bile duct, together with the insertion of a T-tube through a separate opening in the duct, will be followed by few, if any, ill-effects. Other operative injuries may likewise be repaired at the time of the injury without undue difficulty. When such injuries are overlooked, however, the late repair may be extremely difficult and hazardous, if indeed the patient survives until an attempt can be made to correct the damage. It cannot be too strongly emphasized that injuries of vital structures must be recognized *when they* occur, and repaired *where they occur.*

CHEST X-RAYS

Ten years ago, a chest x-ray for the apparently well person was relatively uncommon. In 1950, however, some 15 million people in the United States had small-film radiographic examinations of their chests in tuberculosis screening programs. Since the development of the photofluorograph in the late 1930's, and its refinements in the 1940's, the use of miniature x-ray equipment by local official and voluntary health agencies has grown enormously, and there is scarcely a state or county of the United States where case finding by this means has not been done, either in community-wide surveys or in segmental surveys of special population groups.—Robert J. Anderson, M.D., Medical Papers of the Annual Meeting of the Canadian Tuberculosis Association, May, 1951.

IMMEDIATE POSTOPERATIVE EMERGENCIES

JOE W. BAIRD, M.D.
Minneapolis, Minnesota

IMMEDIATE postoperative emergencies are frequently of such severity as to cause grave concern for the life of the patient. Unless these complications are adequately treated, death may ensue. Surgical shock and failure of the cardiac or respiratory systems are the usual causes of the immediate postoperative emergencies.

Surgical shock, which has developed during the course of the operation, whether it be from loss of blood, undue surgical trauma or general debility of patient, must be adequately treated during the surgical period. Treatment must be continued postoperatively if the life of the patient is to be preserved.

Hypotension is perhaps the most common cardiac emergency. During the course of the anesthetic, the respiratory exchange of the patient may become depressed. This depression causes the carbon dioxide in the tissues to be inadequately eliminated, with the result that the blood pressure is elevated or maintained at what may be considered a normal level. The patient, upon emerging from the anesthetic, is permitted to breathe room air. Thus the excess carbon dioxide which has accumulated is eliminated, with the result, that the blood pressure frequently falls to a level which is at times alarming. This complication should be treated by placing the patient in a mild Trendelenburg position and by administration of vasoconstrictors and blood or other intravenous fluids. This treatment will usually return the blood pressure to a normal level. However, several hours may elapse before the pressure is fully stabilized.

Cardiac failure, with or without pulmonary edema, may be encountered. An electrocardiogram is of value in determining the type of cardiac involvement thus indicating the proper treatment. Pulmonary edema, should it develop, is treated by administering oxygen under increased pressure. Proper cardiac medication and oxygen administered with 3 to 5 mm. pressure is the treatment of choice for this emergency. It may be necessary to continue the administration of positive pressure oxygen for several hours or until the edema is adequately controlled.

Cardiac arrest, with or without ventricular fibrillation, calls for immediate and heroic treatment. The left chest should be immediately incised and cardiac massage started at once. Massage should be adequate to maintain a systolic blood pressure of at least 80 mm. of mercury. Intracardiac epinephrin, 0.5 cc. of 1/1000 solution in 10 cc. of 1 per cent procaine, will frequently establish a normal rate and rhythm. If ventricular fibrillation is present, electrical defibrillation may be necessary to establish a normal rhythm. Adequate oxygenation must be maintained during this period of cardiac arrest. The oxygenation must be maintained by artificial means through an endotracheal tube. This will insure an adequate, unobstructed airway.

Atelectasis is one of the most common postoperative complications. One or both lungs may be partially or totally involved and the amount of lung tissue involved determines the severity of this emergency. If one or more lobes are collapsed, the patient may have varying degrees of cyanosis, diminished breath sounds and dullness to percussion over the atelectatic area. These patients should be x-rayed to determine the amount of lung pathology. If the involvement is not excessive and oxygenation is adequate, vigorous pounding over the area will often loosen the obstructing "plug" and allow normal aeration of the lung to be established. The atelectatic patient should be placed in a high oxygen atmosphere to insure proper oxygenation. If cyanosis is present, after the patient has been placed in an oxygen tent, he should be bronchoscoped to remove the obstructing material and allow the lung to aerate properly.

Aspiration of vomitus or other foreign material may present a dire emergency. The offending material must be removed from the bronchotracheal tree as soon as possible. Proper positioning to promote drainage and bronchoscopy is indicated.

Tension pneumothorax and hemothorax following thoracic surgery may develop. These complications must be treated immediately by as-

---

Read in the Symposium on Emergencies presented at the annual meeting of the Minnesota State Medical Association, Minneapolis, Minnesota, May 26, 1952.

pirating the air or blood from the thoracic cavity, thereby allowing the lung to expand properly. The hemorrhage should be stopped by surgical means, if signs of excessive bleeding are present.

Immediate postoperative hemorrhages, other than thoracic hemorrhage, may occur, producing signs of surgical shock. This hemorrhage must be controlled as soon as possible. In the meantime, the patient should be supported by transfusions of whole blood. Diagnostic measures, such as hemoglobin and hematocrit determination, are of little value because at least twenty-four hours should elapse before these readings become accurate enough to indicate blood volume. In the meantime, physical signs must be relied upon in determining the amount of blood loss and the necessity of further transfusions.

Pulmonary emboli may occur in the immediate postoperative period. Usually the treatment of these emboli is of no avail. However, cervical sympathetic blocks may be of value if done immediately.

Coronary involvement may be another postoperative complication. Frequently, the coronary attack is initiated by hypotension which the patient may have developed. Adequate blood pressure must be maintained, at all times, to lessen this complication.

Laryngeal edema may develop postoperatively. This is especially true of children who have been subjected to endotracheal catheterization with too large an endotracheal tube. These patients should be placed in an oxygen tent to insure adequate oxygenation. A high, cold humidity should be maintained in the tent. If this treatment does not correct the laryngeal edema enough to allow adequate oxygenation, immediate tracheotomy should be performed to lessen the dangers of hypoxia.

The stomachs of small children may be overdistended by the anesthetic gases to such a degree that the respiratory exchange may become embarrassed. Removal of the gas, with a stomach tube, will eliminate this respiratory embarrassment.

Hemiplegia may develop during the immediate postoperative period. This complication may be due to cerebral hemorrhage, emboli or spasm in the cerebral vessels. Cervical sympathetic block will produce a dilatation of these vessels and at times relieve this complication. If actual hemorrhage is the cause of hemiplegia, cervical blocks are contraindicated.

Anoxia, of such a degree as to cause brain damage, may have developed during the operative period. Postoperatively, these patients do not recover satisfactorily because of the brain damage. Cerebral edema, with a resulting "wet brain," follows prolonged hypoxia. This edema should be treated by the administration of concentrated human serum albumin, 100 cc. intravenously, every four to six hours. Bilateral cervical sympathetic block produces dilatation of the cerebral vessels. This dilatation results in an increased blood flow through the brain and a lessening of the edema.

All immediate postoperative emergencies require adequate and skillful treatment. They are best treated in a well-equipped and well-staffed recovery room. Here the patients can be adequately observed and supervised until they have regained consciousness and the cardiac and respiratory functions have stabilized to such a degree that they may be safely returned to their rooms.

CHEMOTHERAPY IN TUBERCULOSIS

In general, patients with minimal pulmonary tuberculosis should not undergo chemotherapy, because most of them derive as much benefit from ordinary methods of treatment. In any event, the importance of correlating chemotherapy with other methods of treatment cannot be stressed too greatly. Chemotherapy is not a substitute for prolonged bed rest, and the proper timing of the addition of collapse therapy, when appropriate, should be planned in each case on an individual basis, at the outset. —William S. Schwartz, M.D., The J.A.M.A., February 23, 1952.

THE EVALUATION OF COMPENSABLE DISABILITY

CARL O. RICE, M.D.
Minneapolis, Minnesota

THE evaluation of industrial disability has seemed always to create a great deal of controversy between doctors. Those men who have learned how to evaluate disabilities usually arrive at the same conclusion, though their method of doing so may vary.

In this locality certain men, such as Harvey Nelson, Ed Evans, M. O. Henry and the late George Dunn, have learned infallibly to make accurate evaluations of disability.

It will often be heard said by the inexperienced that a piano player should receive greater disability for the loss of a finger than a laboring man, or that the loss of a foot is worth more to a dancer than it is to an office worker. These opinions, no doubt, may be correct, but it is not the responsibility of a doctor to determine the monetary value of an extremity. The doctor should decide only the extent of the anatomical and functional loss of the extremity. He is a specialist in this field, but he is not a specialist in monetary values.

The patient, no doubt, will desire to consider the partial loss of a finger or two equivalent to 100 per cent of as much as he can get.

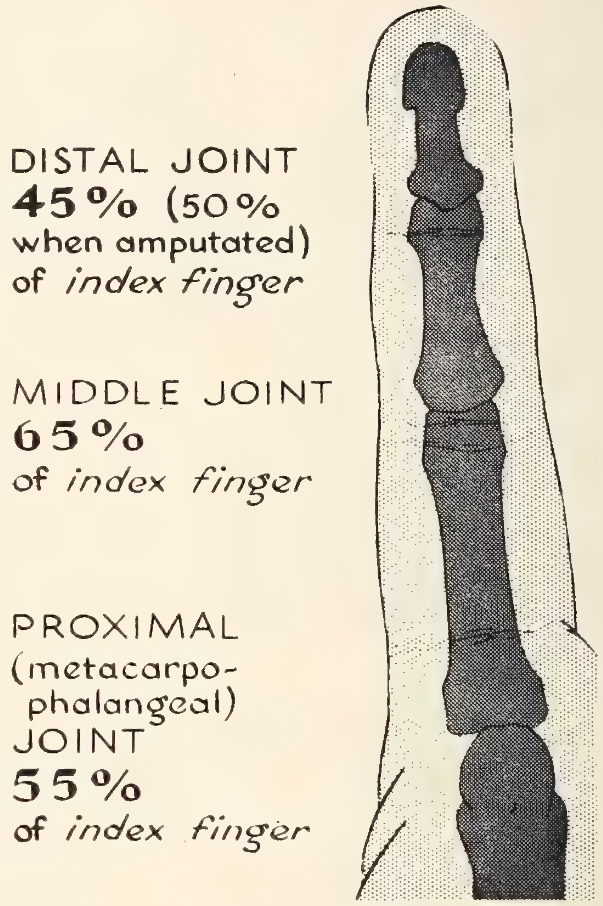
Terminology.—The industrial laws in each state indicate specific indemnity values for "the loss of, or the loss of use of, an indusrial member." For less than complete loss of an industrial member, the law specified "that the partial loss of a member shall be paid for as a percentage of the whole member."

Within these legal stipulations the doctor is expected to determine the percentage loss of the industrial member.

The "industrial member" may be defined as one of the anatomical parts for which a specific indemnity is awarded by the industrial law. These have been specified in the upper extremity as a "thumb," an "index, middle, ring, and little finger," a "hand," a "hand and wrist," and the entire "arm."

In the lower extremity the industrial members are defined as the "great toe," the "other toes," "the foot," the "foot and ankle," the "leg below hip," and the "entire leg."

These industrial members are, on the whole, uniformly designated in all states. Any disability evaluation must be made on the basis of one of these. It must be made on the basis of the smallest industrial member within which all of the disability factors can be included.



DISTAL JOINT
45% (50% when amputated) of *index finger*
MIDDLE JOINT
65% of *index finger*
PROXIMAL (metacarpo-phalangeal) JOINT
55% of *index finger*

Fig. 1. The relative value of the units of the finger. From Rice, Carl O.: The Calculation of Disability of the Extremities. Springfield, Ill.: Charles C Thomas, Publishers, 1952.

If, for example, a disability has been incurred in a hand and also in the elbow of the same arm, the sum of these disabilities must be established as representing a percentage of the entire arm. It would not be correct to give a disability to a hand separately and to the elbow in the same arm separately. The two must be combined to represent the disability to the entire arm, this being the smallest member within which both of these units can be placed.

Presented at round-table discussion at the annual meeting of the Minnesota State Medical Association, Minneapolis, Minnesota, May 28, 1952.

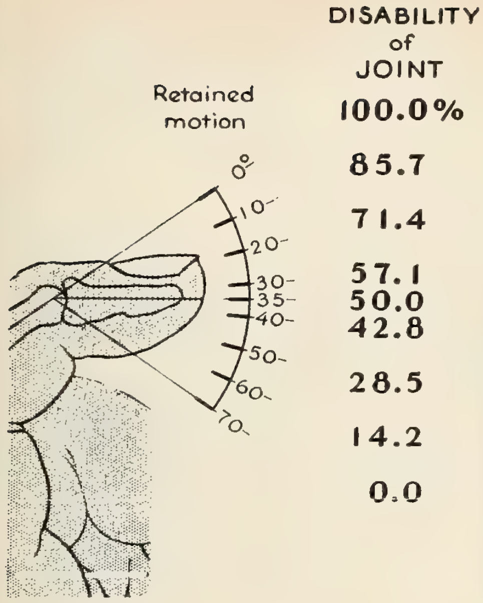


Fig. 2. The percentage of disability of the distal joint of the finger calculated for each 10° of retained motion.

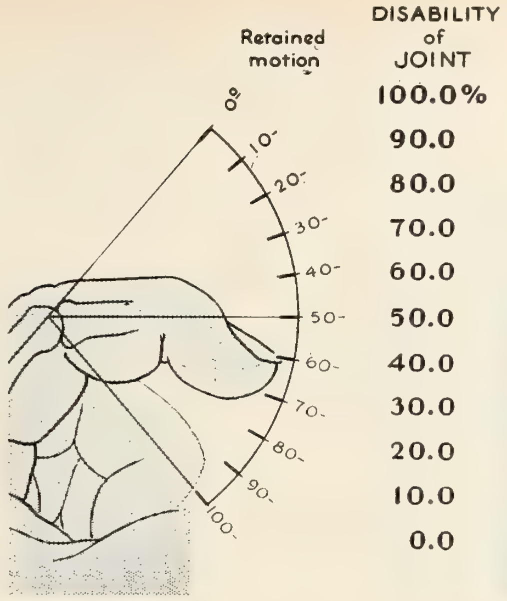

Fig. 3. The percentage of disability of the middle joint for each 10° of retained motion.

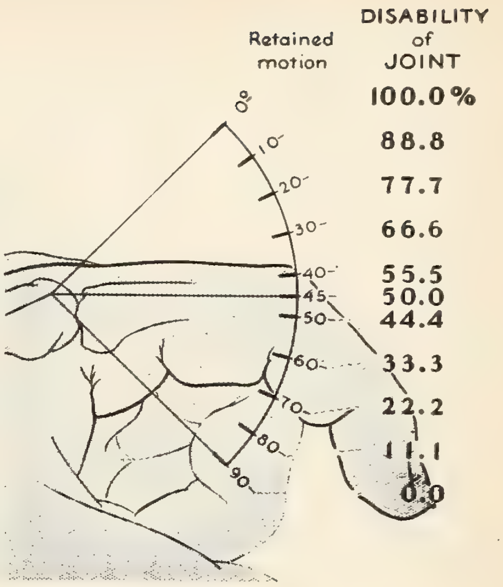

Fig. 4. The percentage of disability of the proximal joint of the finger for each 10° of retained motion.

Relative Values.—Disability calculations must be made so that they are compatible with the industrial law. In that the industrial law specifies certain indemnities for certain industrial members, or portions of an industrial member, it then becomes possible to establish values for portions, or units, of the industrial member in relation to the whole industrial member.

For example, the industrial law of the State of Minnesota has specified 150 weeks of indemnity for the loss of a hand, and 200 weeks of indemnity for the loss of an arm. This, then, gives the hand a value of 75 per cent of an arm.

$$\frac{150 \text{ (indemnity value — of the hand)}}{200 \text{ (indemnity value of the arm)}} = 75\% \text{ (value of hand in relation to the arm)}$$

In a similar manner it has been possible to establish relative values for each joint of the finger in relation to the whole finger, each finger in relation to the hand, and the hand in relation to the entire arm.

In this manner the distal joint has obtained a value of 45 per cent, the middle joint a value of 65 per cent, and the proximal joint a value of 55 per cent of the finger (Fig. 1). These values have been established partly on the basis of industrial law stipulation and partly on the basis of functional usefulness.

Disability of the Joint.—The ability to impart motion to an extremity is a criterion of its usefulness. To that extent, the useful range of motion in a joint can be used to calculate the percentage of useful motion. Conversely, the lost motion in a joint as compared to that in a normal joint determines its disability. In that it is easier to measure the degrees of retained motion, Figures 2, 3 and 4, showing the percentage of disability with each 10°, have been calculated from the degrees of retained motion in relation to the average normal range of motion.

It can be noted that 20° of retained motion in each of these joints would represent 71.4 per cent disability to the distal joint, 80 per cent disability to the middle joint, and 77.7 per cent disability to the proximal joint. The different disabilities in each joint is due to the fact that the normal range of motion is different in each of these joints.

The above disabilities represent the disability of the joint in each instance. The calculation for the disability of the finger has not yet been completed in that the value of the joint in relation to the entire finger has not been given consideration.

The Disability of the Finger.—In order to obtain the disability of the finger, the disability of the joint is multiplied by the value of the joint in each instance. When the disability of each of these joints is multiplied, each by its respective value,

then we obtain the disability of the entire finger as contributed by the joint.

If the same examples were used as suggested above, namely, 20° of retained motion, it would be found that the 71.4 per cent disability of the distal joint would constitute 32.1 per cent disability of the finger.

71.4 per cent (disability of the distal joint) × 45 per cent (value of the distal joint) = 32.1 per cent (disability of the finger as contributed by the distal joint).

In a similar manner 80 per cent disability of the middle joint constitutes 52 per cent disability of the finger: 80 per cent × 65 per cent = 52 per cent, and

77.7 per cent disability of the proximal joint constitutes 42.7 per cent disability of the finger: 77.7 per cent × 55 per cent = 42.7 per cent.

If only one joint is disabled, these calculated values, as shown in Figures 5, 6 and 7, represent the final disability of the entire finger.

If, however, multiple units are involved with disability, it will be noted that the sum of these units may exceed 100 per cent of the finger far in advance of 100 per cent disability.

Therefore, when multiple units of an industrial member are involved with disability, the disability of each unit, other than the distal unit, must be reduced by an equation lest the sum of the units exceeds 100 per cent far in advance of 100 per cent industrial disability. This equation may be expressed in the following manner:

$$\frac{\text{Disability of distal joint} \times \text{value of distal joint}}{1} + \frac{\text{disability of middle joint} \times \text{the value of middle joint}}{2} + \frac{\text{disability of proximal joint} \times \text{value of proximal joint}}{3} = \text{Disability of the entire finger.}$$

For the finger 100 per cent disability would result when each of its units is 100 per cent disabled.

$$\overset{\text{Distal}}{\frac{100\% \times 50}{1}} + \overset{\text{Middle}}{\frac{100\% \times 65}{2}} + \overset{\text{Proximal}}{\frac{100\% \times 55}{3}} = 100.8\%$$

The distal phalanx would receive a value of 45 per cent instead of 50 per cent if there were no amputation or damage in its tactile tip. In that instance the maximum disability of a rigid finger would be 95.8 per cent.

$$\frac{45}{1} + \frac{65}{2} + \frac{55}{3} = 95.8\%$$

If the same disability calculation is now carried into all of the joints of the finger wherein each of its joints retains only 20° of its motion, then it can be seen that the finger with this amount of motion will be 72.37 per cent disabled (Fig. 8).

The Disability of a Hand.—If these figures are then carried over into a disability of a hand, assuming that each finger and the thumb retains only 20° of motion in each of its joints, the calculations would reveal that each finger would be 72.37 per cent disabled, and the thumb and its metacarpal would be 67.12 per cent disabled.

		Total	82.03%

Fig. 9. The sum of the disabilities of the fingers constitutes the disability of the hand.

The fingers and the thumb constitute the industrial hand. They represent the units of the hand.

My multiplying the disability of each of these units of the hand by their respective values in relation to the hand and obtaining the sum of these, it is then determined that the hand is 82.03 per cent disabled when each joint retains only 20° of motion. This is illustrated in Figure 9.

Disability of the Arm.—If the wrist, elbow and shoulder are also disabled, each retaining only 20° of their normal arc of motion, the wrist would be 85.2 per cent disabled, the elbow would be 86.6 per cent disabled, and the shoulder would be 90 per cent disabled.*

Fig. 10. The disabilities in each unit of the arm and the equation for calculating the disability of the entire arm.

The sum of the disabilities of each of these units of the entire arm exceeds 100 per cent by a very large margin, and it, therefore, again becomes necessary to substitute these disability values into the equation as previously described.

The final calculation (Fig. 10) illustrates that the arm would be 100 per cent industrially disabled, though it still retains 20° of motion in each of its joints. This small amount of motion would possess no industrial value.

Comments and Conclusions

These illustrations demonstrate how a disability can be calculated. It is not possible to explain, in the time allotted here, how all of these values and how this method of calculating a dis-

(Continued on Page 784)

FRACTURES OF THE DISTAL PART OF THE FOREARM IN CHILDREN

Correction of Deformity by Growth

RAYMOND G. GIBERSON, M.D., AND JOHN C. IVINS, M.D.
Rochester, Minnesota

THE treatment of fractures in children should be guided by the same general principles that are used in treating fractures in adults. The bones of a child, however, respond differently because they are capable of growth as well as repair. Their capacity for growth may be an aid to the surgeon in the correction of deformities resulting from imperfect reduction, or may, on the other hand, be the cause of later deformity due to epiphyseal damage at the time of fracture or manipulation.

Fracture of the shaft of the bones of the forearm is a common injury in childhood. It occurs usually in the distal third, 1 to 2 inches (2.5 to 5 cm.) above the wrist, and often involves both bones. The majority of these fractures are seen in children less than ten years of age. It may be comforting at times to know that growth will correct a surprising amount of deformity. We propose to present evidence of this correction in the cases described in this paper. It is our purpose, furthermore, to emphasize certain practical points in the management of such fractures in children.

Incidence

The lower third of the forearm probably is the most frequent site of fracture in children. Beekman and Sullivan reported on 2,094 fractures of the long bones in children less than thirteen years of age seen at Bellevue Hospital. The radius was the bone most frequently fractured, being injured in 933 cases (45 per cent). Eighty-two per cent of these fractures of the forearm were in the distal third. Bagley, in a study of 200 consecutive fractures of the forearm involving both bones, found that 110 occurred in children less than ten years of age and that 101 occurred in the distal third. Thorndike and Dimmler reported on 364 fractures of the forearm and elbow in children and stated that 200 of these were in the distal third of the forearm.

Anatomic Factors

The majority of these fractures are caused by a fall on the outstretched hand and a smaller number are produced by direct violence. In the latter instance, the fractures in the bones of the forearm tend to be at the same level, while in those fractures caused by indirect violence the ulna is likely to be fractured at a lower level than the radius.[11] In a fall on the outstretched hand the force is transmitted to the humerus chiefly by the radius.[3] The fibers of the interosseous membrane are directed downward and mesially and only a small part of the force is transmitted to the ulna.

The lines of fracture usually are transverse but they may have varying degrees of obliquity. The types of fracture may be greenstick, complete, incomplete or multiple. Impaction is rare and the interosseous membrane usually is intact.

A similar force in the adult causes the fracture described by Colles. In this type, the fracture is located ½ to 1 inch (1.3 to 2.5 cm.) above the wrist and impaction and dorsal displacement of the distal radial fragment occur, together with avulsion of the styloid process of the ulna.

Correction by Growth

Longitudinal growth of bone is dependent entirely on multiplication of the cartilaginous cells in the cartilaginous plate of the epiphysis.[10] However, stimulation of growth in the length of the bone commonly takes place in fractures of the shaft. The hyperemia resulting from the callus causes hyperemia of the periosteum, and since the epiphysis receives its blood supply through the periosteum, growth is more rapid in the adjacent cartilaginous plate. When malposition and excess callus occur, the stimulation to growth will be greater than when a fracture is reduced anatomically. This overgrowth is not compensatory, however, and also occurs in shafts with perfectly reduced fractures. The average overgrowth is about 1 cm.[5] In general, the amount of overgrowth increases directly with the amount of callus present and the length of time that it persists.

It has been observed by Bagley that, when

Read at the annual meeting of the Minnesota State Medical Association, Minneapolis, Minnesota, May 28, 1952.

Dr. Giberson is a Fellow in Surgery, Mayo Foundation, and Dr. Ivins is with the Section of Orthopedic Surgery, Mayo Clinic, Rochester, Minnesota.

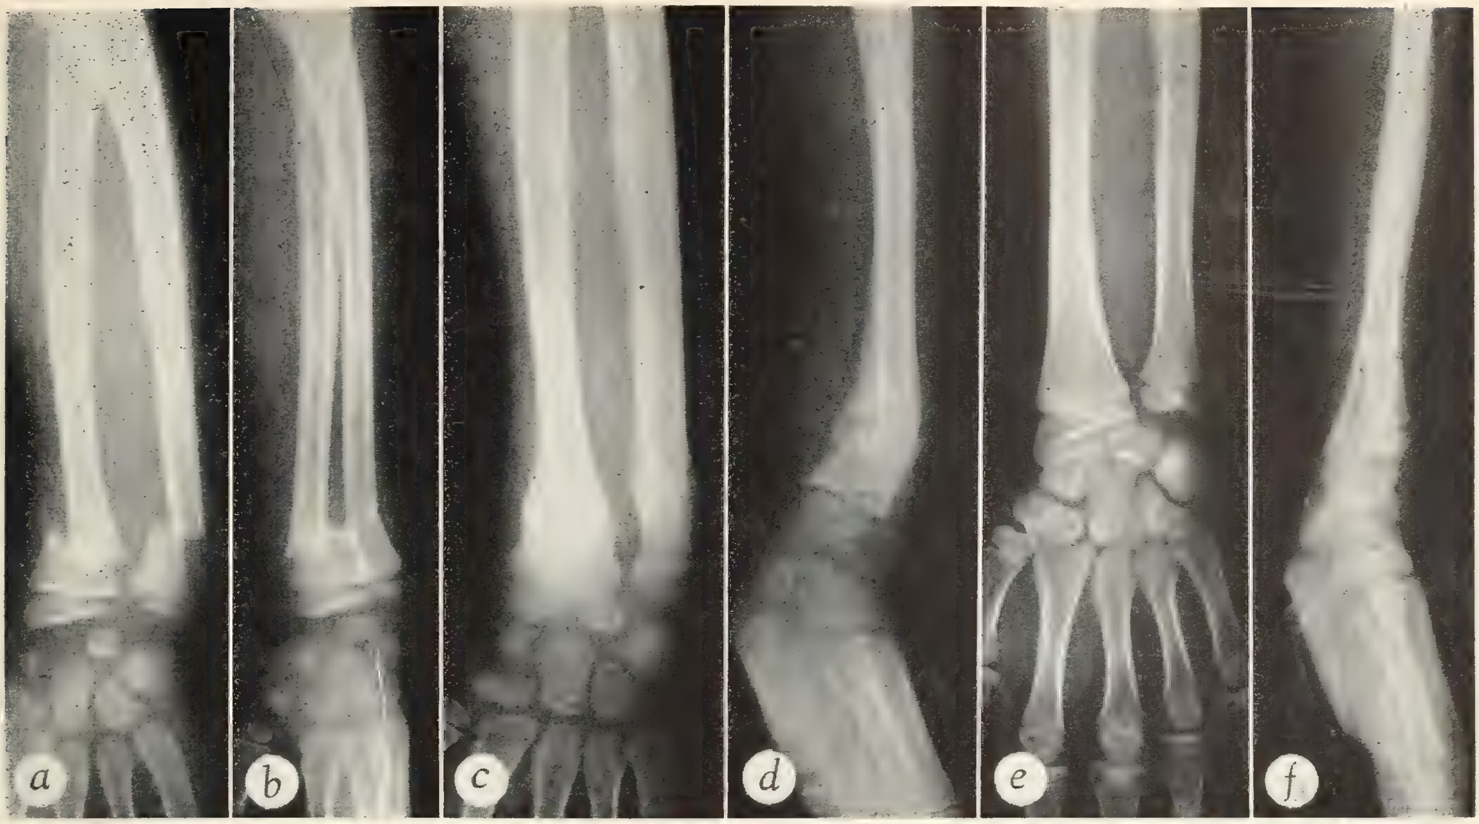

Fig. 1. Case 1. (a and b) Fracture sustained April 20, 1946. (c and d) June 3, 1946, six weeks after closed reduction. (e and f) Final result, March 29, 1952.

bowing occurs, the callus is laid down on the concave side of the deformity. Little or no callus is laid down on the convex side except when the periosteum is raised from the bone by displacement of the bony fragments. Bagley was of the opinion that this is due to the relaxation of the periosteum and soft tissues on the concave side with resulting hemorrhage, formation of clot, calcification and, later, bony formation. This deposition of new bone takes place early, while the arm is still in a cast, and apparently does not occur in accordance with demands made on the bone as to function.

Later, the deformity is corrected in accordance with Wolff's law, with laying down of bone in one place and resorption from another. Mainland has stated Wolff's law as follows: "After its formation, bone is built and unbuilt largely in response to the demands made on it. Its finer details and later modifications are due largely to external forces."

Blount[6] stated that the younger the child and the nearer the fracture is to the end of the bone, the greater will be the power of correction. He also pointed out that, in fractures of the middle third, accurate alignment is imperative at all ages since growth does not so greatly influence angulation at this level.

Aitken[1,2] has shown that growth will correct a surprising amount of deformity due to epiphyseal separation, even though the injury occurs near the time of epiphyseal fusion. He has noted correction of displacement by growth and ossification that was complete nine months after the injury. It probably is true that correction by growth when the fracture is located away from the epiphysis is not so rapid and thus, after the age of twelve years in the female and the age of thirteen years in the male, the physician should be more particular regarding reduction. The distal radial epiphysis fuses at about the age of fifteen years in the female and at the age of seventeen years in the male.[1,2]

Epiphyseal Injuries

The lower radial epiphysis is separated more frequently than any other and this separation makes up about 2 per cent of the injuries to the radius.[5] Damage to the cartilaginous plate is rare, and reduction usually is accomplished easily. If it is not reduced easily, however, conservative treatment is indicated since normal alignment almost always is re-established. The end result is not dependent wholly on the reduction accomplished but is determined in part by the amount of injury to the epiphyseal cartilaginous plate at the time of injury or reduction.

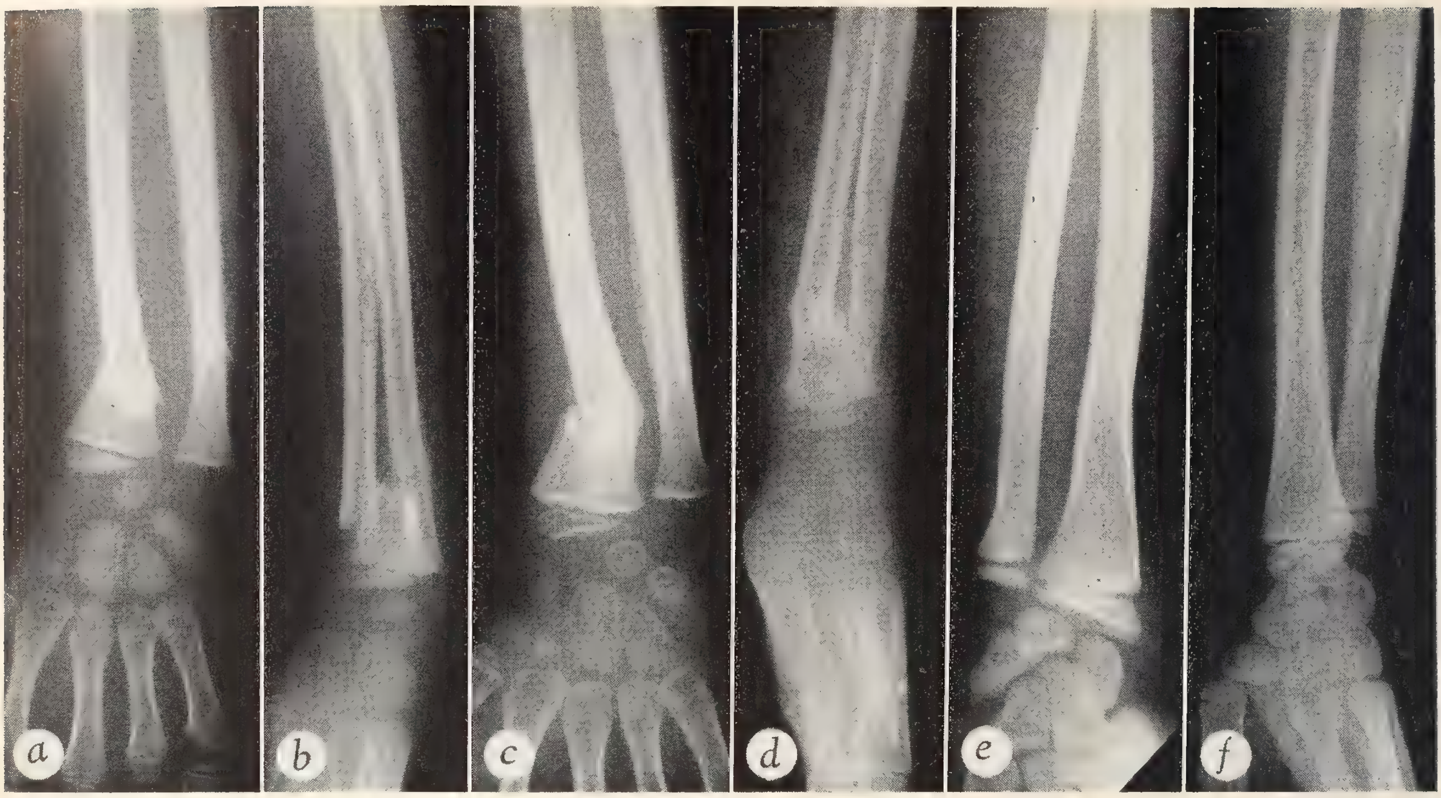

Fig. 2. Case 2. (a and b) Fracture sustained October 24, 1946. (c and d) December 10, 1946, six weeks after closed reduction. (e and f) Final result, March 11, 1952.

Method of Study

We have reviewed the roentgenograms of fractures in the distal third of the forearm in children twelve years of age or less who were treated at the Mayo Clinic since 1945. We found fifteen cases worthy of study in which there was residual deformity at the time when the patient was dismissed (about eight weeks after the injury in most cases). For purposes of comparison with these fifteen cases in which there was residual deformity after primary healing, we studied ten cases in which there was anatomic reduction of the fractures. Recent roentgenograms were made of these forearms and were compared with those made previously. The records of the cases were reviewed.

Report of Representative Cases

Case 1.—A seven-year-old boy fell a distance of 7 feet out of a haymow on April 20, 1946, sustaining the fractures shown in Figure 1, a and b. Closed reduction under general anesthesia was accomplished shortly afterward in the hospital. A circular plaster cast was applied from the metacarpophalangeal joints to the axilla, with the forearm in midposition and the elbow flexed to an angle of 90 degrees. Fixation was maintained for six weeks. Considerable deformity was present on June 3, 1946, after primary healing had occurred (Fig. 1, c and d). No further treatment was carried out. Roentgenograms made March 29, 1952, show the final result (Fig. 1, e and f). Clinically, the forearm is normal.

Case 2.—A six-year-old boy fell a distance of 10 feet out of a haymow on October 24, 1946. The fracture that he sustained (Fig. 2, a and b) was reduced by closed manipulation the same day and a circular cast was applied to the forearm and allowed to remain in place for six weeks. Roentgenograms made at the time of dismissal on December 10, 1946, showed the deformity illustrated in Figure 2, c and d. No residual deformity can be seen in the roentgenogram taken on March 11, 1952 (Fig. 2, e and f).

Case 3.—An eight-year-old girl sustained fractures of both bones of the left forearm in a fall from a swing on July 31, 1949 (Fig. 3, a and b). Closed reduction under general anesthesia was carried out after admission to the hospital. A circular plaster cast was applied from the distal palmar crease to the axilla, with the forearm in midposition and the elbow flexed to an angle of 90 degrees. Fixation was maintained for seven weeks. The deformity shown in Figure 3, c and d, was present on September 19, 1949. The latest roentgenograms, made on March 6, 1952, show little deformity and clinically the forearm is normal (Fig. 3, e and f).

Case 4.—A six-year-old boy fell on his outstretched arm on June 6, 1951. This resulted in the fracture illustrated in Figure 4, a and b. The fracture was reduced by closed manipulation and a cast applied as was done in Case 3. Considerable deformity was present on July 3, 1951 (Fig. 4, c and d). Extensive correction of the deformity has taken place in nine months, as shown by the roentgenogram made on March 27, 1952 (Fig. 4, e and f).

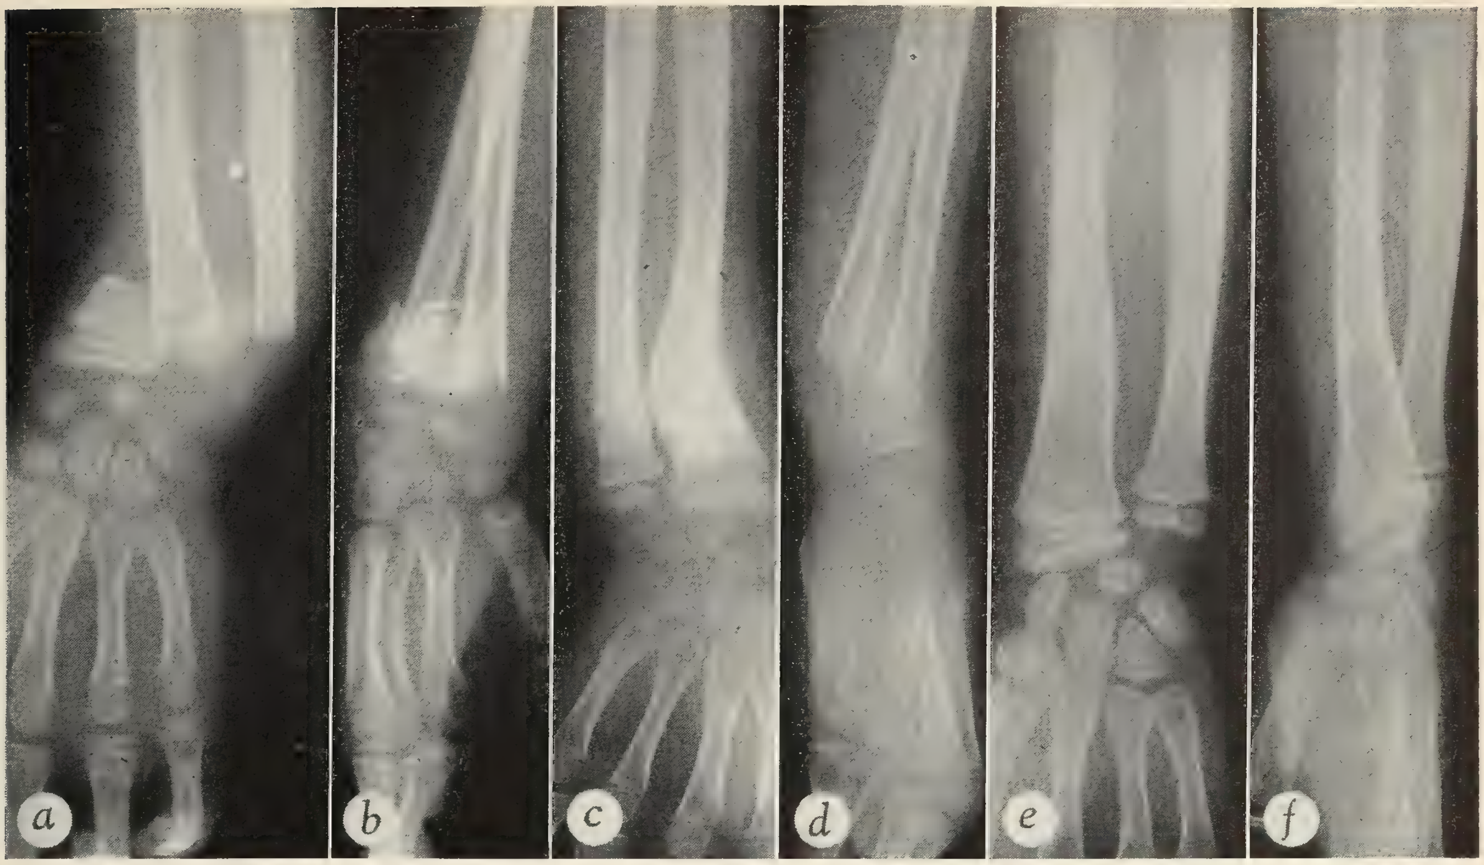

Fig. 3. Case 3. (a and b) Fracture sustained July 31, 1949. (c and d) September 19, 1949, seven weeks after closed reduction. (e and f) Final result, March 6, 1952.

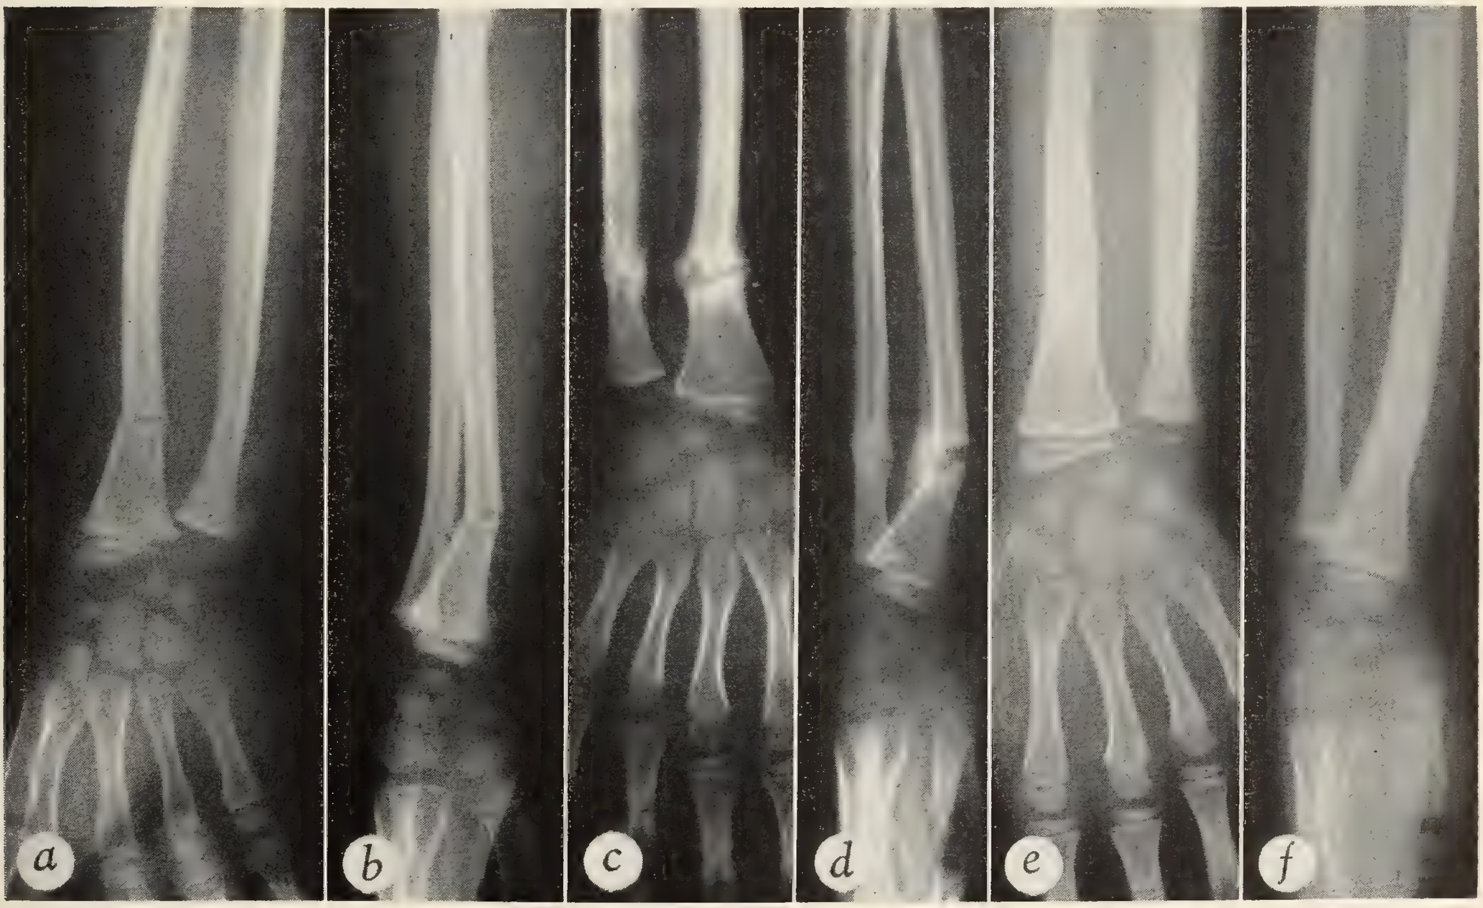

Fig. 4. Case 4. (a and b) Fracture sustained June 6, 1951. (c and d) July 3, 1951, four weeks after closed reduction. (e and f) Final result, March 27, 1952.

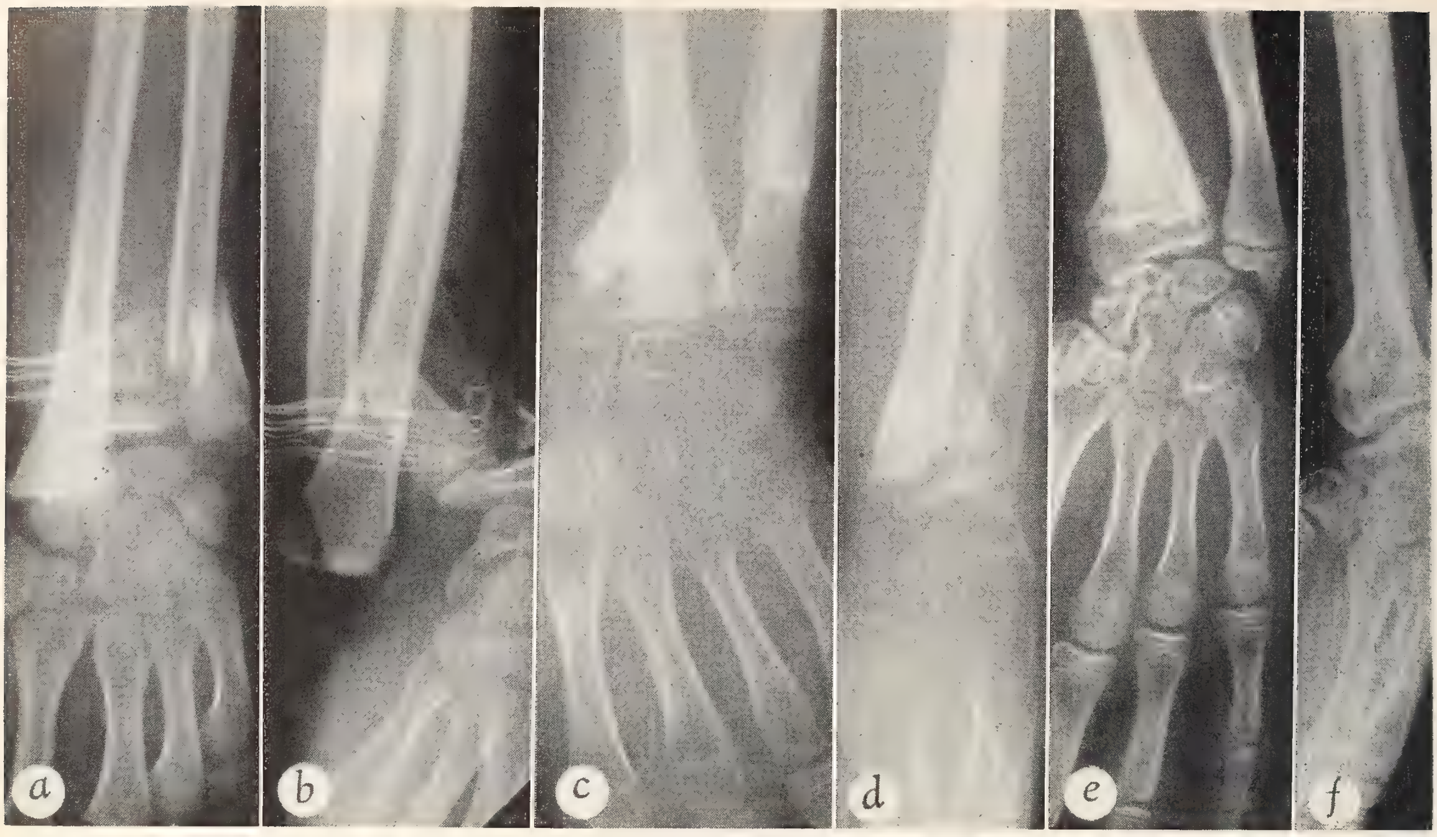

Fig. 5. Case 5. (a and b) Fracture sustained August 24, 1950. (c and d) November 1, 1950, nine weeks after closed reduction. (e and f) Extent of correction on January 17, 1952.

Case 5.—A twelve-year-old boy fell from a tree on August 24, 1950, and sustained a compound fracture of the left wrist with displacement of the distal radial epiphysis, in addition to fractures of the shafts (Fig. 5, a and b). The fractures and epiphyseal separation were reduced by closed manipulation and fixation maintained for four months. Roentgenograms made on November 1, 1950, illustrate the state of repair (Fig. 5, c and d). The latest roentgenograms, made on January 17, 1952, show remarkable correction of the deformity of the shaft but there is relative overgrowth of the ulna with radial deviation of the hand (Fig. 5, e and f). Growth in the radial epiphysis has been retarded as a result of injury and segmental resection of the ulna has been advised.

Comment

It is evident from study of these cases that growth is able to correct a remarkable amount of deformity resulting from a fracture in the distal third of the forearm in children. Accurate reduction is desirable and every effort should be made to restore anatomic relations at the first attempt by closed reduction. In the event that accurate reduction is not obtained or should angulation recur after the cast has been applied, it is better to accept something less than perfect reduction than to perform repeated manipulations or open reduction.[8,14] Practically no fracture occurs in the distal third of the forearm in children that cannot be treated better by closed than by open methods.

Blount[7] has noted that a perfect functional result and, after a year, a perfect anatomic result will ensue in a young child without the ends of the bone being in apposition if alignment is reasonably good. The younger the child and the nearer the fracture is to the end of the bone, the less particular the physician needs to be.

In this study, the end results were the same for patients in whom the deformity after reduction occurred as for those in whom fractures were anatomically reduced. In no patient in whom the shaft alone had been injured was there any impairment of function or any evidence of the previous deformity one year after injury.

These fractures should be treated as emergencies and reduction should be obtained early. However, if the fracture occurs just after the child has eaten, as so often obtains, it is wise to splint the arm and defer manipulation until the stomach is empty, which requires twelve to twenty-four hours. Adequate premedication should be given. A mixture of nitrous oxide, oxygen and ether is the anesthetic agent of choice in most cases.

When the fracture is of the greenstick variety and if angulation of less than 30 degrees is present, reduction is not necessary. If more angulation than this is present, it should be corrected by manual compression under anesthesia. It is not necessary to complete fracture of the cortex in this instance.

When one bone remains intact, which usually is the ulna, it can be used as a lever to reduce the fracture in the other. With complete fracture of both bones, reduction may be difficult and once obtained it may be difficult to maintain. A satisfactory method of reduction has been described by Key and Conwell.

We apply a long circular plaster cast to the arm from the metacarpophalangeal joints to the axilla, with the forearm in midposition and the elbow flexed to an angle of 90 degrees. When a greenstick fracture exists with little deformity, and in the event that no reduction is attemped, application of a cast to the forearm is sufficient. In those fractures in which it is difficult to maintain position it may be necessary occasionally to apply simple traction by means of a banjo splint incorporated in the cast.

Minor displacements of the radial epiphysis may be left unreduced.[12] Complete separation usually is reduced easily when it is treated soon after its occurrence. Repeated manipulation and open reduction are not indicated, since normal restoration of alignment will take place in the presence of displacement if the epiphyseal cartilage has not been damaged.

Summary

A study has been made of the end results of fractures of the distal third of the forearm in fifteen children who were twelve years of age or less and in whom there was residual deformity of the forearm on completion of treatment. These forearms eventually became practically normal in all respects, and the results in no way differed from those obtained after anatomic reduction of similar fractures in ten patients. Every attempt should be made, of course, to restore anatomic relations in the reduction of these fractures, but repeated manipulation is seldom necessary and open reduction rarely required because growth will correct a surprising amount of deformity that may be present as a result of these fractures.

FACTS TO REMEMBER

In the last national election, 44,870,320 Americans didn't bother to vote, although 93,704,000 were eligible to cast a ballot. Only 52 per cent went to the polls. In Minnesota, only 63.6 per cent of the voting population exercised their privilege of voting. In 1948, a total of 1,906,000 Minnesotans were eligible to vote; yet 693,777 remained at home, according to a tabulation by Minnesota Taxpayers Association.

RESUSCITATION OF THE NEWBORN

ELLIS N. COHEN, M.D.
Saint Paul, Minnesota

STATISTICS published in a recent editorial in *The Journal of the American Medical Association*[5] estimate that infant mortality in the first few days of life exceeds 120,000 per year. A 14-year study of needless neonatal deaths conducted by the Chicago Health Department from 1935-1949 brings us a breakdown of these imposing figures.[2] Most significantly, the largest percentage of neonatal deaths (51.9 per cent) occurs during the first 24 hours of life. The authors list the cause of death percentage-wise as follows:

	Per Cent
Abnormal pulmonary ventilation	54.3
Injuries at birth	18.2
Malformations	12.0
Infections	6.2
Anoxia	4.7
Miscellaneous	4.6

We thus see that the pathological factors involving respiration are by far the most important to be considered. Unfortunately, the correction of the majority of these factors still does not lie within our present grasp of knowledge. Nevertheless, prompt and adequate treatment will offer much, both in the actual saving of life, and perhaps even more important in the reduction of irreversible cerebral damage attendant to inadequate oxygenation.

A brief review of the physiological changes that must occur in the fetus before respiration in the outside world can begin, serves to give us a clearer understanding of these dramatic changes and at the same time points up our woefully inadequate information on these very same facts.

Many studies[1,13] indicate that initiation of respiration is not delayed to the moment of birth, but actually begins much earlier in the gestation period. Most of these studies involve the injection of some particulate matter into the amniotic sac before delivery and then studying its distribution in the lungs of experimental animals sacrificed upon delivery. Whether this is effective constant respiration, and what initiates and stops it, are questions that yet remain to be answered.

The initiation of extra-uterine respiration has puzzled physiologists for many years. Basically, the stimuli carbon dioxide, hydrogen ion concentration, and oxygen lack that control respiration in later life, are probably the same ones that initiate it prenatally or at birth itself, the fundamental difference, of course, being the threshold level of response in the newborn and in the adult.

There are, to be sure, many other ways of stimulating respiration besides hydrogen ion concentration, carbon dioxide, and oxygen want. Pain, cold, cutaneous stimuli, do produce reflex respiratory gasps. However, one may speculate that these stimuli are inadequate if the physiological stimulus itself is ineffective, and that when respiration does follow a simple cutaneous stimulus like spanking, the infant's respiration would probably have begun in a moment anyway without the spank.[12]

Specifically, however, in the light of present knowledge what measures can be adopted to initiate and maintain adequate respiration in the infant suffering from asphyxia? Ross and Strong[11] a number of years ago made an exhaustive study of techniques available for resuscitation of the asphyxiated infant. These varied from outmoded methods such as alternate immersions in hot and cold water, to the use of complicated mechanical apparatus. In a study of fifteen methods, these authors comment that "practically any child can be revived by the use of intratracheal catheter and alternate inspiration and expiration through the catheter." Although this statement may be overly opimistic it emphasizes a further statement by these authors that this, "one procedure, easily learned after two or three demonstrations, should save most of the babies that would otherwise die from asphyxia."

Flagg,[6] founder of the Society for the Prevention of Asphyxial Death, presents a comprehensive review of the value of the intratracheal catheter technique. He outlines three basic principles in infant resuscitation:

1. Exposure of the field
   (laryngoscopy under direct vision)
2. Removal of foreign material
   (suction of fluid and the relief of the obstruction).

Read at the annual meeting of the Minnesota State Medical Association, Minneapolis, Minnesota, May 28, 1952.

3. Application of treatment, directly to the damaged area with the greatest possible precision, dispatch, and absence of trauma.
   (intubation by direct vision and insufflation of oxygen, carbon dioxide under controlled pressure).

These basic principles elaborated fourteen years ago still stand as fundamental concepts in infant resuscitation. The only point that might be questioned is the suggested use of carbon dioxide. Experimental work done by different observers, including Kane and associates[7] showed "that the carbon dioxide content of the blood in the newborn (taken from the umbilical cord) is consistently high; that the proportion of carbon dioxide increases with the degree of asphyxia, and therefore, that the addition of carbon dioxide to oxygen as a resuscitating agent is contraindicated."

For the purpose of our discussion one might divide those infants requiring resuscitative efforts into two groups: the first efforts to be used in the mildly depressed infant, and the second efforts to be undertaken unhesitatingly if our first simpler technique fails, and to be used directly in all cases of the severely asphyxiated infant.

Although the obstetrician assumes the first responsibility for the infant's airway by customarily aspirating the infant's pharynx with a rubber bulb syringe or else inverting the infant and stripping mucus from his throat by a massaging sweep of his gloved finger from the lower jaw towards the mouth, frequently this simple effort is not an adequate one. Immediately at this point the assistant obstetrician, the pediatrician, or the anesthesiologist must begin the first series of additional resuscitative efforts. These consist of further freeing of the infant's airway through introduction of a soft tipped rubber catheter into the mouth and posterior pharynx and aspirating directly. A carefully controlled suction will withdraw any mucus or blood present and not obtained with the bulb syringe. At the same time, one offers to the infant a high concentration of oxygen given with a closely fitting mask by positive manual pressure through a breathing bag. Redundant as it may sound, it is essential to actually observe motion of the thorax and the diaphragm with each manual compression of the breathing bag. Merely applying 100 per cent oxygen to the infant's face and not providing for its actual entrance into the lower respiratory tract by inflating the lungs, allows the majority of the oxygen to dissipate to the atmosphere and only a relatively small amount reaches the blood stream through the mechanical action of the heart, the so-called "hemoglobin oxygen pump."[3] Frequently, this suctioning of the pharynx plus manual inflation of the lungs with the oxygen are sufficient to initiate adequate spontaneous respiratory movements.

If, within a matter of a moment or two, these simple measures do not produce voluntary respiratory exchange with a marked improvement of cyanosis, one should not hesitate to begin the second group of resuscitative efforts. This consists in the implementation of the principles set forth by Flagg: namely, exposing the larynx under direct vision, the removal of any foreign material present deep in the pharynx, or in the tracheobronchial tree itself by suctioning with a catheter, and finally the insertion of a small No. 00 portex or soft rubber endotracheal tube. With the latter providing an assured airway, one can most effectively supply oxygen to the infant through a positive pressure technique. In addition, the endotracheal tube futher provides a good channel through which one may aspirate the tracheal bronchial tube. By carefully manipulating the infant's head one may frequently direct the soft suction tip into the right or left main stem bronchus as desired. Although this technique may seem complicated or even slightly formidable to the unpracticed, skill can readily be required through experience until intubation can be performed completely atraumatically. One of the oft-neglected teaching opportunities for the intern and resident is the use of the non-viable fetus on which to practice. Here one may practice exposure of the larynx and intubation without any fear of trauma and away from the urgency of providing oxygen to a precarious infant.

Even in our present inflated times, all the equipment necessary for these procedures may be purchased for less than $100.00. A simple positive pressure apparatus with breathing bag,* a Miller infant laryngoscope,† a soft No. 00 endotracheal tube, connectors, and a No. 8 French soft suction catheter comprise all the mechanical equipment required.

Special anatomic considerations of the infant's larynx have been well brought out in an article by Eckenhoff.[4] He points out the cephalad position of the infant's larynx as compared with the adult and the characteristic short stiff U-shaped epiglottis. Exposure of the larynx is best accomplished by passing the blade of the laryngoscope beneath the epiglottis into the post-cricoidal space, then slowly withdrawing it until the arytenoid cartilages appear in view. Elevation of the tip of the blade and slight forward movement will usually result in good exposure of the vocal cords.

In selecting the length of the endotracheal tube to be inserted, one bears in mind that the average distance from the gums to the glottis in the newborn is about 3 inches and about the same distance from the glottis to the tracheal bifurcation. The tip of the endotracheal tube must, of course, be somewhere in the last measured space.

When oxygen is supplied to the infant by manual alternate compression and release of the breathing bag, one must bear in mind the danger of too great pressure being applied to the lung alveoli. According to Flagg,[6] a pressure of 25 mm. Hg may be safely sustained for five seconds without danger of rupture of alveoli. In practice, one rarely exceeds 10 mm. Hg pressure and through experience accomplishes a sense of feel that prevents too great pressures being exerted on the breathing bag. A refinement of technique consists of a water manometer which automatically releases pressure in the system at a predesignated level.

Many mechanical devices have been suggested and utilized in resuscitation efforts. Most of these offer poor substitution for patiently and carefully performed manual techniques. One recent article pointing out hazards of intubation and manual technique offers as a substitute an expensive piece of apparatus which simulates pressure changes *in utero* and theoretically at least forces excess fluids and secretions from the upper respiratory tract. The effectiveness of such equipment in actually initiating respiration still remains to be proven. The use of incubators with close regulation of temperature, humidity, oxygen, etc., offer an ideal atmosphere to the infant once it has been resuscitated, but only after the latter has been accomplished.

The misuse of analeptics in stimulating respiration in infants as well as adults is well brought out in a recent article by Leffingwell[8] in which the author states, "delaying the start of pulmonary ventilation while drugs are prepared and injected may cost the patient his life. There is no known drug that will initiate respiratory activity that has ceased." Earlier experimental work by others, including Mousel and Essex,[10] support this contention. The action of most analeptic drugs is to further increase the baby's demand for oxygen in a patient already suffering from an inadequate supply of oxygen.

From a prophylactic point of view aspiration of gastric contents in the newborn infant may be a worthwhile effort. Little[9] shows a reduction of 50 per cent in the fetal mortality of infants delivered by cesarean section when prophylactic aspiration of the stomach was carried out immediately after birth. Since it has long been recognized that respiratory difficulties are highest in the cesarean section babies (probably due to a lack of the compression action of the uterus on the flexed chest in clearing the tracheobronchial tree) adequate suctioning of these infants and intubation may be especially important.

In closing, may we comment on the time at which one should begin resuscitation technique. Although it has been suggested that the newborn infant is probably better able to withstand oxygen want than his adult counterpart, it would seem logical that moments lost in beginning adequate respiration and oxygenation are lost never to be regained, and that the temporizing of several minutes waiting for the infant to begin breathing spontaneously through "natural phenomenon," may be the difference between superior or average intellect in the formative years to come. Surely, until good evidence to the contrary is available, immediate effective resuscitation is the least hazardous course to pursue.

Summary

1. The principles of adequate resuscitation in the severely asphyxiated newborn infant include direct exposure of the larynx, thorough suctioning of both the pharynx and tracheobronchial tree, insertion of an endotracheal tube, and manual control of respiration with 100 per cent oxygen supplied by positive pressure apparatus.

2. The use of complicated mechanical devices and analeptic drugs is questionable.

3. Time lost in beginning effective infant resuscitation may never be regained.

Clinical-Pathological Conference

Case Report

ARTHUR H. WELLS, M.D., M. EUGENE FLIPSE, M.D.,
and HAROLD H. JOFFE, M.D.
Duluth, Minnesota

History.—A sixty-nine-year-old white man, married, was first admitted about a month before his death to another hospital because of "progressive deterioration of his general physical condition." For several weeks he had had progressive loss of appetite and weight, a slight cough, questionable expectoration, and had been feverish. An x-ray film of the chest will be described later. Further study was advised, but the patient refused and left the hospital. Three weeks later and four days before his death he became confused, disoriented and restless and he coughed up, or vomited about a pint of bright red blood, and was readmitted to the same hospital.

Past History.—He had been a diabetic for at least ten years. His diabetes apparently had not been well controlled, for it is known that on several occasions he had had marked glycosuria with and without acetone, and yet had refused to follow medical advice. Seven years before he had required 50 units of protamine zinc insulin daily. More recent requirements are not known. There was no history of diabetic coma or insulin reactions.

Seven years and again three years before his final hospital admission he had midepigastric pain and tenderness, not otherwise described, which subsided in several days, undiagnosed and without treatment. An electrocardiogram, taken at the time of the first episode of pain, is said to have shown T waves that were "diphasic in I and II, low isoelectric in III, low and diphasic in IV." At the time of the second episode of pain enlargement of the liver was noted. The hepatomegaly persisted during the intervening three years. There was no known exposure to tuberculosis. His wife and children were living and well.

Physical Examination.—He was fairly well nourished, acutely ill, disoriented, irrational and restless. The mucous membranes of the lips were pale. On the skin of the abdomen on the left side there was a series of very small brownish discolorations arranged in linear distribution along the lateral border of the left rectus muscle. There was no other discoloration of the skin or mucous membranes. The pupils were small, irregular, reacted sluggishly to light but did not accommodate. Ears, nose and throat were normal. The thorax was symmetrical with normal mobility. The left hemithorax was clear to auscultation and percussion. Over the right basal area posteriorly moderately coarse rales were persistently heard but percussion sounds were normal. The blood pressure was 110 mm. of mercury systolic and 80 diastolic. The temperature was 98.8° F. and the pulse rate 78 per minute. The heart was normal except for tachycardia. The peripheral arteries were moderately sclerotic. The abdomen was markedly distended and tympanitic. The liver edge was felt 4 fingerbreadths below the costal margin in the midclavicular line, was hard, slightly tender to deep pressure and had a suggestion of nodulation. The spleen or other masses were not palpable. Genitalia were normal. There was no cyanosis, finger clubbing or edema. The deep tendon reflexes were normal but sluggish. No Babinski sign was elicited.

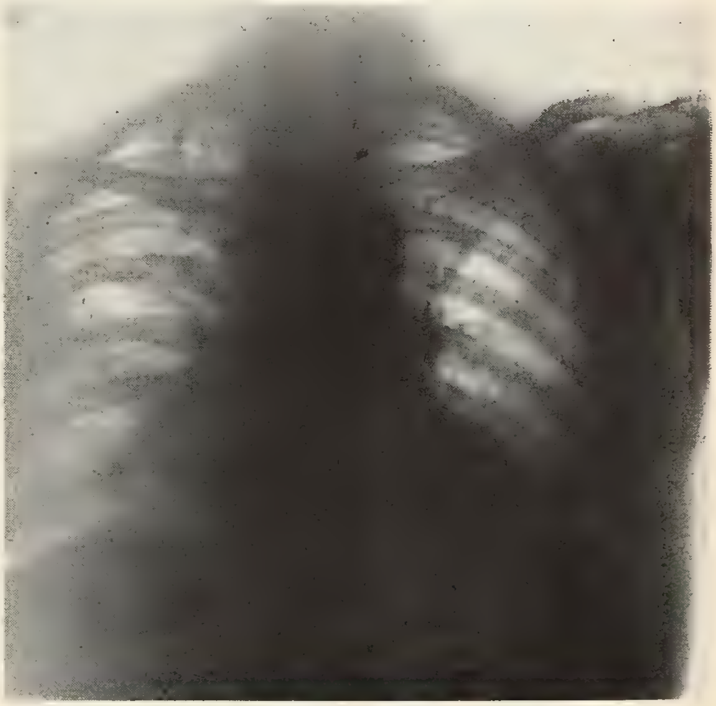

Fig. 1. Roentgenogram of chest.

Laboratory Data.—On admission the erythrocyte count was 3,620,000 per cu. mm., the leukocyte count 12,000 with 92 per cent neutrophils and 8 per cent lymphocytes, and the hemoglobin was 88 per cent. The urinalysis revealed sugar 2 plus, and microscopically 12 to 20 erythrocytes per field and numerous pus cells.

X-Ray Study.—Films of the chest (Fig. 1) taken about one month before his death revealed nodules 2 cm. in diameter in the upper and the lower lobes of the right lung; these were thought to be consistent with either pulmonary tuberculosis or malignancy.

Course.—During the terminal three days in the hospital he was irrational and semicomatose. His pulse varied from 78 to 120 per minute. No additional blood pressure readings were taken. The normal temperature which had been normal, rose to 100° F. on the last day.

Differential Diagnosis

Dr. M. E. Flipse: "Let us try to untangle the differential diagnosis, starting with the emergency entrance of this patient into the hospital with a history of having vomited, or coughed up, about a pint of bright red blood. Pulmonary bleeding in the adult is usually accompanied

---

From the Department of Pathology, St. Luke's Hospital, Duluth, Minnesota.

either by coughing, or by clearing the throat, and some patients experience a vague sensation in the chest which enables them to tell the approximate site of the hemorrhage. Blood from the lungs is often bright red and frothy, less frequently mixed with sputum or mucus. Hematemesis, on the other hand, is usually preceded by nausea and accompanied by retching, but bright red unchanged blood may well up in the throat and mouth from esophageal bleeding without associated symptoms. In this case the attending physicians were unable to decide between hemoptysis and hematemesis. The x-ray film of the chest suggests either tuberculosis or pulmonary neoplasm, both important causes of gross hemoptysis. We need not consider seriously other important causes of hemoptysis, such as bronchiectasis, mitral stenosis and pulmonary infarction; or the less frequent causes, such as ruptured aneurysm, hypertension, lung abscess and blood dyscrasias.

"I believe the episode of bleeding was hematemesis from esophageal varices secondary to portal hypertension produced by cirrhosis of the liver. There is nothing to suggest the other causes of hematemesis, namely, peptic ulcer, cancer of the stomach, hiatal hernia, leiomyoma of the stomach, and blood dyscrasias. The rapidly progressive mental deterioration and death of the patient after the loss of an amount of blood insufficient to produce shock or significant anemia, are quite compatible with cirrhosis. In many patients with chronic hepatic insufficiency the gradual downhill course may be rapidly converted into a terminal central nervous system type of disease by a mild infection, trauma, sedative or relatively minor blood loss.

"Uremia secondary to the so-called necrotizing renal papillitis, a fulminating type of acute pyelonephritis,[12] is a not uncommon but frequently missed complication of diabetes that could account for the terminal picture. The leukocytosis of 12,000 with a shift to the left and the urinary findings of blood, pus and bacteria would fit with this diagnosis. However, these findings are equally compatible with genitourinary tuberculosis or a nonspecific cystitis or prostatitis.

"Considering all the possibilities and the available information, I believe the terminal events were manifestations of cirrhosis; namely, hematemesis from esophageal varices leading to acute hepatic failure, cholemia and death.

"It might be argued that the evidence for cirrhosis is scant but an enlarged nodular liver known to be present for at least three years in a native American without heart failure, is most likely cirrhosis. The absence of spider angiomata, testicular atrophy and loss of hair does not exclude cirrhosis but only signifies that one of the many functions of the liver, the detoxification of estrogens, was not seriously impaired.[8] The failure to palpate a spleen in a distended and tympanitic abdomen is not surprising. Laboratory evidence of impaired liver function, at least a retention of bromsulfalein, would give strong support to the diagnosis of cirrhosis. However, Ricketts and associates[10,11] have shown that occasionally one may have marked hepatic disease, even cirrhosis, with no abnormality in known liver function tests. The evidence of macrocytosis in the blood noted three years ago and again a few days before death is compatitble with a diagnosis of cirrhosis.

"Hepatoma or primary carcinoma of the liver should be mentioned for it is found in approximately 7 per cent of cirrhotic livers and is practically never unassociated with cirrhosis. Its presence could account for the nodular and enlarged liver, rather than a shrunken liver, most commonly seen in cirrhosis. Metastatic carcinoma to the liver from the lung or from any other site, of this duration, would be most unusual.

"A punch or needle biopsy of the liver would have been the most valuable single test in this case as it is in any diabetic with a large liver. In this case, I believe, it would have proved the presence of cirrhosis, settled the problem of a superimposed hepatoma and, if my diagnosis is correct, would have established the etiology of the cirrhosis as being hemochromatosis.

"Sheldon[14] points out that 80 per cent of the patients reviewed had an onset with one of the well-known triad, diabetes, skin pigmentation and cirrhosis, and that there was an equal chance of any one of the triad being the presenting complaint. Feder,[4] in a recent review, emphasizes that only one of the triad may be present for long periods of time and that the cirrhosis is the most constant finding.[15]

"I believe most of the picture presented by this patient's illness can be explained on the basis of hemachromatosis. He had the diabetes. I have reviewed the evidence for the cirrhosis. The series of minute brownish areas of discoloration arranged in linear fashion along the lateral border of the left rectus muscle might have been the pigment of hemochromatosis. The extent and character of pigmentation in hemochromotosis may vary from complete absence, in 20 per cent, through a few non-specific specks to diffuse pigmentation of any shade between the melanosis of Addison's disease and the slate gray of argyria. In about half the cases with skin pigmentation the pigment is melanin, owing to disturbance in liver and adrenal function; in the rest it is the pathognomonic iron pigment hemosiderin, so easily detected by skin biopsy of the pigmented area with use of appropriate iron stains. Abdominal pain, either mild or severe and shocklike, has been described.[3,9]

"Even the nonspecific T wave changes in the electrocardiogram could be caused by the deposition of iron in the heart, for this is a common occurrence, usually without clinical manifestations, although heart block, auricular fibrillation and heart failure have been reported.

"Thus we can explain the entire picture except the lung lesion on the basis of hemochromatosis. The lung is one of the few organs spared by this disease. One might postulate metastasis to the lung from a hepatoma secondary to the pigment cirrhosis, but I would prefer the added diagnosis of pulmonary tuberculosis. I make this diagnosis because of the x-ray film, which suggests multiple cavities in the right upper lung field, and because poorly controlled diabetics have a high incidence of pulmonary tuberculosis. Lipoid pneumonia, common in old persons who take mineral oil as a laxative or as nasal drops is most unlikely."

Pathologic Findings

Dr. A. H. Wells: "I am sure you will agree that Dr. Flipse's differential diagnosis is a masterpiece of reasoning and interpellation. His conclusions are correct except for minor features. The patient did have hemochromatosis (Figs. 2, 3 and 4) with some of its complications. There was a moderately severe cirrhosis of the liver with dilatation of the venous bypasses and rupture of an esophageal varix. The entire gastrointestinal tract was filled with dark reddish purple blood. The loss of blood was probably the immediate cause of death. A multicentric hepatoma had developed in the cirrhotic liver and had metastasized to the right lung causing the opacities in the roentgen film of the right lung (Fig. 1). There were no lesions of pulmonary tuberculosis. An examination of the brain was refused. The entire clinical picture of this patient is explained upon the one disease, hemochromatosis, and its complications except for a focal area of acute pyelonephritis in the right kidney. This was probably a blood-borne infection and accounts for the findings of pus and blood in the urine.

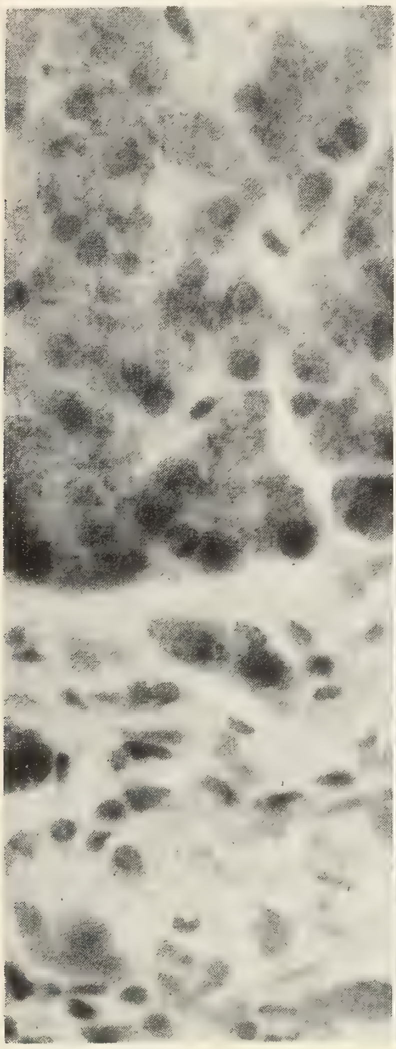

Fig. 2. (left). Degenerated liver cells in disrupted cords containing hemosiderin adjacent to scar tissue.

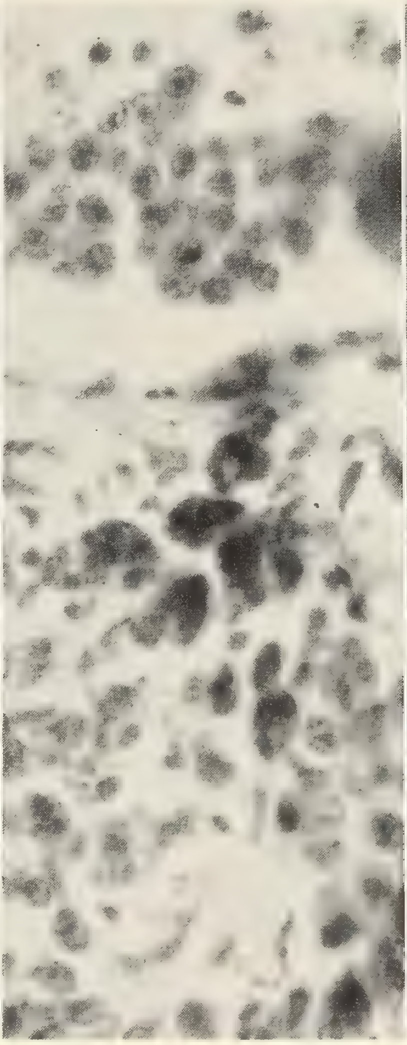

Fig. 3. (center). Hemosiderin in acinar cells, extensive destruction of acini, and relatively mild deposits of iron in the islets of Langerhans.

Fig. 4. (right). Over-developed photomicrograph of heart muscle to bring out minute hemosiderin granules in cytoplasm.

"Histologic studies were of unusual interest in the finding of multiple neoplasms among the cirrhotic nodules of the liver. These ranged from hyperplastic changes in the liver cells through adenomas with large droplets of inspissated bile, through papillary adenomas and adenocarcinomas to highly anaplastic carcinomas of histologic grade IV. This finding in cirrhotic livers is not rare. It should be considered in the same light that many regard the varying grades of neoplasia found in multiple polyps of the colon or the development of multicentric malignant neoplasms in other organs or sites on or in the body."

Discussion

Question: "What is the difference between the iron storage disease following multiple blood transfusions and hemochromatosis?"

Dr. Wells: "Extensive deposits of hemosiderin occur in the tissues of patients with a variety of diseases in which red blood cells are destroyed intravascularly. Many blood transfusions with or without the hemolytic diseases may be responsible for the same iron deposits in tissues. This has been called hemosiderosis and should be distinguished from hemochromatosis primarily because the basic abnormal physiology of the latter remains a mystery and secondarily because the iron deposits in the former are mostly in the reticuloendothelial cells of the body while in hemochromatosis the hemosiderin is predominately in the liver, pancreas, skin, adrenals, thyroid gland, intestinal tract epithelium and choroid plexus. In spite of these generalizations hemosiderosis can result in pigmentation of the skin, cirrhosis of the liver, and diabetes mellitus, all the result of excessive iron deposit.

"There seems to be a trend in the literature[5,14] to favor the theory that the basic abnormal physiology in hemochromatosis results in an excessive absorption of iron from the intestinal contents. Once absorbed the excess iron accumulates over many years eventually causing serious injury to the liver and pancreas.

"The rigid conservation of iron in the body after it is absorbed, so fundamental in normal iron metabolism may well become the 'accessory to the fact' in both hemochromatosis and hemosiderosis. This conclusion is accentuated by the fact that hemochromatosis is twenty times more frequent in men than in women and that when it does occur in women the average age is twenty years more than in men."

Question: "Is the cirrhosis the cause of the carcinoma of the liver?"

Dr. Wells: "Since the cirrhosis of hemochromatosis is associated with hepatoma in approximately 18.9 per cent of the cases,[7] there is a remarkably close relationship between the two conditions. The clinician should expect and look for evidences of hepatoma in any case of hemochromotosis. Incidentally, in a series of 1989 cases of portal cirrhosis reported by Berk and Liever,[1] hepatomata were present in 4.5 per cent. The more than four-fold greater frequency of carcinoma of the liver associated with portal cirrhosis over that occurring with hemochromatosis cirrhosis[7] is undoubtedly due to the greater incidence of portal cirrhosis."

Question: "What is the treatment of hemochromatosis?"

Dr. Flipse: "In closing, I would like to emphasize that the diagnosis of hemochromatosis is no longer only of academic interest inasmuch as rather specific therapy is suggested by the studies of Davis and Arrowsmith.[2] They believe that the gradual accumulation of iron in the body is caused by inability of the intestinal mucosa to reject ingested iron. Since the human has little or no capacity to excrete iron, it accumulates in the tissues, causes death of parenchymal cells and fibrous replacement. By the repeated removal of 500 ml. of blood by phlebotomy at a rate of 4 to 7 pints a month, separation and discarding of the red blood cells, and readministering the plasma, they were able to remove 15 to 20 gm. of iron per year from the human body. Such therapy in three patients resulted in symptomatic improvement, improvement in the diabetes and presence of less iron and less cirrhosis on biopsy in the post-treatment specimens than in tissue removed before the treatment."

CONTROL OF DISEASES

The control of diseases due to an insanitary environment can, obviously, often be accomplished in sudden and dramatic fashion. No such easy victories can be achieved with the contact-borne diseases, since man is much less susceptible to control than his surroundings. Such maladies as tuberculosis and syphilis have been fought almost as effectively but at a slower pace.—C. E. A. Winslow, The Cost of Sickness and the Price of Health, WHO Monograph Series, No. 7, 1951.

History of Medicine In Minnesota

NOTES ON THE HISTORY OF MEDICINE IN WASECA COUNTY PRIOR TO 1901

B. J. GALLAGHER, M.D., and J. F. LYNN, M.D.
Waseca, Minnesota

(Continued from the July issue)

L. D. McIntosh was born in Bethel, Vermont, probably about 1838. His mother was the sister of Dr. Muzzy, a noted physician and surgeon of his day in Boston. He had four brothers, one of whom died in infancy. The boys were all geniuses along some line. Ruben became a famous photographer, William propagated the well known McIntosh Red Apple, and Soloman made fine maple sugar and syrup that was known throughout the east for its quality.

Dr. McIntosh was a graduate of the Medical College of Castleton, Vermont, probably in 1860, and that year he married Miss Rebecca Preston, at Sheboygan, Wisconsin. He was Assistant Surgeon in the 47th Wisconsin Infantry for a time during the Civil War. He was very ill in Tennessee with typhoid fever. After the war, he returned to Wisconsin.

He was a dentist as well as a physician and while in Sheboygan, he practiced dentistry and carried on an office practice of medicine. In January, 1869, he moved to Waseca, Minnesota, which had been established about a year before. He was a brother-in-law of Dr. H. J. Young, the first physician in the City of Waseca, who also had come from Sheboygan in 1867. Dr. McIntosh was a born inventor and at one time, whether while still in Sheboygan or later in Waseca is not known, devised a uterine supporter for a patient. Later he sold the patent and that device is still on the market as the McIntosh Uterine Supporter. The man who bought the patent made a fortune on it.

In 1879, Dr. McIntosh and his family moved to Chicago and he went into a large firm, known as the "McIntosh Battery and Optical Company," manufacturing electrical appliances, principally projecting lanterns (stereopticon machines) and microscopes. These machines were used by many noted lecturers of that time, such as Burton Holmes and Stoddard. It is of interest to recall that in that year, 1879, Edison perfected the first incandescent light bulb.

Dr. McIntosh was not a strong man, physically, but very ambitious and a great worker. He was a very ardent temperance man and prohibitionist while in Waseca, and stood high in his profession. In Chicago, before his death he held a professorship, and was president of the Chicago Dental College, as well as a professor in electric therapeutics in the Chicago Postgraduate Clinic. He was appointed assistant superintendent of microscopy for the Chicago World Fair. In February, 1892, he went to a convention of doctors in Florida, to give a course of instruction at a Chautauqua and while there became ill and died, age 54, at De Funiah Springs, February 28, 1892.

Dr. and Mrs. McIntosh had two daughters, Lulu, now deceased, and Rebecca, now Mrs. Rebecca Thompson, living (1952) in Santa Barbara, California.

Dennis J. McMahon was born at Prior Lake, Minnesota, on March 28, 1866. He grew up there and later attended the University of Minnesota. He graduated from the College of Physicians and Surgeons at Keokuk, Iowa, in 1895. He first practiced at New Richmond, Wisconsin, from 1895 to 1897. He then moved to Waseca where he was in practice from 1897 until the fall of 1900. In 1899 he married Miss Katherine Mulcahey of the Waseca community and in 1900 he moved to Raymond, Minnesota, where he remained until 1918 when he located in Breckenridge, Minnesota. There he remained in active practice until 1937 when he retired. He died at Breckenridge on April 12, 1940.

Dr. and Mrs. McMahon had two children. A son, Leo H. McMahon, became a physician, graduated at the University of St. Louis and later practiced at Breckenridge. He died in 1944. A daughter, Mildred A. McMahon, graduated at the University of Minnesota and is now (1952) teaching social studies in the Balboa High School, Balboa, Canal Zone. Mrs. McMahon died at Breckenridge on December 18, 1945.

William Murphy was born in County Armagh, Ireland, on October 7, 1815. He came to America when he was 3 years old. His family settled in Pennsylvania and as a young man he became a homeopathic physician, graduating at the Hahnemann Medical College in Philadelphia, where he entered the practice of medicine. On September 4, 1842, he was married to Miss Sophia Fisk at Brighton, Ohio. One son was born to this marriage, John F. Murphy, in Philadelphia, on January 7, 1850. Dr. Murphy was a well known musician in Philadelphia and was pipe-organist in an Episcopal Church. His granddaughter, Miss Martha I. Murphy, still lives in Waseca and she has in her possession a little book called "Hamilton's Catechism of the Organ" which was autographed by Dr. Murphy in Philadelphia in 1850. Dr. Murphy's health began to fail a few years after that and the family moved to Minnesota in 1857, presumably because the climate was supposed to be good for "lung trouble." They arrived at the town of Wilton in December, 1857. It is not known that Dr. Murphy ever practiced there very much because he was in poor health, but it is known that at times he taught school in the Wilton Seminary, a private school that started in 1858, and closed for all time in April, 1861, the first month of the Civil War. He died at Wilton of tuberculosis on May 14, 1859. His son, John F. Murphy, who was nine years old when his father died, became a printer and later a publisher of the *Waseca Herald*. He lived to be an old man, nearly all his life in Waseca, and was always known as "Murphy the Printer."

John Nutting was born August 31, 1836, at Nuttingville, South Amherst, Massachusetts. In June, 1856, he was married to Eliza Ann White. His second marriage occurred in 1867 to Ann White. In 1882 he was married to Anabelle Beede who died in July, 1922. He had eight children, three of whom are still living (1951), Percy L. Nutting, Charles W. Nutting and Izma Da-Suess. His son, Percy L. Nutting, lives at 319 East Washington St., Mankato, Minnesota. It is not known where he graduated but he first appears in the lists of Waseca County at Alma City in 1886 and was licensed by examination. He is not listed in Waseca County in 1890 but in 1893 he was at St.Clair, Blue Earth County. By 1898, and probably for two or three years before, he was again in Waseca County, at New Richland, and is thought to have been in Alma City again from 1898 to 1901. Later he moved to Mankato where he died on October 16, 1912, and was buried at Oak Ridge Cemetery, Faribault, Minnesota.

J. J. O'Hara was born near Edinburgh, Scotland, in 1868. His father was a paper maker and moved to Ontario, Canada, when the future Dr. O'Hara was four years old. To earn money for a college course he worked in a paper mill, also studied telegraphy and later was a station agent for the Canadian Pacific Railroad in Northwestern Ontario. He graduated in medicine from Queen's University, Kingston, Ontario, Canada, in 1898 and came to Alma City, Minnesota, the same year. He heard of the need of a doctor at Alma City (five or six miles south of Janesville) through the Drs. Hector and Fred McDonald, also graduates of Queen's University. In 1904 he moved from Alma City to Janesville. At one or more times he was president of the Waseca County Medical Society and for a long time he was president of the Janesville Public Library Board. He was also active in Red Cross and other community work. He was a member of the Masonic Order, Royal Neighbors and Modern Woodmen. He was very active in the practice of medicine and extremely loyal to every cause he espoused. On September 11, 1901, he married Miss Lola Longmore of Ontaria, Canada. They had two sons. The elder, Bruce, became a druggist and died February 5, 1941, in Milwaukee, Wisconsin. The younger boy, Malcolm, became a dentist and after a few years of work for the government in CCC Camps and one or two years in private practice he joined the regular army Dental Corps. Early in World War Two he was assigned to service with Major Seagrave (Burma Surgeon) in Burma. There he did much medical and surgical work, as well as dental, and participated in the famous retreat of Major Seagrave and his outfit from Burma into India. He is now a Colonel in the regular army Dental Corps. Dr. O'Hara died of coronary thrombosis on July 6, 1931, at Janesville and is buried in the Janesville cemetery. Mrs. O'Hara is still living (1952) in Janesville.

Dr. Palmer. The *New Richland Star,* 50th Anniversary Edition in 1927, relates a story headed "Shot Down the First Doctor's Sign Here." It relates the story of four country boys who were hunting prairie chickens and came to see the first train arrive at the new Village of Richland, late in 1877. The only house in town sat on the site where the school now stands. The first physician, a Dr. Palmer, boarded there and had his sign out in the yard. The boys took turns shooting it full of holes while waiting for the train to arrive. Apparently Dr. Palmer did not stay very long as no further mention of him has been found.

Dr. R. Parkins. When Dr. Berrington left Wilton about April 1, 1874, Dr. Parkins succeeded him, but his card only appeared for two months, until June 1, 1874. It is thought that he moved to Minnesota Lake. By that time Wilton was fast becoming a "ghost" town.

F. C. Peck was the first or second doctor to come to Waseca, in the fall of 1867 when the village started. Apparently he did not stay very long and Dr. H. J. Young, who remained until 1898, is usually known as the first doctor to settle in Waseca. The first edition of a paper, the *Waseca News* (weekly) appeared on October 10, 1867. In the fourth issue, on November 1, 1867, Dr. Peck's professional card appears for the first time.

DR. F. C. PECK
Office over Smith's Store
Second Street, Waseca, Minn.

Dr. Young's card first appeared two weeks later in the November 15, 1867, issue:

H. J. YOUNG, M.D.
Physician & Surgeon
Inquire at the Drug Store or at the
Trowbridge Hotel, Waseca, Minn.

Dr. Peck's professional card appeared for the last time in the April 10, 1868, issue of the *Waseca News*. Then the May 8, 1868, issue of the same paper has the following news item:

> "Married, April 20, 1868, by Rev. W. Jones, Dr. F. C. Peck of Waseca, Minn., to Miss Belle Robinson of Mill Valley, Erie County, Penn. A friend of the Doc's wishes them 'pecks' of happiness and 'cribs' full of babies. To all of which we say 'so mote it be'."

No further mention is made of Dr. Peck. He may have returned to Pennsylvania to practice.

L. D. Pierce is known to have practiced in New Richland in the early 1880's. In 1886, 1890, and 1893 he is listed as practicing in Balaton, Lyon County. In 1896 he is not listed and nothing more has been learned about him.

Franklin T. Poehler graduated from the College of Medicine and Surgery, University of Minnesota, in 1896. He filed his certificate with the Clerk of Court in Waseca, June 17, 1896. Apparently he was in Waseca only a few months. In 1898 he is listed as practicing in Morristown, Rice County, and in 1900 he was in Minneapolis at 410 Syndicate Arcade.

William Davidson Rea is listed in old records as having graduated from the Hospital College of Medicine, Louisville, Kentucky, in 1888, and from the Minneapolis College of Physicians and Surgeons, Minneapolis, in 1898. Why the two graduations, we do not know, but in 1890 he was practicing in Indianapolis, Indiana, in 1893 in Louisville, Kentucky, in 1896 in Keokuk, Iowa, and again in 1898 in Louisville, Kentucky. His certificate to practice in Minnesota is dated June 16, 1898, and he filed it in Waseca County on July 8, 1899. We do not know in what town he practiced, if at all, and apparently not very long, because by 1900 he is known to have been practicing in Minneapolis at 329 Boston Block, at the corner of Hennepin and Third Street.

Charles I. Remington was born in Buffalo, New York, May 7, 1853, the son of C. W. and Mary Jane (Wright) Remington. After receiving a classical education in his youth, he commenced the study of medicine with Dr. E. J. Davis of Mankato in 1876. He then graduated at the Keokuk College of Physicians in 1879. In that year he started practice in Alma City. On February 14, 1882, he married Miss Lucy Clark who was born in Winona County in 1860. On December 18, 1882, a son, Everett C., was born. Dr. Remington's certificate to practice was issued January 16, 1884. In 1886, 1890 and 1893 lists he is still recorded as practicing in Alma City. Some time later he is said to have been in Marshall, Minnesota.

J. A. Reynolds graduated from the College of Physicians and Surgeons at Keokuk, Iowa, in 1884. His Minnesota license (835R) was issued March 11, 1884, and he located at Cleveland, in Le Sueur County. Later he is said to have practiced in Elysian (Le Sueur County). By the late 1890's and possibly as late as 1901, he was in New Richland, Waseca County. He is said to have been from Virginia and it is thought that he returned there after leaving New Richland.

Nathaniel Reuben Sackett, who was born on Dec. 8, 1825, in New York State and lived to be ninety-five years old, has been written up at greater length in the notes of the medical history of Olmsted County in MINNESOTA MEDICINE for June, 1951. He belonged to the regular school of medicine, receiving his education in New York State and beginning his practice in Syracuse. There he was married on August 11, 1854, to Julia A. Palmer. They came to Olmsted County, Minnesota, in May of 1855 and settled at Quincy Mills. From 1865 to 1868 he was in St. Charles, later for a shorter time in Chatfield. Then he was in Windom for some years. He came to Janesville probably about 1875 and was there until 1909 or 1910. He helped organize the Masonic Lodge in Janesville and he and his wife were members of the Methodist Church. They spent the last years of their lives at Lanesboro where Mrs. Sackett died on November 21, 1914, and Dr. Sackett on December 20, 1920.

Delos Dewitt Smith was born August 9, 1860, at Beaver Dam, Wisconsin, and came as a young boy to Minnesota. He attended Shattuck Military Academy at Faribault. He started his business career as a druggist in 1883 in Alma City. He was married to Miss Emma Shephard of that vicinity in 1885. In 1890 he graduated from the Missouri Medical College of St. Louis, and for the next ten years was a practicing physician at New Richland, Minnesota. He then attended Jefferson Medical College of Philadelphia for postgraduate work in eye, ear, nose and throat. Upon his graduation he returned to Mankato where he practiced for ten years, from 1900 to 1910. In 1910 he retired and left Mankato for San Diego, where he resided up to the time of his death on December 24, 1936.

Willis Leroy Sterns graduated from Rush Medical College, Chicago, in 1894. While he apparently did not file his certificate with the Clerk of Court, he did promptly file for the office of coroner on the Republican ticket, and was elected coroner in the fall of 1894. He is still listed as being in Waseca in 1896 but he did not again run for coroner. From 1898 to at least 1902, and probably longer, he is known to have been in practice at Mason City, Iowa.

Frederick Adelbert Swartwood was born at Cannon City, Rice County, Minnesota, December 8, 1860. He attended public schools, a four-year elective course at Carleton College and graduated in medicine at Ann Arbor in 1886. He married Ida M. Poe, November 20, 1886, and came to Waseca that fall where he practiced until his death forty-four years later. They had two children, Madeline, now Mrs. Mark Moore of Denver, and Harold, now of Chicago. He was the first president of the Waseca Savings and Loan Association, president of the Waseca Telephone Company, stockholder in the Armstrong Wholesale Company, mayor of Waseca for several terms, was a member of the Waseca School Board, president of the Waseca Commercial Club, postmaster under McKinley, Roosevelt and Taft, and surgeon for the Chicago Northwestern Railroad for many years. He was active in party politics, was temperate in his habits and capable of performing an immense amount of labor. He had a large clientele during his forty-four years of practice in Waseca. He was very instrumental in the starting of the Waseca Memorial Hospital in 1921. He died November 11, 1930, of heart trouble which had made it impossible for him to work for several months. Probably no doctor that ever practiced in Waseca had such a large and faithful following for so long a time as Doctor Swartwood.

Swartwood Family Lineage

1. Alexander Swartwood (Great Grandfather) came from Holland with two brothers. Settled in New Amsterdam, now New York. They prospered in the new Colony. When the Revolutionary War broke out the two brothers returned to Holland. Alexander elected to remain in America. He enlisted and fought in the Revolutionary War on the side of the American Colonies.
2. Henry Swartwood—son of Alexander (Grandfather) established his home in Pennsylvania, near Philadelphia. His vocation was agriculture.
3. Henry A. Swartwood—son of Henry (Father) came to Minnesota to pioneer in Territorial Days. He was born in 1836. Married Harriet Francis Shepard, born in 1837, was graduated from Mount Holyoke College, Mount Holyoke, Massachusetts. They were married in 1859 and established their home in Rice County, near Faribault, Minnesota, owning this farm during their lifetime.
4. Frederick Adelbert Swartwood—eldest son of Henry A., born December 8, 1860 on parents farm near Faribault. He attended rural school in Rice County, and Faribault high school. He graduated from Carleton College, Northfield, Minnesota, University of Michigan, Ann Arbor, School of Medicine 1886.

   Ida Mae Poe (wife), born January 12, 1861, at family home in Cherry Valley near Cannon Falls, Minnesota, was the daughter of William Estep Poe and Julia Shirpey Poe. The Poes came to Minnesota from Virginia, and Kentucky in Territorial Days. Ida Poe was educated in rural school in Goodhue County, Cannon Falls High School, Carleton College, Northfield, Minnesota, and Hamline University School of Music, Saint Paul, Minnesota. She was married to Dr. F. A. Swartwood November 20, 1886, and came directly to Waseca, where Dr. Swartwood was, for a short time, in partnership with Dr. Hunt. Establishing his own office in 1887 he practiced in Waseca until shortly before his death. He died on November 11, 1930. Mrs. Swartwood lived in the family home in Waseca until November 1943. She passed away in Saint Paul, Minnesota, on December 12, 1944.

Martin J. Taylor was born at Caledonia, Minnesota, on February 28, 1855. He graduated from the medical school at the University of Michigan in 1881. He came to Janesville, Minnesota, within a year or two and took over the practice of Dr. R. O. Craig, the pioneer physician of Janesville, who by that time had extensive business and political interests. In October, 1886, Dr. Taylor married Miss Stella I. Carpenter. They had one child, a daughter, Marvel, now Mrs. James E. Belden of Encino, California. During all the nearly thirty years of his life in Janesville he carried on a very extensive practice but always had time to give to every movement for the good of the community. At various times he served as mayor of Janesville, county coroner and president of the Waseca County Medical Society. What manner of man he was is well stated in the following tribute by a friend at the time of his death:

> "He was loved by young and old in the large territory he served. Night and day he was on call and never refused to go because of bad weather or the certainty that he would receive no pay for his services. He was very public spirited. It was he who started the library, the water system and the fire company, and who solicited the funds to paint the churches irrespective of denomination. He was a warm-hearted generous man, and no person in Janesville was more generally missed or more sincerely mourned at his passing than Dr. Martin J. Taylor."

His daughter, writing of her childhood days in Janesville, has said:

> "No matter how cold or how deep the snow or how dark the night, he would always start out with a very lively team with a bottle of home made wine and a sack of flour in the back of the cutter, for the people who needed them. No set of books was ever kept and he never dunned a man, let alone a widow. Many times he operated on a woman in childbirth on the kitchen table with husband holding the lamp only to have to lay the husband out on the floor in a complete faint, no one else to administer 'chloroform' except himself."

Dr. Taylor died in Janesville on July 3, 1910. He was buried with full Masonic honors in the Janesville Cemetery. Mrs. Taylor died in Los Angeles on April 3, 1936.

Dr. Henry J. Young is reputed to be the first physician to locate in the then Village of Waseca when it started in the fall of 1867, although Dr. F. C. Peck came about the same time. Dr. Young was born in Vermont, June 9, 1831. He studied medicine with Dr. E. A. Knight of Springfield, Vermont. After practicing for two years in Vermont and New Hampshire, he came west to Sheboygan, Wisconsin, where he practiced until 1862. He was then commissioned Assistant Surgeon in the First Wisconsin Cavalry and went to the front with that Regiment. In the fall of 1864 he was appointed surgeon to the 47th Wisconsin Infantry where he served until the Regiment was mustered out at the close of the Civil War. He was then placed in charge of the General Hospital at Tullahome, Tennessee, where he served until the hospital was closed. He then returned to practice in Sheboygan until the fall of 1867 when he came to Waseca. In January, 1855, he was married to Miss Lucy Preston of Sheboygan. They had two sons, Carl H. and John C. Young, neither of whom are now living. *Childs History* of Waseca County, published in 1904, says of him:

> "As a physician and medical adviser he had few superiors. He was kind and considerate of the poor, always ready and willing to aid the distressed, even though there was no hope of reward for his services."

In 1898, after thirty years or more in Waseca, he moved to Alabama where he remained about one year, then to Lebanon, Oregon, where he died at the age of sixty-nine years on April 23, 1900.

That the doctors did not always get along well with each other in the early days is evidenced by the following affidavits and statements that appeared in the August 9, 1871, issue of the *Waseca News*. Dr. Jacob Brubaker and Dr. Young apparently were bitter enemies and Dr. Brubaker seems to have accused Dr. Young of trying to steal his patients. Dr. Robert Addison, formerly an eminent English surgeon, was visiting in the neighborhood for a few weeks and seems to have seen some cases in consultation with the local doctors. He, too, jumped into the fight with both feet, on the side of Dr. Brubaker, as evidenced by Dr. Addison's signed statement which is not mild, coming from an Englishman who was merely visiting in the community.

The following week, August 16, 1871, the *Waseca News* contained Dr. Young's "Reply to the Public"—his rebuttal to Dr. Brubaker's inspired statements. If Dr. Brubaker had any skin left on his body after that, it must have been severely blistered.

From the *Waseca News* for August 9, 1871, page 3, column 5.

To The Public

The following statements will explain themselves to the reader.

STATEMENT OF JOHN FREDERICKS.

Sunday last Dr. Young, of Waseca, called at my house, and asked about my wife who had had her arm broken. I told him that since Drs. Brubaker and Addison had set her arm she had done well. He then wanted to see her. I agreed to let him go in her room if he would not put his hands on her. He then went in and looked at her, and said to my wife that her arm was all wrong and out of place. He then said Dr. Gove had directed him to see about the case, and tried to pursuade me to have him and Dr. Gove set the arm over. I told him no; that I did not want too many doctors, and that I was satisfied with the way my wife was getting along. Dr. Young then said that Dr. Brubaker was a poor hand to manage such a case, that about eight weeks ago he set the elbow of a Norwegian, Ole Hansen; that it was poor work and not set at all, that a few days ago it took him (Dr. Young) and three other doctors all day to get it in place; and that any doctor who would manage a case as Dr. Brubaker did the Norwegian's elbow, was not a safe person to manage my wife's case or that of any one who was hurt.

John Fredericks.

County of Waseca, ss:

John Frederick being duly sworn says that the foregoing statement is his, signed by him, and that the same is true.

Subscribed and sworn to before me this 4th day of August, A.D. 1871.

H. P. Norton
Notary Public.

(Seal)

Statement of Peter Oleson Gjerde.

Ole Hansen stopped at my house when he hurt his elbow. My brother Charles went for Dr. Young, and I was present when he attended to him.

Peter Oleson Gjerde.

Peter Oleson Gjerde being duly sworn says that the above statement signed by him is true.

Dated, subscribed and sworn to before me this 5th day of August, A.D. 1871.

E. Cronkhite,
County Auditor

(Seal)

Statement of Doctor Addison

Waseca, August 5th, 1871

I hereby certify that about a fortnight ago I was invited by Dr. Young to meet him in consultation, with Drs. Gove and McIntosh, on the case of Ole Hansen with a dislocated elbow. He then informed me that about five weeks before the man had applied to him and that he had reduced the dislocation, and that some little time after he had left the county and had got to St. Peter and finding the limb out of joint he there obtained the help of some surgeons who did not succeed in reducing it. He then returned to Waseca where the operation was completed by the above named surgeons.

I further certify that I was present with Dr. Brubaker when he attended to the broken arm of Mrs. Frederick, and that his management of the case, was, in my opinion, strictly correct and judicious and fully merited the commendations and confidence of the patient and her husband.

I lament exceedingly to be compelled to animadvert upon the conduct of Dr. Young in these two cases, but must declare that in the whole course of my forty-five years practice, I never met with or heard of more despicable proceedings to obtain a patient, and could not have conceived it possible that a member of his noble profession could have descended to such falsehood and meanness.

Robert Addison, M.D.

Member of the Royal College of Surgeons, Licentiate of Apothecaries Hall, London and Edinburgh and Fellow of the Rhode Island State Medical Society.

I deem no apology necessary for making a statement of my relations to the above cases. One week previous to last Wednesday evening I was called to visit Mrs. John Fredericks, whom I found with a partially dislocated shoulder and a fracture of the arm bone near the shoulder joint. I requested assistance and was directed to bring Dr. Addison, who accompanied me the next morning. On last Tuesday morning I received an urgent message to visit the same patient. On my arrival the Rev. Father Baumen was ministering to her spiritual wants, and on entering the room I found her very much frightened, her first remark being "Doctor, I know I must die." She then stated that she had rested well Thursday, Friday and Saturday, but on Sunday became distressed, which condition was followed by fever, a hard chill and loss of sleep. After examining her case I assured her that everything was favorable, administered an anodyne, and she became reconciled; since which time her case has progressed favorably, considering her serious injury and the extreme heat of the last few days.

I will also state that Dr. Young in going to Mr. Frederick's without being sent for did an act that would disgrace any member of the medical profession; and in intruding himself at Mrs. Frederick's bedside and endangering her safety by false alarms, he resorted to little less than criminal means, with a view to secure her as his patient, and in telling Mr. Fredericks that I reduced the dislocated elbow of Ole Hansen, that it was "poor work and not set at all," using it as an argument with which to steal a patient, he practiced a scoundrel's audacity. The foregoing statements show who did that "poor work"—that it was Young; and for saying that I did it I brand him the author of an unmitigated falsehood.

August 5th, 1871

J. C. BRUBAKER, M.D.

From the *Waseca News* for August 16, 1871. Page 3, column 5.

Reply "To The Public"

Sunday, July 30th, I called at John Frederick's, met him at the door, asked for a drink of water, got it, walked into the room where his wife lay, remarking at the same time, "your wife has her arm broken." He replied "yes, it is fixed now. Dr. Brubaker was here Wednesday night, could not fix it, told me to keep cold water on it, he would bring another doctor in the morning. Dr. Addison came in the morning, took hold of it and set it easy." Mr. Fredericks said "wasn't it too bad my wife lay all night without her arm being set?" He said further, "my wife suffered much pain last night, very much pain—she feel very bad sick."

He asked me to look at it. He raised her up in bed, and I did look at it. I told him it was not quite in place, that the dressings were not good, and that they were heavy, pulling down on her shoulder. I told him it needed attending to—to get Dr. Addison to come and see it again, and get him to see that it was in place and that those dressings were removed and proper appropriate dressings were applied. If he could not get Dr. Addison, to get Dr. Gove. I offered to let Dr. A. have some splints and good dressings for the case; for he being here only temporarily, had no surgical applicances with him. I told him I would not let Brubaker have them for he would not know how to apply them.

I told him I had had a conversation with Dr. Gove in the morning about calling—he felt anxious to know if the arm was all right. I told Dr. Gove I would call and see. If there had been no Doctor there but Brubaker, it would be very sure to be wrong. I also told Fredericks that Brubaker was not, in my opinion, competent to manage any case where it required surgical skill—no more so, I said, than any man outside the medical profession with ordinary judgment; and I brought up several cases as examples of his poor work, and these were the cases I mentioned: Jerome Madden, Mr. Kinney's boy, Mr. Dunn, Mr. Fanning's boy, Mr. James. I also said we had a case no longer ago than last Tuesday, where the arm had been out six weeks, and we had a severe time breaking it over and getting the arm in good shape. This man's name, I told him was Ole Hanson. I advised him to have his wife's arm attended to at once. I told him that Dr. Addison was an old English surgeon, of great ability and skill; that I was sure of—and if he could not get him there within eight days from the time the arm was first set and take the responsibility of seeing that it was all right, to be sure and get Dr. Gove and not neglect it. He said if he could get Dr. Gove he was a good man as he wanted, that he wanted him in the first place. I will say here that Mrs. F.'s pulse was running about 120 when I called and she seemed very feverish, breathed very rapidly; the dressing was heavy, badly out of place and irritating. If I can get Mrs. Fredericks to consent, I will have a photograph of the dressing in the same position I then saw it.

In going to the bed side of Mrs. F. I did not commit any crime, but in leaving her in that suffering condition, her arm burdened with those rough, heavy splints pulling down on her weak, inflamed shoulder, partially out of joint then, and the muscles trembling and quivering like any limb out of joint, I did neglect a humane duty which I shall not be guilty of again soon.

Mr. Fredericks and his wife were both willing to receive relief from any source. With regard to my intruding myself in this case in order to obtain a patient, I will say that while I am making the practice of medicine and surgery my business I shall endeavor at all times and under all circumstances to relieve human suffering in all its forms to the extent of my ability —it matters not to me whether it be Dr. Brubaker's patient or whose patient it is. It matters not to me what name Dr. Brubaker calls these acts, but I have already repaired several of these poor jobs, free of charge, and I would not pass by a dog or a horse with a broken limb, without trying to relieve him.

And now, Jake, let us turn the allusion to crime. Did you commit a crime when you went into that speculum operation, in Wilton, for which you barely escaped what every one would say you justly deserved—the penitentiary? You either committed a great crime or else displayed more than your usual amount of ignorance. It was the opinion of physicians at Faribault, Northfield, Austin, at the Asylum and also at this office, where she was finally relieved, that you drugged Mrs. Eckert into that deplorable condition of mind that she was in for one and a half or two years.

You were cutting around here with an old gum lance, sawing little innocent babes' gums, from two months old upwards, until people did get disgusted with it. That was not all you did to those little innocents. While the gums were open and bleeding, you administered calomel to them sometimes in large and sometimes in small doses, under the head of some simple remedy.

This may seem incredible to many unsuspecting mothers. I will prove it to any one beyond the least shadow of a doubt—to some of you in the visible effects of the drug now—to others in a black and white record. The effects of calomel when taken into the stomach are to salivate, produce mercurial rheumatism, ulcers in the mouth, etc. When taken directly into the circulation through the open gums the effects are a hundred fold more disastrous, producing stiffness of the muscles of the neck and all its deplorable effects in a more aggravated form. Jake, I have known of your administering calomel to children who were but little sick, until you got up an aggravated form of mercurial disease and then you would begin to swab their throats and pitch into the new feature of the disease, remarking, with that Ethiopian Ivory expression of the eye "We Doctors can not always tell what pathological changes may take place." Why didn't you acknowledge the "corn" to Mr. Collins near Wilton, when you found you had got a disease easily cured with sulphur instead of small-pox, which you alleged it to be; or did you think you were fully chastised in getting that severe cold changing your apparel in that cold barn, when you got back to town? How much money did you say you made vaccinating that time?

Were you joking when you got a surgeon to come with great dispatch to meet you and operate for inguinal hernia on Mrs. Henry Shultz? When the surgeon came he informed you and the friends that there was no need of an operation—nothing there except what nature put there—a little paragoric and ginger tea will probably right the case and save further pain and expense.

Tell where that fellow is that was bumming around here with you two years ago who was introduced to your patients and mine, as State Medical examiner. Said he had examined all the Drs. here, found none competent but Brubaker. Pelsey. I suppose, though, he meant competent to drink as much whiskey as he could. Who created that office, who abolished it?

Jake, try and say some pleasant thing in your next communication. Tell how you enjoyed yourself at the picnic, south of Wilton that hot Sunday.

Tell us how that turn of the wrist is made—or, perchance, how you took a young lady to a ball and then she chose to stay with her friends, rather than trouble you to carry her home.

Say something funny; don't be engrossed all the time with calomel, turpentine and creosote.

H. J. Young, M.D.

(To be continued)

But nothing further on the subject ever appeared in the paper. Maybe the doctors settled their differences in a smoke-filled room or possibly the editors decided that it was "time for a change."

President's Letter

A PLATFORM PLANK

One of the strongest planks in the recently adopted Republican party platform is that on health insurance. The wording is firm and the meaning is clearly based on time-honored tenets. It states:

"We recognize that the health of our people as well as their proper medical care cannot be maintained if subject to federal bureaucratic dictation. There should be a just division of responsibility between government, the physician, the voluntary hospital, and voluntary health insurance. We are opposed to federal compulsory health insurance with its crushing cost, wasteful inefficiency, bureaucratic dead weight, and debased standards of medical care. We shall support those health activities by government which stimulate the development of adequate hospital services without federal interference in local administration. We favor support of scientific research. We pledge our continuous encouragement of improved methods of assuring health protection."

There are individuals who believe that a party platform is a mere formality—that it is a general statement not intended to be lived up to, but meant only to win friends and influence voters. However, there is a certain measure of assurance in a formal statement of views of a large party. A pledge has been made, and high-principled men will strive to keep it.

The medical profession can accept this statement on health insurance as a strong plank in the platform. As the ebb and flow of political tides progress in the next few months, its plank can be used by the profession to judge intelligently the principles of party standard-bearers.

Those who wish to keep American medical care from the greedy grasp of government, can hope that the plank proves not only to be temporarily strong, but that it will endure as a concept that embodies some of the finest of American principles.

ACCIDENT AND HEALTH INSURANCE

Each year the Health Insurance Council makes an annual survey* of the accident and health insurance coverage in the United States. This council consists of nine associations in the insurance business, which in turn are made up of companies writing health coverages. The report is intended to provide information for medical groups and hospital administrations about health and accident insurance and this particular report provides figures of interest to physicians.

Up to the late 1930's most health and accident insurance was of the weekly indemnity type. Hospital insurance got its impetus about twenty years ago from the organization of the Blue Cross, and the growth of hospital insurance the past ten years has been phenomenal. Voluntary hospital insurance last year covered 86 million persons. It is perhaps not generally appreciated that insurance companies, by means of group and individual policies, provide for 44 million or over half of this total, whereas Blue Cross and plans sponsored by medical societies cover about 41 million.

Insurance against surgical care got a later start than hospital insurance. Nevertheless the growth of this type of insurance has been just as phenomenal, until today about 65 million individuals are protected against the need for surgical care. Group and individual policies carried by insurance companies total 43 million whereas Blue Shield protects about 24 million against this hazard.

Insurance against medical expenses has been more difficult to institute. Many insurance companies and organizations sponsored by individual societies have lost heavily by carrying this type of insurance. Restricted policies, however, are available, and about 12 million individuals are now protected by private companies and 14 million by Blue Shield. The total of 27,723,000 now covered represents a 28 per cent increase over the 21,589,000 covered at the end of the year 1950.

These figures all refer to voluntary hospital, surgical and medical care insurance. In addition, 39,702,000 of the 61,000,000 employed civilians are protected by voluntary insurance against loss of income due to disability. This protection is largely for off-the-job protection and three-fourths of it is written by insurance companies. Workman's Compensation cares for most of the on-the-job income loss.

To illustrate the growth of voluntary health and accident insurance, some 9 million additional individuals were added in 1951 to the list of those protected by hospital insurance; about 9 million to those carrying surgical risk insurance; and 6 million to those carrying medical care insurance.

From these figures are omitted those covered by Workmen's Compensation laws; total and permanent disability benefits included in many life insurance policies; 4,800,000 commercial accident policies providing disability indemnity for injuries; 9,500,000 group accidental death and dismemberment insurance policies; commercial accident policies covering travel hazards numbering 8,000,000; complete medical care for the armed forces and persons in public institutions, and medical care and pensions for war veterans.

It would seem that the American people are health-insurance-minded, have realized the advisability and almost necessity of carrying insurance against the cost of sickness and accidents, and prefer to carry their own insurance instead of adopting compulsory government insurance. It will be most interesting to observe the growth of this type of insurance in the future years and just what percentage of the population ultimately will be covered.

POLITICO-MEDICAL PROBLEMS

The speech* of the retiring president of the AMA, Dr. J. W. Cline, at the annual meeting held in Chicago in June gives a bird's eye view of what has transpired of national import medically, the past year. All members of the Association would do well to read it.

---

*J.A.M.A. 149:853 (June 28) 1952.

The trend during the past year has been towards better medical care and an increase in the ratio of physicians to population. Interest in general practice and also in rural practice has been fostered, not only by the profession and the medical schools, but by the efforts of those in communities in need of physicians. This has resulted in more physicians locating in rural districts. These efforts should be increased.

He mentions the further growth of private insurance against hospital and medical care and emphasizes that more must be done to provide protection for the rural population. We might also add for insurance against chronic illness. He pleads for wholehearted support of such insurance by the profession, for such protection stands as a barrier against political medicine. The public and the hospitals, too, must co-operate.

Hospital costs have continued to increase, in keeping with the general inflationary spiral. This is to be expected, as sixty-five per cent of hospital costs is attributable to salaries and wages, and food costs are up.

Outstanding in the past five years has been the change in the position of the physician in the community. Instead of being an ideal whipping boy for any political demagogue, the profession has grown in strength, so as to be an unwise object of attack. The national educational campaign conducted so successfully by Clem Whittier and Leone Baxter is given credit for much of this change.

The attitude of the AMA in opposition to Federal Aid to medical education is emphasized. Federal Aid means Federal dictation and we want none of it. The American Medical Education Foundation supported by the profession and the National Fund for Medical Education backed by those who oppose Federal dictation in medical training will, it is hoped, solve the problem for the privately endowed medical schools, whereas the states should be able to support their own state universities and medical schools.

President Cline deals with the appointment of the Commission on Health Needs of the Nation by President Truman. There is good reason to believe that this commission was appointed with a time limit of a year, in order to keep the subject of health out of the political platforms. This it did not accomplish, for the Republican platform came out strongly in opposition to Federal Compulsory Health Insurance "with its crushing cost, wasteful inefficiency, bureaucratic dead weight and debased standards of medical care." It also declared that education is a local and state responsibility and not a Federal one. The Democratic platform, however, came out for private and public support of medical research, Federal aid for medical education, continued Federal aid for hospital construction, increased Federal aid for public health, especially in rural areas, and a commendation of President Truman for establishing a non-partisan commission to study and report on the health needs of the nation.

President Cline's address clearly defines the political issues affecting medicine today. The inaugural address of the new president, Dr. Louis H. Bauer, which was broadcast to the nation, indicated that the physicians of the country will continue the fight not only for the freedom of medical practice, but for the freedom of their fellow citizens against the inroads of socialism. They will also continue to concern themselves with politics, which is the duty of all Americans—doctors included.

PHYSICIANS, PHARMACISTS AND PRESCRIPTIONS

UNDER the Medical Economics department of this issue of the journal appears in some detail the requirements of the new prescription law, known as the Durham-Humphrey Act, which became effective April 26, 1952—six months from its passage by Congress.

According to the new law, drug manufacturers are required to label a drug as dangerous, which "because of its toxicity or other potentiality for harmful effect or the method of its use, or the collateral measures necessary to its use, is not safe for use except under the supervision of a practitioner licensed by law to administer such drug" with the label "Caution—Federal Law prohibits dispensing without prescription." The pharmacist is required to have a prescription, written or given over the telephone for the dispensing of a drug so labelled. Such a prescription cannot be refilled without a prescription, written or given over the telephone, by the physician. This is necessary and reasonable to prevent the patient from directing his own medication, possibly to his detriment. It means more work for the pharmacist in locating the prescribing physician. This only too often cannot be done promptly, and the patient waiting for the refill is likely to become irritated and demand that he receive his medicine and that the pharmacist obtain the physician's authorization if and when he can locate him. We mention the pharmacist's role in the matter of refilling prescriptions in order to promote understanding on the part of the prescribing physician who has only the inconvenience of answering a telephone call. These calls can, by the way, be minimized by writing on the original prescription: N.R. (non repetitive), or "may be refilled two (or three) times."

When it comes to the prescribing of narcotics, a prescription must be provided the pharmacist before the prescription is released to the patient. No telephone authorization for originals or refills is permitted, except that in case of an emergency a physician may telephone the prescription to the pharmacist, who may prepare it and deliver it upon receipt of the written prescription.

The insistence on the written prescription before delivery of narcotics may seem overcautious to the average physician, who as a rule has little to do with narcotic addicts. His point of view is doubtless quite different from that of the government narcotic agent and possibly from that of the pharmacist. The ruses perpetrated by addicts are notoriously clever.

In any event, the druggist is no more responsible for narcotic regulations than are the physicians. The new law is clear, and it is incumbent on physicians to co-operate to the fullest with the pharmacists in carrying out the regulations adopted in the interest of the public.

THE FATEFUL TWENTY-THIRD

We, the profession, caught as we are in a cleft stick, will watch the electioneering of the three main political parties and the results of their labours with mixed feelings. As citizens we are, for the most part, in that category known as the "middle-class vote" and as such are generally suspect. Each party will try to woo us on that score, with mild words but a shrewd heart. Should we think at all—which is most improbable, come the time of year—then we must balance all we hear against our traditional upbringing, and vote whichever way our thinking mind suggests. But as members of a once-noble and respected profession we are up against it: for all parties are pledged to maintain the social services; and that means, in greater or lesser degree, each of us. So on this we must all think as carefully as upon the civic score. Admittedly, the total voting proportion of the profession in relation to the whole community is small—approximately 0.2 per cent—but by virtue of our peculiar privilege we are able to sway, and in a subtle way, a greater proportion of other citizens than is the case of many individuals. Yet the question of the merit of a national health service is immediately divisable, from the professional point of view, into two most important sub-headings. First—the rather more altruistic in character—has the individual patient benefited from the recent extension of cover? and, second, has its introduction helped us as doctors to be better doctors?

If we search our hearts, what are we to answer to these two interdependent questions? Under the old scheme the middle classes were the ones who found illness such a financial burden, but they were proud of their achievements; the richer and the poorer could so easily get the best, either by paying handsomely or through voluntary service, financial and professional. And it was in such a system that the doctor held a position of trust and respect that was more precious than any financial reward. And now? The poor middle class is still the middleman. The rich can continue as they were wont; the poor are no longer so poor and can now get their demands fulfilled under threat of penalty to the doctor. The middleman cannot afford financially to pay twice over, nor can he afford in many cases the necessary time off to queue in surgery or hospital to receive the benefit of the National Health Service. But when we search our professional conscience, another question may rise from its dullness: are we giving better service to the community than before? And the answer?—unhappily, as yet, none has had courage enough to say that at heart many of us have an ugly feeling that the patient is worse off, for we have lost through bitterness or shear materialism or slanderous accusation that fundamental sense of respect and responsibility which made our calling what it was. So, ere we cast our vote in this election, let us pause awhile and think: if we can but think, then at least that will be a small ray of sunshine upon our otherwise ominously black horizon. The profession is in danger of being swept, by crude bureaucracy alone, into a maelstrom of swirling waters which can only spell absolute destruction to all its traditional best.—Editorial, *Medicine Illustrated,* February, 1950.

Note: The above editorial so well expresses the tragic result of socialization of the medical profession in Britain and the hopelessness as far as any remedial measures are concerned that it is being reproduced. It confirms the opinion generally accepted that medical care in Britain has deteriorated and the profession has lost its self-esteem and the respect of the public as a result of its socialization. To prevent such an outcome in our country, the medical profession has been exerting its best energies and will continue to do so.

There are certain diseases which notoriously increase the incidence of tuberculosis, diabetes mellitus and stenosis of the pulmonary valve of the heart, for instance. Whether diabetes acts by reducing the general resistance or whether the added sugar in the blood favors the growth of tubercle bacilli is a moot question. Stenosis of the pulmonary valve presumably acts by reducing the blood supply to the lungs and reducing local resistance. —George Blumer, M.D., Conn. State Med. J., May, 1952.

PRESCRIPTION LAW REQUIREMENTS EXPLAINED

The words, "Caution: Federal law prohibits dispensing without a prescription," while directed to pharmacists, are now, more than ever, vitally important to the physician as well.

The Durham-Humphrey Act, governing the refilling of certain prescriptions, became effective on April 26, 1952. The importance of co-operation between physicians and pharmacists in making the letter of this law entirely effective cannot be overemphasized. The protection of the public is foremost, and compliance with the law in all respects is essential.

In general, the law now provides that whenever a drug or medicine carries the above words, the pharmacist must have the prescribing physician's authorization before it can be refilled. The doctor may delegate this authority to an employe for a prescription refill, or he may state on each prescription the number of times he wishes to have it refilled.

The Laws Says—

The letter of the law provides that such drugs or medicines carrying that inscription be dispensed only on:

1. A written prescription giving the date, name and address of the patient, item and quantity of drug prescribed, directions for use, and the legal signature of the prescriber.
2. A telephoned order directly to the pharmacist by the physician or by an authorized employe, giving the same information as specified above in (1).
3. Refills are permitted only when authorized orally or in writing by the physician or by an authorized employe. Physicians may also authorize refills by indicating on the original prescription the number of times the prescription may be refilled.

A majority of prescriptions written today carry this legend, and include such drugs and medicines as antibiotics, sulfa drugs, thyroid, benzedrine, dexedrine, amphetamines, stilbestrols, estrogens, and antihistamines.

State Laws Correspond

Corresponding laws in Minnesota covering barbiturates and narcotics outline conditions under which prescriptions for these drugs may be filled.

All prescriptions for or containing barbital and any derivative must be written in ink or typewritten, contain the name and address of the person for whose use it is intended, must state the item and quantity of the drug, full directions for use, the date, and signature of the prescriber. *No* barbiturate prescriptions can be refilled except with the written or verbal consent of the prescriber.

All prescriptions for narcotics must be in writing only; no oral or phone prescriptions are permitted. Prescriptions cannot be refilled. Prescriptions must contain the patient's name and address, item and quantity of drug prescribed, the prescriber's name, address, registration number and signature. The only exception to this is any codeine preparation containing not more than one gr. of codeine per ounce.

The federal Bureau of Narcotics regulation on narcotics says:

> "The furnishing of narcotics pursuant to telephone advice of practitioners is prohibited, whether prescriptions covering such orders are subsequently received or not, except that in an emergency a druggist may deliver narcotics through his employe or responsible agent pursuant to a telephone order, provided the employe or agent is supplied with a properly prepared prescription before delivery is made, which prescription shall be turned over to the druggist and filed by him as required by law."

Under the Durham-Humphrey act, the pharmacist is legally bound to observe all of its provisions. This, naturally, will entail many additional phone calls to doctors' offices. This extra burden on the doctor is a necessary one. In aiding the pharmacist to comply with the law, it is vital that physicians co-operate fully with them. Less trouble and confusion will result, as well as the realization of the important part played in protecting the public against the flagrant and indiscriminate use of the drug and medicine prescription and its refilling.

SURVEY SHOWS FLAWS IN FEDERAL HEALTH INSURANCE

Outlining four major objections to any federal compulsory health insurance proposal, a recent survey in the *Quarterly Journal of Economics* at Harvard university listed those drawbacks to be:

"1. The government should not compel people to spend money on any particular service unless that service cannot be obtained in any other way or unless the government can provide the service more efficiently than private enterprise.

"2. Costs are too high.

"3. The quality of medical care deteriorates under a compulsory insurance scheme.

"4. Doctors will not accept it."

Insurance Now Available

Regarding the first point, the authors, economists Rita Ricardo Campbell and W. Glen Campbell, state that at present those who want health insurance can buy it as they buy any other goods or service. Voluntary health insurance plans are available to the average citizen at a cost no greater than what it would be under a compulsory, government-run system. The survey notes that Dr. Dean A. Clark, in his research report to the Senate subcommittee on health, estimated that "75 million persons were protected in full or in part by voluntary insurance against the costs of medical and hospital care. There can be no question of the fact that the voluntary insurance plans are expanding in areas where there is a demand and a need for them, it is added."

Costs Increase

On the second point, involving costs of a compulsory plan, the article points out that the experiences of all countries which have adopted this form of health insurance show that the costs of medical care increase greatly. Quoting several estimates, the authors observe, "It would be interesting to know how large a percentage of the population would favor compulsory health insurance if they were told it would cost them a payroll deduction of from 6 to 8 per cent."

Quality Drop Reported

A drop in the present high quality of medical care would be part of the proposed compulsory health insurance scheme. The study indicates that the great increase in demand for medical attention strains existing personnel and facilities and leads to some deterioration in services rendered. The report states: "Doctors' offices become crowded with patients who are forced to wait, often many hours, to be examined. The time and thoroughness devoted to each case must be reduced."

U. S. PHYSICIAN COUNT REACHES ALL-TIME HIGH

The total number of physicians in the United States has reached an all-time high of 211,680 as of the end of 1951. The annual licensure report of the American Medical Association notes that this represented a net increase of 2,640 doctors during 1951.

In 1951 there were 6,282 persons who for the first time, obtained licenses to practice in the United States. The net gain of 2,640 for the year was after an estimate of the number of deaths of physicians based on reports to the American Medical Association.

New York Leads

The report showed that New York had the greatest number of first-time licentiates with 743; California was second with 526. Next in order were Illinois, 437; Ohio, 394; and Pennsylvania, 388. Increases in the number of first-time licentiates, as compared with 1950 figures, occurred in twenty-six states.

Directional Moves Shown

The report reveals the general trend in locations of doctors throughout the nation. California issued the greatest number of licenses, 1,367. The report states: "Of these, 844 represented licensures by reciprocity or endorsement of credentials, including 216 to candidates who held certificates of the National Board of Medical Examiners. Illinois provided California with the largest number of doctors under state reciprocal licenses, 95; Minnesota was second with 53. California state board examinations resulted in 523 licenses."

Training Rated High

The report indicated the high medical training rating of the medical schools of the United States, all seventy-two of which are now approved by the American Medical Association's Council on Medical Education and Hospitals. Of 5,018 graduates of existing United States schools who last year took written examinations for licenses, 4,874, or 97.1 per cent, passed. Rates for other schools were considerably lower. Other schools include Canadian schools, extinct approved schools, foreign schools, unapproved schools and schools of osteopathy. Altogether, 6,473 persons took state board examinations; 5,716, or 88.3 per cent, received passing grades.

This notable increase in total number of physicians in the United States could hardly be a better answer to those who still advocate government-controlled medicine. Their arguments have been based on the contention that there has been and still is a tragic doctor shortage in America. Concrete action and constant improvement over the years has come largely from the efforts of the medical profession itself. With this larger figure comes assurance to Americans that medical care and service will be even better in the future than the high quality of the past and present.

THE MINNESOTA STATE BOARD OF MEDICAL EXAMINERS

230 Lowry Medical Arts Building
Saint Paul 2, Minnesota

Julian F. DuBois, M.D., Secretary

MEDICAL LICENSE OF ANOKA PHYSICIAN REVOKED

Re. John J. Stratte, M.D.

On July 18, 1952, the Minnesota State Board of Medical Examiners revoked the medical license formerly held by John J. Stratte, M.D., Anoka, Minnesota. Dr. Stratte, thirty-nine years of age, was before the Medical Board on several occasions in connection with disciplinary proceedings. The last citation was issued on April 15, 1950, and charged Dr. Stratte with habitually and excessively indulging in the use of alcoholic liquors and other detailed and specified violations of law. Dr. Stratte was given a hearing on that citation on July 14, 1950, and was placed on probation upon condition that he abstain, in every manner, from the use of alcoholic liquors and beverages. Dr. Stratte repeatedly violated the stipulation entered into by him in writing with the Minnesota State Board of Medical Examiners, and as a result, Dr. Stratte was notified to appear before the Medical Board on July 18, 1952. Dr. Stratte failed to appear and testimony was taken concerning Dr. Stratte's misconduct as a physician, with the result that his license was revoked for immoral, dishonorable and unprofessional conduct as defined by law.

Dr. Stratte was born at Dawson, Minnesota, in 1913, and received a medical degree from Rush Medical College in 1942. He was licensed in Minnesota by examination in 1943.

PRACTICAL ASPECTS OF THE Rh FACTOR

(Continued from Page 731)

the possibility of bearing a living child who can be saved by proper treatment.

Tubal ligation may be permitted women in their late thirties. In young women tubal ligation is inadvisable because of the possibility of remarriage to an Rh-negative man, and because it is always possible that some means of combatting the action of antibodies will be discovered while the patient is still young enough to have children.

Summary

The Rh status of every recipient should be determined prior to a blood transfusion and Rh-negative individuals should be given Rh-negative blood.

Antibody determinations should be made on all Rh-negative women as early in pregnancy as possible. Antibodies present in the first trimester usually produce erythroblastosis in the infant. In general, the higher the titer, the poorer the prognosis. Antibodies appearing for the first time in the third trimester of pregnancy are rarely responsible for more than a very mild form of the disease.

Rh immunization is permanent, and at present there is no known way of preventing maternal antibodies from destroying fetal blood cells.

The preferred treatment of an infant with erythroblastosis consists of replacement transfusion, repeated as often as necessary.

Minnesota State Medical Association

HOUSE OF DELEGATES—SUMMARY OF PROCEEDINGS*

Minneapolis Session—May 26, May 27 and May 28, 1952

First Meeting, Sunday, May 25, 1952

Gold Room, Hotel Radisson
Minneapolis, Minnesota

The Ninety-ninth Annual Session of the House of Delegates of the Minnesota State Medical Association was held in the Gold Room, Hotel Radisson, Minneapolis, Minnesota, beginning at 2 p.m., Dr. C. G. Sheppard, Hutchinson, Speaker, presiding.

After calling the meeting to order, and House acceptance of the minutes of the 1951 session, Dr. Sheppard introduced Dr. R. L. J. Kennedy, Rochester, president of the Association and Dr. A. H. Heidner, president of the State Medical Society of Wisconsin, who spoke briefly to the House of Delegates. Other introduced guests included Dr. R. G. Arveson, Chairman of the Council of the State Medical Society of Wisconsin; Dr. V. E. Ekblad, a councilor from Wisconsin; Mr. Charles Crownhart, Executive Secretary of the State Medical Society of Wisconsin and his assistant, Mr. Roy Ragatz.

Dr. John M. Waugh, Rochester, presented the report of the Finance Committee. Noting the accumulating operating deficit, caused mainly by a decrease in paid memberships, Dr. Waugh's committee recommended to the House of Delegates that a $10 special assessment be levied on every active member of the Association, with the view toward eventually raising annual dues to $40. The House accepted the Finance Committee's report.

Report of the Council

Dr. Sheppard then called on Dr. O. J. Campbell, chairman of the Council, to present the report of the first meeting.

Dr. Campbell: The first meeting of the Council in connection with the Ninety-ninth Annual Meeting of the Minnesota State Medical Association was held on Saturday, May 24, 1952, at 2 p.m. in the Hotel Radisson. . . . Dr. J. M. Waugh, chairman of the Finance Committee made his financial report to the Council.

. . . the following applications for Temporary Affiliate Memberships were approved: Dr. Nicholas I. Ardan, Jr., Rochester; Dr. Clair F. Benoit, Rochester; Dr. N. H. Chiles, Rochester; Dr. Vernon L. Cofer, Jr., Rochester; Dr. James J. Crumbley, Jr., Rochester; Dr. Jack Dunn, Jr., Rochester; Dr. Frank G. Gatchell, Rochester; Dr. Robert C. Green, Jr., Rochester; Dr. Harold C. Habein, Jr., Rochester; Dr. Robert E. Hansen, Rochester; Dr. Prescott B. Holt, Rochester, Dr. Richard L. Jackson, Rochester; Dr. Ralph A. Kilby, Rochester; Dr. Harry G. Kroll, Rochester; Dr. Joseph J. Kurtin, Blooming Prairie; Dr. Henry J. Kurtin, Blooming Prairie; Dr. Richard J. Lescoe, Rochester; Dr. Ralph Lev, Rochester; Dr. Thomas W. Mears, Rochester; Dr. J. D. Mortensen, Rochester; Dr. William C. Nelson, Rochester; Dr. Mathew E. O'Keefe, Rochester; Dr. William F. Peters, Jr., Rochester; Dr. John R. Pettet, Rochester; Dr. Frederick R. Ritzinger, Lakefield; Dr. Everett J. Schmitz, Seattle, Washington; Dr. Ballard F. Smith, Rochester; Dr. Grant M. Stevens, Rochester; Dr. Joseph C. Tarantino, Rochester; Dr. Richard M. Ulery, Rochester; Dr. James D. Wentzler, Rochester; Dr. George Werner, Minneapolis; Dr. Roy A. White, Rochester; Dr. Richard K. Winkelmann, Rochester.

. . . the following applications for Affiliate Memberships were approved: Dr. David M. Berkman, Oronoco; Dr. Henry M. Broker, Minneapolis, Dr. Donald H. Daniel, Minneapolis; Dr. Rosemary R. Frear, Minneapolis; Dr. William H. Henney, McIntosh; Dr. Christian A. Rohrer, Des Moines, Iowa.

. . . the following applications for Life Memberships were approved: Dr. Alexander H. Brown, Pipestone; Dr. Hermanus De Boer, Edgerton; Dr. Charles N. Hensel, St. Paul; Dr. Andrew D. Hoidale, Tracy; Dr. Harry G. Irvine, Minneapolis; Dr. Carleton G. Kelsey, St. Paul; Dr. Fred H. Powers, Rochester; Dr. George F. Reineke, New Ulm; Dr. William H. Replogle, Los Angeles, California; Dr. John B. Robertson, Minneapolis; Dr. Dana C. Rood, Santa Barbara, California; Dr. Fredk. C. Schuldt, St. Paul; Dr. Walter H. Valentine, Tracy; Dr. Alfred E. Walker, St. Paul; Dr. Leon A. Williams, Minneapolis; Dr. Rasmus V. Williams, Rochester.

Dr. Waugh, chairman of the Special Committee appointed for consideration of a request for re-districting Councilor District No. 1, reported that he and the other two members of his committee had conducted a recent study of this problem. The committee submitted possible plans to alleviate this problem of unequal representation in this district. After considerable discussion, the Council voted to invite the delegates representing the county medical societies within this district to meet with the Council on Monday, May 26, to discuss the problem further.

. . . Council resolution proposing invocation at House of Delegates sessions was recommended for House of Delegates approval.

. . . Council recommended . . . Dr. Ivar Sivertsen for reappointment to the Minnesota State Board of Medical Examiners by virtue of the many years of faithful and meritorious service that he has rendered to the State of Minnesota.

. . . Council voted to entertain members of the senior class of the University of Minnesota Medical School at a joint dinner with Council to acquaint these students with the purposes and functions of medical organization.

After discussion of a request for state medical association aid in implementing a change in the existing law requiring licensure of resident physicians in hospitals in the state, Council decided that no effort should be made at this time to alter the existing law.

**In accordance with action by the Council of the Minnesota State Medical Association in 1944, publication of the proceedings of the House of Delegates is limited to summary.*

Council went on record as supporting the recommendation of the Sub-Committee on Physical Medicine and Rehabilitation to the Governor's Mental Health Advisory Committee, that, in the central office and in mental hospitals throughout the state, the therapeutic activities program should be under the direction of occupational therapists.

Council referred to the Committee on Nervous and Mental Diseases the proposed program of the Minnesota Society for the Mentally Retarded for the establishment of a new state institution for the mentally retarded, and securing an appropriation for such institution from the state legislature.

. . . Council voted to notify the Aetna Casualty and Surety Company of cancellation of the Association's group malpractice insurance policy, in view of the fact that this type of coverage is available to the individual physician at approximately the same rate as the group rate. Each individual physician should accordingly notify the Aetna Company of his intent to cancel out his policy thirty days in advance of cancellation.

Resolutions from the Arkansas Medical Society and the Tennessee State Medical Association, disapproving certain policies of the Veterans Administration hospitals in caring for non-service connected disabilities, were considered by Council. Council went on record as endorsing in principle the Tennessee resolution, requesting that AMA delegates lend support to any similar resolution.

. . . Council was acquainted with two resolutions from the Minnesota State Pharmaceutical Association thanking the Minnesota State Medical Association for its previous stand in condemning the physician-owned clinic pharmacy, and another resolution expressing appreciation for support in creating and maintaining a friendly relationship between the two professions.

The report of the Council was accepted as a whole, and Speaker Sheppard then called for reports of the reference committees. Dr. R. F. Hedin of Red Wing gave the report of the Reference Committee on Medical Education Reports.

Medical Education Reports

Dr. Hedin: The Reference Committee on Medical Education Reports met this morning. All members were present. The following reports were considered:

Committee on Cancer—A. H. Wells, M.D., Duluth, Chairman
Committee on Conservation of Hearing—L. R. Boies, M.D., Minneapolis, Chairman
Committee on First Aid and Red Cross—John S. Lundy, M.D., Rochester, Chairman
Heart Committee—F. J. Hirschboeck, M.D., Duluth, Chairman
Committee on Hospitals and Medical Education—H. S. Diehl, M.D., Minneapolis, Chairman
Committee on Public Health Nursing—Mario Fischer, M.D., Duluth, Chairman
Committee on Syphilis and Social Diseases—P. A. O'Leary, M.D., Rochester, Chairman
Committee on Tuberculosis—J. A. Myers, M.D., Minneapolis, Chairman
Committee on Vaccination and Immunization—R. N. Barr, M.D., Minneapolis, Chairman

The Committee accepted the reports with the following recommendations: that the Committee on Conservation of Hearing be furnished some information regarding the scope of work of the Audiological Clinic being instituted at the University; that the fine work being done by the Committee on First Aid and Red Cross be continued; that the committee agrees with the Committee on Cancer, believing that work should go on in the cancer detection field by the private physician, and that if a form which would be more suitable for use by the busy physician were available, that more information regarding cancer detection in Minnesota would be possible; that the Heart Committee study the feasibility of going into the rural communities and educating the medical profession in the fields of congenital heart disease for quicker detection and treatment; recognizes the extensive work done by the Committee on Hospitals and Medical Education and suggests that the committee contact all institutions of higher education in the state in an endeavor to interest them in establishing courses in medical technology, and to continue encouraging the formation of more practical nursing schools in the state; recognizes the fine work done by the Committee on Public Health Nursing; recognizes the fine work being done by the Committee on Syphilis and Social Diseases, noting that the incidence of these diseases is being reduced; that the recommendations of the Committee on Tuberculosis regarding the disease in displaced persons should be followed.

The House of Delegates approved the report of the Reference Committee on Medical Education Reports as a whole. Dr. Sheppard then called for the Report of the Reference Committee on Miscellaneous Scientific Reports, Dr. W. W. Yaeger, Marshall, Chairman.

Miscellaneous Scientific Reports

Dr. Yaeger: The Reference Committee for Miscellaneous Scientific Reports met in the Radisson Hotel on May 25, 1952, and considered the following reports:

Committee on Anesthesiology—R. C. Adams, M.D., Rochester, Chairman
Committee on Child Health—G. B. Logan, M.D., Rochester, Chairman
Committee on Chronic Illness—E. L. Tuohy, M.D., Duluth, Chairman
Editorial Committee—George Earl, M.D., St. Paul, Chairman
Committee on Diabetes—John R. Meade, M.D., St. Paul, Chairman
Committee on Fractures—E. T. Evans, M.D., Minneapolis, Chairman
Committee on General Practice—R. H. Creighton, M.D., Minneapolis, Chairman
Historical Committee—Robert Rosenthal, M.D., St. Paul, Chairman
Committee on Industrial Health—L. S. Arling, M.D., Minneapolis, Chairman
Committee on Maternal Health—J. J. Swendson, M.D., St. Paul, Chairman
Committee on Medical Testimony—E. M. Hammes, Sr., M.D., St. Paul, Chairman
Committee on Military Affairs—Jan H. Tillisch, M.D., Rochester, Chairman
Committee on Nervous and Mental Diseases—Walter P. Gardner, M.D., St. Paul, Chairman
Committee on Ophthalmology—T. R. Fritsche, M.D., New Ulm, Chairman
Committee on Public Health Education—F. J. Elias, M.D., Duluth, Chairman
Committee on Radio—Robert M. Burns, M.D., St. Paul, Chairman
Speakers Bureau—Haddon M. Carryer, M.D., Rochester, Chairman

The Committee approved the reports with the following recommendations and comments: that caution be taken regarding commitment of old age individuals unnecessarily to the state nervous and mental institutions; that the Committee on Diabetes continue their efforts to establish a diabetic camp for diabetic children of the state; that the component medical societies take more responsibility in accumulating historical materials as an aid to the Historical Committee; that the medical profession be cautioned against the issuance of certificates for unwarranted absenteeism; that every member of the medical profession give his full cooperation in transmitting information to the Committee on Medical Testimony, calling attention to the fact that it is held in strictest confidence; that better publicity be given to the work of the Committee on Military Affairs and that its spheres of activity might include close study of the Reserve Program of the Armed Forces as it involves physicians.

The House of Delegates accepted the report of the Reference Committee on Miscellaneous Scientific Reports.

Speaker Sheppard then called on Dr. C. L. Sheedy, Austin, Chairman of the Reference Committee on Medical Economics Reports, for his committee's report.

Medical Economics Reports

Dr. Sheedy: The Reference Committee on Medical Economics Reports met in the Hotel Radisson on May 25, 1952, and considered the following reports:

Editing and Publishing Committee—E. M. Hammes, Sr., M.D., St. Paul, Chairman
Committee on Hospitals and Professional Relations—J. M. Stickney, M.D., Rochester, Chairman
Committee on Interprofessional Relations—Walter P. Gardner, M.D., St. Paul, Chairman
Medical Advisory Committee—W. H. Hengstler, M.D., St. Paul, Chairman
Committee on Medical Economics—George Earl, M.D., St. Paul, Chairman
Committee on Medical Ethics—R. D. Mussey, M.D., Rochester, Chairman
Committee on University Relations—F. J. Elias, M.D., Duluth, Acting Chairman

The Committee accepted all reports, except that of the Committee on University Relations, with the following recommendations and comments: that the Committee on Interprofessional Relations consider a plan whereby local medical societies institute programs whereby they or an allied professional group such as the medical auxiliary or a nursing club initiate a program for senior high school girls to become acquainted with advantages offered by nursing and medical technology; that physicians, in buying malpractice insurance should keep in mind that malpractice insurance does not necessarily cover him for acts that are not malpractice, such as assault or slander; that a definite program of indoctrination in medical ethics and medical practice should be established for physicians just entering medical practice as well as the senior medical students, interns and residents of the state, and that a panel of physicians versed in malpractice cases be invited to talk to these groups on such subjects as the doctor in court and other legal tactics.

The House of Delegates heard considerable discussion and further explanation of the Rural Medical Scholarship plan, reported through the Committee on University Relations and the special Scholarship Selection Committee. After discussing details of operation and methods of administration, the House of Delegates accepted the report of the Reference Committee on Medical Economics with the exception of that committee's rejection of the student scholarship plan. The House accepted a motion approving the plan as originally set up by the Scholarship Selection Committee and the Committee on University Relations.

Dr. Sheppard then called on Dr. O. J. Campbell, Chairman of the Council, to present the balance of his report.

Dr. Campbell: Council met this morning with all officers and councilors in attendance, plus several guests.

. . . Dr. J. A. Bargen, Chairman of the Committee on Medical Service, acquainted Council with his committee's views on the Minnesota State High School League's schedule of maximum allowances for 1951-52, stating that his committee felt that the fees should be continued at the present level but that the fees are too low to be accepted as complete compensation for injuries received.

. . . Council recommended that, because of the illness of Dr. J. F. Norman, serving as Chairman of the University Relations Committee, Dr. F. J. Elias continue to serve as acting chairman.

. . . Council voted support of the resolution of the Minnesota Society of Clinical Pathologists opposing any move to obtain American Medical Association approval of a specialty board in medical microbiology which will certify non-physicians in the field of medical practice.

. . . Council directed the Association's Cancer committee to work with the local and national cancer societies in developing a standard form which will embody an adequate examination for cancer detection.

. . . Council discussed thoroughly the problem that has been created by a reduction of our Delegates to the American Medical Association from four to three on the basis of our paid membership in the AMA. The proposed plan is to try to seat all four delegates at the meeting, but if this is impossible, to make a concerted effort to gain in membership during 1952, to enable a resumption of the four-man delegation in 1953.

. . . Council granted approval to the Maternal Mortality Committee to submit reports of maternal deaths investigated to the doctors concerned without assessment of responsibility.

. . . Council presents the name of Dr. J. A. Bargen for re-election as a delegate for the years 1953 and 1954.

The House of Delegates next heard a supplementary Council report from the Committee on Group Health and Accident Insurance, which outlined certain principles which underwriters must meet to qualify as having policies available for advocation to the membership. The House accepted the report of the Council as a whole.

Speaker Sheppard next called for the report of the Reference Committee on Miscellaneous Medical Economics Reports, Dr. A. B. Hunt, Rochester, Chairman.

Dr. Hunt: The Reference Committee for Miscellaneous Medical Economics Reports met in the Radisson Hotel on May 25, 1952, and considered the following reports:

Insurance Liaison Committee—Clarence Jacobson, M.D., Chisholm, Chairman
Committee on Medical Service—J. A. Bargen, M.D., Rochester, Chairman
Committee on Rural Medical Service—Paul C. Leck, M.D., Austin, Chairman
Committee on State Health Relations—C. E. Proshek, M.D., Minneapolis, Chairman
Committee on Veterans Medical Service—Ralph H. Creighton, M.D., Minneapolis, Chairman

The committee accepted the committee reports with the following comments and recommendations: that the House of Delegates and Council support the further efforts of the Insurance Liaison Committee to bring to fruition the vision that the late Dr. Adson and other members of the committee had for the Minnesota Medical Insurance Plan; that the Committee on Rural Medical Service arrange with the Minnesota Society of Clinical Pathologists and the Minnesota Radiological Society for regular x-ray and diagnostic services and for routine pathologic study of all tissues removed where such services are not already satisfactorily in effect.

The report was accepted as a whole by the House and the Speaker called for the report of the Reference Committee for Officers and Councilors Reports, Dr. L. E. Steiner, Albert Lea, Chairman.

Dr. Steiner: The Reference Committee for Officers and Councilors Reports met in the Hotel Radisson on May 25, 1952, and the following reports were discussed: Secretary's and Executive Secretary's Report, Councilor Reports from Districts One through Nine.

The report of the Chairman of the Council was accepted, noting the initiation of the rural medical school scholarship, urging House consideration of the proposed increase in membership dues, recommending that the House should be brought up to date on the status of the malpractice insurance policies and rates.

The reports of the Councilors of the nine districts were accepted.

The committee accepted all proposed changes in the Constitution and By-Laws proposed by the Council, and these will be presented in a separate report.

The House of Delegates accepted the report as a whole and then discussed and approved the numerous changes in the Constitution and By-Laws as approved by the Reference Committee for Officers and Councilors Reports. (Changes reviewed completely elsewhere in this issue.)

The House of Delegates adjourned at 5:45 p.m.

Second Meeting, Sunday, May 25, 1952

Gold Room, Hotel Radisson

Minneapolis, Minnesota

The second meeting of the House of Delegates of the Minnesota State Medical Association reconvened in the Gold Room of the Hotel Radisson, Minneapolis, Minnesota, at 8 p.m., with Dr. Sheppard presiding.

Dr. Sheppard called on Dr. Wesley Spink to give the report of the Minnesota Medical Foundation. Dr. Spink reported that during the current year, the Foundation awarded ten scholarships of $500 each. The Foundation has nearly 1,000 members.

The House next heard the report from the University of Minnesota Medical School, presented by Dr. H. S. Diehl, who reported that the school accepted between 125 and 130 students annually into the Freshman class. Dr. Diehl also reported on the progress of the building project at the medical school.

Dr. Sheppard called for the report of the Minnesota State Board of Medical Examiners, presented by Dr. F. H. Magney of Duluth. During 1951, 300 medical licenses were issued, 166 by reciprocity from other states, and 39 on the basis of the licensing by the National Board of Medical Examiners, the remainder by examination.

Dr. Raymond Bieter of Minneapolis then presented the report of the Minnesota State Board of Examiners in the Basic Sciences. He noted that a total of 808 individuals took the basic science examination during the past year, with 475 failing, making a failure rate of 58.7 per cent.

Dr. A. J. Chesley presented his report from the Minnesota Department of Health. This was followed by the report of the Old Age Assistance program under the Minnesota Division of Social Welfare, presented by Mr. Alfred Angster, stating that expenditures for medical care under this program for 1952 were estimated to be between eight and nine million dollars.

The report of Minnesota Medical Service was presented by Dr. E. J. Simons, Medical Director for Minnesota Blue Shield. He reported that much progress had been made and called for co-operation from physicians.

The Speaker then called for the Necrology Report, read by Dr. Haddon M. Carryer of Rochester. A moment's silence was observed.

The meeting adjourned at 10:45 p.m.

Third Meeting, Monday, May 26, 1952

Gold Room, Hotel Radisson

Minneapolis, Minnesota

The House of Delegates reconvened at 1:30 p.m. with Speaker C. G. Sheppard presiding.

The Speaker called for the report of the special committee to study the indigent doctor problem. Dr. W. R. Humphrey, Stillwater, Chairman, reported his committee's views that a definite need exists and asked that a voluntary contribution of $10 or more per member be solicited through the state office, to be administered through the county societies. The House voted approval of the program.

Speaker Sheppard next called for the report of the Resolutions Committee, Dr. F. J. Hirschboeck, Duluth, Chairman. Dr. Hirschboeck requested that in the future, resolutions should reach the committee within a specified deadline, so that the committee could have ample time to discuss and pass on resolutions.

Resolutions Committee Report

WHEREAS, the House of Delegates desires to record its appreciation of the individuals and organizations whose efforts have contributed to the success of the ninety-ninth annual meeting of the Minnesota State Medical Association,

THEREFORE, BE IT RESOLVED, that the following be apprised of the Association's grateful recognition of their co-operation:

The Officers and Members of the Hennepin County Medical Society and its Auxiliary and the Committee on Local Arrangements, for a well co-ordinated arrangement of facilities for the events of the Convention and for their cordial hospitality to Convention guests,

The Mayor of Minneapolis, the Minneapolis Chamber of Commerce, and the management and personnel of the Minneapolis hotels for welcoming Minnesota physicians and their guests and assuring them a pleasant stay in Minneapolis,

The newspapers and radio stations which co-operated in transmitting to the public the news of medical developments which are of interest and concern to the entire state.

* * *

WHEREAS, the serious nature of state, national, and world affairs today warrants seeking divine guidance and aid, and

WHEREAS, it is customary practice for most legislative bodies to convene their meetings with a solemn word of prayer,

THEREFORE, BE IT RESOLVED, that the House of Delegates of the Minnesota State Medical Association begin all meetings with an invocation, such invocation to be rotated annually among the different religious faiths.

* * *

WHEREAS, it appears desirable that medical students be impressed with the opportunity afforded in general practice, and the existing need for general practitioners,

AND WHEREAS, in furtherance of this purpose, and also to provide a more extended means of orientation into actual practice, senior medical students should be given the advantage of working with general practitioners before their clerkship begins,

THEREFORE BE IT RESOLVED, by this Society, that a preceptorship of about three months duration between the junior and senior years of medical students is deemed advisable,

That such preceptorship be on a voluntary basis, or otherwise as may be determined in the recommendations of the appropriate committee assigned the task of working out details incident to such preceptorship,

That it be requested that the Committee on Hospitals and Medical Education be so assigned, to work with the Medical School Administration of the University toward the establishment of proposed preceptorship.

This resolution was referred to the Committee on Hospitals and Medical Education.

* * *

WHEREAS, attention has been called to certain dissatisfaction centering around the apparent unwillingness of some Medical School department heads to call in practicing physicians from the Minneapolis and St. Paul areas, as well as outside these areas, to lecture to medical students,

AND WHEREAS, it appears desirable to foster better working relationships existing between the Medical School faculty and the practicing physicians,

THEREFORE, BE IT RESOLVED, that the Hospitals and Medical Education Committee be authorized to inquire relative to the same and report their findings and recommendations to the House of Delegates in the year 1953.

This resolution was referred to the Committee on Hospitals and Medical Education.

* * *

WHEREAS, an application is presently being processed with the intent of obtaining AMA approval of a Specialty Board in Medical Microbiology which will certify non-physicians as diplomats in a field of medical practice,

AND WHEREAS, there is already in existence an American Board of Pathology, which can provide certification of properly qualified physicians in the field of Medical Microbiology,

NOW, THEREFORE, BE IT RESOLVED, that the House of Delegates reaffirm its approval of the essentials for an approved Examining Board in a Medical Specialty, including the principles that applicants for examination must be graduates of a Medical School approved by the Council on Medical Education and Hospitals and must be licensed to practice medicine,

AND BE IT FURTHER RESOLVED, that the House of Delegates instruct the Council on Medical Education and Hospitals to limit its approval of Specialty Boards to those which can comply with these essentials, in order to safeguard the interests and welfare of patients.

* * *

WHEREAS, there have been numerous complaints from members of county societies as to the method of admission and the disposition of patients examined at the University of Minnesota Cancer Detection Center,

AND WHEREAS, there have been complaints about the publicity emanating from the Cancer Detection Center which tends to magnify the importance of group examination,

AND WHEREAS, there has been some question as to the ratio between the costs involved and the positive findings obtained,

THEREFORE, BE IT RESOLVED, that the House of Delegates of the Minnesota State Medical Association evaluate the operation of, and the advisability of, continuance of the Cancer Detection Center.

* * *

WHEREAS, State Health Regulation Number 1001 which states that it shall be the duty of any physician or midwife in attendance on, or in charge of, a confinement case to treat the eyes of every newborn babe with a 1% solution of silver nitrate,

AND WHEREAS, the use of silver nitrate in the eyes of newborn very frequently causes marked irritation,

AND WHEREAS, there are other preparations just as efficient but less irritating,

THEREFORE, BE IT HEREBY RESOLVED, that State Health Regulation Number 1001 be modified.

This resolution was referred to the Child Health Committee.

* * *

WHEREAS, the hospital and medical care of the veteran with service connected disability or disease and the care of the medically indigent veteran with non-service connected disability or disease is and should be the just concern of the public and the medical profession, and

WHEREAS, the free care of the veteran with non-service connected disability or disease who can pay for his hospitalization and medical care is contrary to our traditional system of government and is an unwarranted burden on the taxpayer and threatens the quality of care to the deserving veteran by overloading the professional services of Veterans Hospitals, and

THEREFORE, BE IT RESOLVED, that the House of Delegates of the Minnesota State Medical Association goes on record as requesting its delegates to the American Medical Association to promote this position. Copies are also to be furnished the local and national offices of the Veterans Administration.

* * *

WHEREAS, the principles of medical ethics specifically condemn consultation with others than licensed doctors of medicine, and

WHEREAS, such consultation lowers the honor and dignity of the profession, and

WHEREAS, such consultation has brought about distress and hardship to members of the American Medical Association elsewhere,

THEREFORE, BE IT RESOLVED, that on complaint of any member of this Society or members of any constituent body of the American Medical Association offenders be reminded of a violation of the principles of medical ethics by the appropriate committees of this Society or constituent county or regional medical societies.

This resolution was referred to the Committee on Medical Ethics.

The House of Delegates voted approval of the report.

Dr. Sheppard next called on Dr. Campbell for the final report from the Council.

DR. CAMPBELL: The Council convened at 8 a.m. for its scheduled meeting with the Blue Shield Board of Directors and received their favorable report on progress achieved during the past year.

. . . Council met with delegates from counties in the First Councilor District and a free expression of views on the problem involved in the matter of re-districting this district were exchanged. Council voted to continue the work of the present committee, with instructions to call representatives of each of the concerned counties to a meeting for further exploration of opinion and ideas as to a solution of the problem.

. . . Council voted approval of a request for $250 from the Committee on Maternal Health for completion of its study on maternal mortality, and another of $500 from the Committee on Hospitals and Medical Education for study of medical education.

. . . Council adjourned at 12:30 p.m.

The House of Delegates accepted the report of the Council.

Election of Officers

The next order of business was the election of Association Officers. Upon recommendation of the Nominating Committee, the House elected the following:

President-Elect—O. J. Campbell, M.D., Minneapolis

First Vice President—Justus Ohage, M.D., St. Paul

Second Vice President—C. E. Merkert, M.D., Minneapolis

Secretary—B. B. Souster, M.D., St. Paul

Treasurer—W. H. Condit, M.D., Minneapolis

Speaker, House of Delegates—C. G. Sheppard, M.D., Hutchinson

Vice Speaker, House of Delegates—H. M. Carryer, M.D., Rochester

Councilor, Third District—L. G. Smith, M.D., Montevideo

Councilor, Fifth District—L. R. Critchfield, M.D., St. Paul

Councilor, Sixth District—H. B. Sweetser, Jr., M.D., Minneapolis

Councilor, Seventh District—W. W. Will, M.D., Bertha

Dr. J. A. Bargen, Rochester, was re-elected a member of the House of Delegates of the American Medical Association; Dr. Paul C. Leck, Austin, was elected as Dr. Bargen's alternate delegate to the House of Delegates of the American Medical Association.

Meeting Place, 1953 Convention

In its final order of business, the House of Delegates accepted the invitation of the Ramsey County Medical Society to hold the 1953 annual meeting, the centennial celebration, in the city of St. Paul.

The House of Delegates of the Ninety-ninth Annual Meeting of the Minnesota State Medical Association adjourned at 2:30 p.m.

CONSTITUTIONAL CHANGES

(Editor's Note: In accordance with the Constitution of the Minnesota State Medical Association, any proposed amendments to the Constitution must be published in the official Journal of the Association not less than three months before the meeting at which final action is to be taken. The following constitutional changes were tentatively approved at the Ninety-Ninth annual meeting of the Association's House of Delegates, May 26, 27 and 28 in Minneapolis. The proposed changes appear in italics. They bring the Constitution up to date and in conformity with that of the American Medical Association.)

CONSTITUTION

Article I—Name of the Association

The name of this organization is the MINNESOTA STATE MEDICAL ASSOCIATION which may hereinafter be referred to as the Association.

Article II—Purposes of the Association

The purposes of this Association are to bring into one compact organization the entire medical profession of the State of Minnesota and to unite with similar societies of other states to form the American Medical Association; to promote the science and art of medicine; to elevate the standard of medical education; and to promote public health.

Article III—Location

The headquarters of the MINNESOTA STATE MEDICAL ASSOCIATION, incorporated under the laws of Minnesota, is located in the City of St. Paul, County of Ramsey and State of Minnesota.

Article IV—Component Societies and Councilor Districts

Section 1. The membership of this Association shall be organized into county and district medical societies. The functions of each such society and its relation to the Association shall be defined in a charter issued to it by the Association. Every charter so issued shall be subject to amendment and to revocation by the Association in such manner as may be prescribed in the By-Laws of the Association.

Sec. 2. A component county society is an aggregation of members of this Association living in one county.

Sec. 3. A component district society is an aggregation of members of this Association living in such districts as to make the organization of individual county societies inadvisable, or an amalgamation of two or more county societies.

Sec. 4. The Council, with the approval of the House of Delegates, shall designate the number of councilors and shall arrange the component societies into councilor districts.

Article V—Membership Classifications

This Association shall consist of active, life, service, affiliate, residency, honorary and associate members, as specified in the By-Laws.

Article VI—House of Delegates

The House of Delegates shall be the governing body of the Association, and shall consist of the delegates elected by the component societies to represent them. The following shall have the privileges of the floor, but without the right to vote; the President, the President-Elect, the Councilors, the Secretary, the Treasurer, the Past Presidents, and the Delegates to the American Medical Association.

Article VII—Council

The Council shall be the executive body of the Association. The Council shall have the full authority and power of the House of Delegates between Annual Sessions, unless the House of Delegates shall be called into special session as provided for in the By-Laws. The Council shall consist of the Councilors and ex officio but without the right to vote, the President, the First Vice-President, the President-Elect, the immediate Past President, the Secretary, the Treasurer, the Speaker of the House of Delegates, and the elected delegates to the American Medical Association. A majority of the Councilors shall constitute a quorum.

Article VIII—Annual Sessions and Meetings

Section 1. This Association shall hold an Annual Session, during which there shall be held General Meetings, which shall be open to all registered members and guests.

Sec. 2. The general time and place for holding each Annual Session shall be fixed by the House of Delegates, except that the exact date of the Session may be fixed by the Council.

Sec. 3. Special Meetings of either the Association or the House of Delegates may be called by the President on a two-thirds vote of the Council or upon petition by twenty delegates representing at least ten component societies.

Sec. 4. All Meetings of the Council shall be called by the Chairman of the Council or upon petition by three Councilors.

Article IX—Officers

Section 1. The officers of this Association shall be a President, a President-Elect, two Vice-Presidents, a Secretary, a Treasurer, a Speaker and Vice-Speaker of the House of Delegates, and a Councilor for each Councilor District. These officers shall be elected by the House of Delegates as hereinafter provided in the By-Laws.

Sec. 2. There shall be elected at the Annual Session one who shall be known as President-Elect until the beginning of the next calendar year which is also the fiscal year of the Association, at which time he automatically becomes president, to serve as such for one year.

Sec. 3. The other officers, except the Councilors, shall be elected annually. The terms of the Councilors shall be for three years. As nearly as possible, one-third of the members of the Council shall be elected each year.

Sec. 4. The Delegates and Alternate Delegates to represent this Association at the House of Delegates of the American Medical Association shall be elected in accordance with the Constitution and By-Laws of the American Medical Association.

Sec. 5. Terms of office of the officers and committeemen, unless otherwise provided, shall be for a term of one year from January first following the date of their election.

Sec. 6. In case of vacancy in an office, unless otherwise provided for in this Constitution or By Laws, the Council shall have the power to appoint temporarily a successor, until the House of Delegates shall meet and elect one, or until the next Annual Session.

Article X—Funds and Expenses

The Annual Dues shall be determined by the House of Delegates by a two-thirds vote of the delegates present. Funds may also be raised from the Association's publications, by voluntary contributions, and in other manner approved by the House of Delegates. Funds may be appropriated by the House of Delegates to defray expenses of the Association, for scientific and educational publications, and for such other purposes as will promote the advancement of medicine. All resolutions appropriating funds must be approved by the Council before action is taken thereon.

Article XI—The Seal

The Association shall have a common seal, and the House of Delegates shall have the power to break, change or renew the same.

Article XII—Amendments

Section 1. The House of Delegates may amend any article of this Constitution by a two-thirds vote of the Delegates present at any Annual Session, provided that such amendment shall have been submitted to the membership in writing and published in the official Journal of the Association not less than three months before the meeting at which final action is to be taken.

Sec. 2. The House of Delegates, at any Annual Session, may instruct the Council to make any changes in the Articles of Incorporation in accordance with the law, which may appear desirable or which may be made necessary by any change or amendment to the Constitution and By-Laws of the Association.

Sec. 3. Upon adoption of this Constitution all previous Constitutions are thereby repealed.

Article XIII—By-Laws

The authority for passing By-Laws to the Constitution of the Association shall be vested in the House of Delegates.

In Memoriam

CHRISTOPHER GRAHAM

Dr. Christopher Graham, the last survivor of the original Mayo Clinic group, died June 20, 1952, at the age of ninety-six.

Born in New York state but in infancy brought to Olmstead County, Minnesota, Dr. Graham graduated from the University of Minnesota in 1887, where he played on the first University football team. Before he was graduated from the University he had taught in rural schools. For a period of two years after graduation he taught at Shattuck, where he coached athletic teams.

In 1892 he graduated from the Veterinarian School at the University of Pennsylvania and returned to teach veterinary science in the school of agriculture at the University of Minnesota. He took the M.D. degree at the University of Pennsylvania in 1894. He was the first intern at Saint Mary's hospital in Rochester.

Joining the group of Doctors Mayo and Stinchfield in 1894, he seems to have formally entered the group as a partner in 1895. For some years his main interest was obstetrics but, by 1914, he became head of the division of medicine at the Mayo Clinic. He was professor of medicine at the Mayo Foundation from 1915 to 1919.

In 1919 Dr. Graham retired from the practice of medicine to devote himself to the breeding of Holstein cattle in particular and livestock in general.

Mrs. Graham, the former E. Blanche Brackenridge, survives the doctor at the age of eighty-nine. A son, Malcolm, and a daughter, Mrs. George M. Lowry, both of Rochester, also survive him.

PETER FREDERICK HOLM

Dr. Peter F. Holm, specialist in eye, ear, nose and throat at Wells, Minnesota, for thirty-five years, died at Sarasota, Florida, June 25, 1952, at the age of seventy-nine.

Dr. Holm was born in Denmark, November 26, 1872, and at the age of twelve came to this country, where his parents settled at Waverly, South Dakota. He attended schools at Watertown, South Dakota, and in 1898 obtained his M.D. degree from the Bellevue Hospital Medical College in New York. He graduated fourth in his class and received a faculty award of $100. After interning at the Hackensack General Hospital in Hackensack, New Jersey, he came to Wells in 1899. Postgraduate work in the special senses was taken in Chicago and New Orleans.

Dr. Holm served as coroner for many years and was a past-president of the Blue Earth Valley Medical Society. At one time he was vice president of the Southern Minnesota Medical Association.

Dr. Holm is survived by his wife, the former Bertha E. Kohlhase; one daughter, Maryon Holm Angelillo, and one son, Roger G., all of Sarasota and vicinity.

Dr. Holm sold his practice in 1933 and travelled extensively in recent years. He suffered from pernicious anemia for over twenty years before his death.

OSCAR V. JOHNSON

Dr. Oscar V. Johnson, a practitioner in Minnesota for thirty-eight years, died at his home in Springfield, Ohio, July 24, 1952 at the age of seventy-four.

Dr. Johnson was born at Carver, Minnesota, May 29, 1878. He attended North High School in Minneapolis and obtained his M.D. degree from the University of Minnesota in 1905. He interned at Swedish Hospital in Minneapolis and practiced in Sebeka, Minnesota, from 1905 to 1927. He then located in Fergus Falls. where he practiced seventeen years. He took postgraduate study in New York in 1908, in London in 1913, and in Chicago in 1928. In 1944 he moved to Benton, Michigan, where he practiced until he moved to Springfield, Ohio, in 1949.

Dr. Johnson specialized in eye, ear, nose and throat diseases and was a member of the Park Region Medical Society, the Minnesota State Medical Association and the American Medical Association. He was a member of the Library Board of Fergus Falls and the Staff of St. Luke's Hospital. He was also a member of the Wadena A.F. & A.M. Lodge No. 156 and of the Scottish Rite and Zuhrah Temple, both of Minneapolis.

Dr. Johnson is survived by his wife and one daughter, Mrs. Daniel Drake of Springfield, Ohio.

WILLIAM B. TORGERSON

Dr. William B. Torgerson, a practitioner in Oklee, Minnesota, since 1912, died July 6, 1952 at the age of eighty. He had been afflicted with Parkinson's disease since 1941 and had been forced to curtail his practice until his retirement in 1949.

Dr. Torgerson was born in Lake Mills, Iowa, October 27, 1872. He attended Luther College in Decorah, Iowa, and obtained his medical degree from the University of Minnesota in 1897. After taking postgraduate work at New York Polyclinic and Chicago Postgraduate School, he began practice at Cannon Falls in 1898. He practiced in Clarkfield from 1898 to 1907 and at Greenbush from 1909 to 1912.

He was a member of the Red River Valley Medical Society, a component society of the Minnesota State Medical Association and the American Medical Association. A leader in community activities, he long served as a member and treasurer of the local school board. He also served as village treasurer, was one of the founders of the Commercial Club and was for a long time a member of the board of directors and secretary of the Oklee Co-operative Creamery Association. He was a member of Zion Evangelical Lutheran Church and was long a member of the church choir and director of the Sunday School.

Dr. Torgerson was married to Ingeborg Ohnstad in 1900. He is survived by his wife and five children: Mrs. R. E. Bilbrough of Kansas City, Erling of Thief

ANNOUNCES CONTINUOUS COURSES

SURGERY—Intensive Course in Surgical Technic, two weeks, starting September 8, September 22, October 6.
Surgical Technic, Surgical Anatomy and Clinical Surgery, four weeks, starting September 8, October 20.
Surgical Anatomy and Clinical Surgery, two weeks, starting September 22, November 3.
Surgery of Colon and Rectum, one week, starting September 15.
Gallbladder Surgery, ten hours, starting October 20.
Basic Principles in General Surgery, two weeks, starting September 8.
General Surgery, one week, starting October 6.
General Surgery, two weeks, starting October 6.
Breast and Thyroid Surgery, one week, starting October 6.
Esophageal Surgery, one week, starting October 13.
Thoracic Surgery, one week, starting October 20.
Fractures and Traumatic Surgery, two weeks, starting October 6.
GYNECOLOGY—Intensive Course, two weeks, starting September 8, October 20.
Vaginal Approach to Pelvic Surgery, one week, starting September 22, November 3.
OBSTETRICS—Intensive Course, two weeks, starting September 29, November 3.
MEDICINE—Electrocardiography and Heart Disease, two weeks, starting September 29.
Intensive General Course, two weeks, starting October 13.
Gastroscopy and Gastroenterology, two weeks, starting September 15, November 3.
UROLOGY—Intensive Course, two weeks, starting September 8.
Cystoscopy, ten days, starting every two weeks.
DERMATOLOGY—Intensive Course, two weeks, starting October 13.

Communication

June 24, 1952

To the Editor:

I should like to take this means of expressing my thanks to the many physicians throughout the state who responded to the recent questionnaire concerning the continuation medical education program. As a result of this inquiry, much important information was secured and many exceedingly helpful suggestions and criticisms were offered.

Our continuing aim will be to present practical material and information concerning important advances in the various fields of medicine. Suggestions concerning subjects for courses or any other aspect of the continuation medical education program are always welcome.

Sincerely yours,

ROBERT B. HOWARD, M.D., Director,
Department of Continuation Medical
Education, University of Minnesota
Medical School.

COMPENSABLE DISABILITY

(Continued from Page 743)

ability were evolved. These details have been explained elsewhere.**

The principle of calculating a disability by this method remains the same in all instances. When the useful range of motion in a joint is used as a criterion for establishing a disability, then most of the other factors which contribute to a disability have been given consideration in that the factors causing disability lie within the arc of disabled motion. To that extent the patient is asked to move the disabled joint only through its useful range of motion. Forced motions, painful motions, or other disabled motions which might extend beyond the useful range are not measured, and to that extent the disabled motions have been given consideration.

A certain amount of liberty may be taken with these figures, depending upon the judgment of the surgeon. When the calculations have been made, the final figure is usually placed at the closest unit of five.

This method of calculating disability is not designed to eliminate a surgeon's judgment; it is intended to aid him.

Reports and Announcements

INTERNATIONAL COLLEGE OF SURGEONS

The United States and Canadian Chapters of the International College of Surgeons will hold their Seventeenth Annual Assembly in Chicago at the Conrad Hilton Hotel on September 2, 3, 4, and 5, 1952. An excellent clinical program has been arranged which will present a comprehensive review of the latest concepts in surgery by world-renowned teachers. One hundred and sixty scientific and technical exhibits will be featured.

The convocation address will be given by the Right Honorable Lord Horder, G.C.V.O., M.D., B.Sc., F.R.C.P., London, who will talk on "Freedom in Medicine."

Dr. Horder is extra physician to the Queen of England, consulting physician to St. Bartholomew's Hospital; Honorary Adviser to Ministries of Food, Labor and Pensions, chairman of the British Empire Cancer Campaign, chairman of the Empire Rheumatism Council, and chairman of Fellowship for Freedom in Medicine.

AMERICAN COLLEGE OF CHEST PHYSICIANS

The American College of Chest Physicians held their annual meeting at the Congress Hotel in Chicago on June 5-8, 1952.

Dr. Chevalier Jackson, Philadelphia, was awarded the College Medal for meritorious achievement in the specialty of diseases of the chest. An essay award was also presented to Dr. C. Walton Lillehei, of the Department of Surgery of the University of Minnesota Medical School, for an essay on "Experimental Bacterial Endocarditis and Proliferative Glomerulonephritis." The award included a cash prize of $250.00.

The officers elected for 1952-53 were: president, Andrew L. Banyai, Milwaukee, and president-elect, Alvin E. Green, Houston. Dr. John F. Briggs, St. Paul, is a member of the Board of Regents and Dr. Herman J. Moersch, Rochester, is a member of the Board of Governors.

The next annual meeting will be held in New York City at the Hotel New Yorker on May 28-31, 1953.

AMERICAN DERMATOLOGICAL ASSOCIATION PRIZE ESSAY CONTEST

The American Dermatological Association is again offering a prize of three hundred dollars for the best essay submitted for original work, not previously published, relative to some fundamental aspect of dermatology or syphilology. The purpose of this contest is to stimulate investigators to original work in these fields.

Manuscrips typed in English with double spacing and ample margins as for publication, together with illustrations, charts, and tables, all of which must be in *triplicate,* are to be submitted not later than January 1, 1953. The manuscripts should be sent to Dr. Louis A. Brunsting, Secretary, American Dermatological Association, 102-110 Second Avenue, Southwest, Rochester, Miinesota. Those which are incomplete in any of the above respects will not be considered.

Competition in this prize contest is open to scientists generally, not necessarily to physicians.

The award will be made by a committee of judges selected to pass on the essays by the Research Aid Committee of the American Dermatological Association and the decision of the judges shall be final. The essays are judged on the following considerations: (1) originality of ideas; (2) potential importance of the work; (3) experimental methods and use of controls; (4) evaluation of results; (5) clarity of presentation. This contest is planned as an annual one, but if in any year, at the discretion of the Committee and judges, no paper worthy of a prize is offered, the award may be omitted.

The prize-winning candidate may be invited to present his paper before the annual meeting of the American Dermatological Association with expenses paid in addition to the three hundred dollar prize. Further information regarding this essay contest may be obtained by writing to the Secretary of the American Dermatological Association.

The next annual meeting of the American Dermatological Association will be held June 9-13, 1953, at The Lake Placid Club, Essex County, New York.

PSYCHIATRIC RESIDENT PROGRAM

The California Department of Mental Hygiene is offering a five-year psychiatric resident program for physicians wishing to qualify for the certificate of the American Board of Psychiatry and Neurology. The first, third and fourth years will be devoted to regular psychiatric residency training. The second and fifth years, the resident serves as a staff psychiatrist at a California State hospital or clinic. The salary starts at $436 a month, with yearly increases that bring it to $530 a month for the fifth year.

Inquiries may be sent to the California State Personnel Board, 1015 L Street, Sacramento, California.

VAN METER PRIZE AWARD

The American Goiter Association is again offering the Van Meter Prize Award of $300.00 and two honorable mentions for the best essays submitted on original work in problems related to the thyroid gland.

These essays may cover either clinical or research investigations and should not be longer than 3,000

words. They must be written in English and typed, double spaced copy in duplicate should be sent to Corresponding Secretary Dr. George C. Shivers, 100 East Saint Vrain Street, Colorado Springs, not later than February 15, 1953.

The judging committee is composed of men particularly qualified to analyze the merits of the essays submitted.

In the event that essays of sufficient merit are entered in the competition, the award will be presented at the annual meeting of the Goiter Association to be held in Chicago on May 7, 8, 9, 1953, and a place will be reserved on the program for the author, if it is possible for him to attend. The essay will also be published in the Proceedings of the Association.

FISK FUND PRIZE DISSERTATION

"The Present Status of Anti-Coagulent Therapy" is the subject announced by the trustees of the Caleb Fisk Fund of Rhode Island Medical Society for their 1952 prize dissertation.

An award of $200 will be presented to the author of the best dissertation submitted. Entries must be received by December 1, 1952, with a motto thereon, and a sealed envelope included with the same motto inscribed on the outside and the name and address of the author inside. The successful contestant will also agree to read his paper before the Rhode Island Medical Society at its annual meeting on May 7, 1953. Copy must be typed, doubled spaced and should not exceed 10,000 words.

For further information write to the Rhode Island Medical Society, 106 Francis Street, Providence 3, R. I.

BIOLOGICAL PHOTOGRAPHIC ASSOCIATION

The Upper Midwest Chapter of the Biological Photographic Association decided to hold one "open" meeting and to extend an invitation to persons of this area who have a sincere interest in scientific photography.

The meeting will be held September 27 and 28 in Room 111, Owre Hall, on the Main Campus of the University of Minnesota, starting at 1:00 P.M. on Saturday, September 27. The wives of men attending are cordially invited to attend the meeting or the banquet or both.

The Saturday afternoon session will consist of a tour of the Sound Stage of the Audio Visual Shop of the University and will be followed by lectures and demonstrations covering these subjects—

1. Cinephotomicrography of the circulatory system in a bat's wing.

2. Autoradiography—a new technic using both gamma and beta radiation.

WHEN DIETARY SUPPLEMENTATION IS NEEDED...

what more could a supplement provide?

If the concept of an ideal dietary supplement could be formulated, it might well be one that provides qualitatively every substance of moment in human nutrition. It would provide those for which human daily needs are established as well as others which are considered of value, though their roles and quantitative requirements remain unknown.

How Ovaltine in milk approaches this concept, and how well the recommended three glassfuls daily augment the nutritional intake, is shown in the appended table. The two forms of Ovaltine available—plain and chocolate flavored—are closely alike in their nutrient values.

THE WANDER COMPANY, 360 N. MICHIGAN AVE., CHICAGO 1, ILL.

3. Stereo-photomicrography in color for plant pathology.

4. Use of the Dye Transfer Process in medical photography.

Time will be allowed for answers to questions from the audience.

The Saturday evening session will consist of the banquet, a brief business meeting of the Chapter and reports of the delegates to the national conventions of the Biological Photographic Association and the Photographic Society of America. Discussion will be held at this time concerning the advisability of holding one-day seminars on specific photographic processes during the year.

An Open House will be held starting Sunday morning in the Dental and Medical photographic laboratories of the University.

For reservations write to J. H. Rothenberger, School of Dentistry, University of Minnesota, Minneapolis 14.

DEDICATION OF MEDICAL SCIENCES BUILDING AT MAYO CLINIC AND MAYO FOUNDATION

A new addition to the Medical Sciences Building of the Mayo Clinic and Mayo Foundation at Rochester, Minnesota, will be dedicated on September 26 by Dr. Vannevar Bush, president of the Carnegie Institution of Washington, D. C., director of the Office of Scientific Research and Development from 1941 to 1946, and prominent in research endeavors in various fields of science in the United States. Dr. James Lewis Morrill, president of the University of Minnesota; Dr. Victor Johnson, director of the Mayo Foundation for Medical Education and Research; and Dr. Theodore C. Blegen, dean of the Graduate Cchool, University of Minnesota, are expected to take part in the dedication exercises.

On the same day Frank C. Mann Hall in the Medical Sciences Building will be dedicated. It is named for Dr. Frank C. Mann, who was for many years director of the Mayo Foundation Institute of Experimental Medicine and professor of experimental surgery in the Mayo Foundation, Graduate School, University of Minnesota. Speakers at this occasion will be Dr. Owen H. Wangensteen, professor and chairman of the Department of Surgery in the University of Minnesota Medical School at Minneapolis; Dr. Lester R. Dragstedt, Thomas D. Jones, Distinguished Service Professor and chairman of the Department of Surgery, University of Chicago; and Dr. Chester Morse Jones, clinical professor of medicine in the Harvard University Medical School.

The addition to the Medical Sciences Building was begun in April, 1949. It is a five-and-a-half story building 130 by 152 feet, and enlarges the capacity of the Medical Sciences Building to a total of 140,000 square feet of floor space which can be devoted to useful purposes. The completed construction brings together in a single modern, conveniently located structure, the laboratory facilities for medical education and research; and provides these fundamental fields of medi-

cine an opportunity for closer collaboration not only with one another but with the various clinical and surgical fields.

AMERICAN COLLEGE OF SURGEONS

The Forum on Fundamental Surgical Problems, one of the most important features of the 38th Clinical Congress of the American College of Surgeons to be held at the Waldorf-Astoria, New York City, September 22 through 26, will again be a focus of national attention because of its consistent record of encouraging new ideas leading to advances in surgery. Each year the Forum hears papers by younger men whose independent and original research adds to existing knowledge in the field. The Forum will begin Monday and continue through Friday, with fifteen sessions in all. Dr. Owen H. Wagensteen, Professor of Surgery, University of Minnesota Medical School, is chairman of the Surgical Forum Committee.

MINNESOTA PUBLIC HEALTH CONFERENCE

Problems of old age and rehabilitation will be featured at the Minnesota Public Health Conference this year. The conference will meet October 2 and 3 at the St. Paul Hotel, St. Paul, and is open to anyone interested in public health. Minnesota physicians who will participate in talks and panels include Dr. E. L. Tuohy, Duluth; Dr. Franklin Top, professor in the School of Public Health, University of Minnesota; Dr. James P. O'Keefe, St. Cloud; Dr. Robert N. Barr and Dr. D. S. Fleming, Minnesota Department of Health; Dr. Russell H. Frost, superintendent of Glen Lake Sanatorium; Dr. Walter P. Gardner, St. Paul; Dr. Mary E. Giffin, Dr. V. O. Wilson and Dr. Charles Scheard, Rochester; Dr. S. A. Whitson, Albert Lea; Dr. E. A. Kilbride, Worthington; Dr. E. C. Bayley, Lake City; Dr. H. A. Roust, Montevideo; and Dr. G. S. Boyer, Crookston. Dr. D. R. Gillespie, past president of the St. Paul Health Council, will be toastmaster at the annual banquet on Thursday evening, October 2.

CONTINUATION COURSES

Tuberculosis for Lay Persons.—The University of Minnesota in conjunction with the Minnesota Public Health Association will present a continuation course in Tuberculosis for Lay Persons particularly interested in this field. The course will be held at the Center for Continuation Study on the University of Minnesota campus from October 27 to 29, and emphasis will be placed on the public health aspect of tuberculosis.

Chest Diseases.—A continuation course in Treatment of Diseases of the Chest will be presented by the University of Minnesota in conjunction with the American College of Chest Physicians and the Minnesota Chapter of the American Trudeau Society on October 16-18, 1952, at the Center for Continuation Study.

Intended primarily for physicians engaged in general practice, emphasis will be placed on the treatment of the various types of pulmonary disease. Guest participants include two outstanding authorities in this field: Dr. Arthur J. Vorwald, director of the Trudeau Foundation and the Saranac Laboratory, Saranac Lake, New York, and Dr. Paul A. Bunn, professor, Department of Medicine, State University of New York, Syracuse. Dr. Vorwald will also address the American Trudeau Society on Friday evening, October 17, when he will discuss "The Effects of BCG Vaccination in Silicotic Animals."

The remainder of the faculty for the course will consist of members of the clinical and full-time staff of the University of Minnesota Medical School and the Mayo Foundation.

Clinical Chemistry.—The University of Minnesota will present a course in Clinical Chemistry for Medical Technologists on October 7 and 8, 1952, at the Center for Continuation Study. Presented under the direction of Dr. Gerald T. Evans, director of hospital laboratories, the program will emphasize methods for the determination of electrolytes and the clinical application of these methods. The use of radioactive isotopes in medicine will also be discussed.

The faculty will include members of the staff of the University of Minnesota Medical School.

Of General Interest

Dr. James Rogers Fox, of the University of Minnesota Medical School and the Health Service, has returned from Europe after several months. While he was in Europe, he made his headquarters in Scotland where he was a member of the faculty of Internal Medicine at the University of Edinburgh. In addition, Doctor Fox participated in the postgraduate course in Internal Medicine at Edinburgh; addressed a meeting of members of the British and Irish Medical Associations in Dublin; and was the guest speaker of the annual meeting of the British Health Officers which was held in Nottingham.

He had the opportunity of observing methods employed in leading medical schools, health services, hospitals, and industrial medical centers throughout the British Isles and on the European mainland. However, the unique feature was that Doctor Fox was made a member of the British Medical Council Registry and as such participated in the National Health Service. This gave him first-hand experience in socialized medicine which he intends to discuss when he resumes his weekly radio health talks.

* * *

Dr. Louis A. Buie, professor of surgery in the Mayo Foundation, was presented with the 1952 Alumni Honor Award and Gold Key by the Medical Alumni Association of the University of Maryland "for outstanding contributions to medicine and distinguished service to mankind." The presentation was made June 5, when Dr. Buie addressed the association on "The Fruit of Loyal Nature and of Noble Mind."

* * *

Dr. James L. Jaeck, University of Minnesota '37, recently completed his residency in Pathology under Dr. E. T. Bell at the Veterans Administration Hospital in Minneapolis. Dr. and Mrs. Jaeck (Evangeline Langhoff, Minnesota '40), and their three children will reside in La Crosse, Wisconsin, where the doctor has accepted an appointment as Pathologist and Director of Laboratories of the Gundersen Clinic and La Crosse Lutheran Hospital. Dr. Jaeck was in general practice in Minneapolis for several years and served in World War II as a Lt. Commander in the U. S. Naval Reserve.

* * *

Following his discharge from service in the U. S. Navy, **Dr. F. H. Koenecke,** formerly of Ceylon began general practice at Lakefield on July 1, where he is associated with **Dr. Victor W. Doman.**

* * *

Dr. Walter R. Ramsey, St. Paul, has contributed a chapter to the *Encyclopedia Arctica,* which is to be published in the near future. Entitled "Pembina and Pemmican," it tells about the ox carts that plied between St. Paul and Pembina up on the Canadian border prior to motorized travel. Pemmican, of course, is the dried buffalo meat that was a common source of sustenance for travelers in unsettled areas in pioneer days.

* * *

Announcement has been made of the affiliation of **Drs. Charles E. Rea** and **Frederick M. Owens** in the practice of surgery, with offices at 962 Lowry Medical Arts Building, St. Paul.

* * *

Dr. Martin E. Janssen, a diplomate of the American Board of Internal Medicine is now associated with **Dr. Joseph N. Gehlen** and **Dr. Frank J. Milnar** in the practice of internal medicine. Their offices are at 714 Lowry Medical Arts Building, St. Paul.

* * *

The American Board of Internal Medicine has certified **Dr. J. Gordon Beaton,** who is a member of the Fritsche Clinic in New Ulm.

* * *

The Commission on Chronic Illness, located for the past two years in Chicago, where it has been occupying office space donated by the AMA, moved to Baltimore on July 1, 1952. In Baltimore the Commission will be housed in offices provided through the generosity of Johns Hopkins University School of Hygiene and Public Health.

The AMA is one of four organizations that founded the Commission in 1919 and it has, and will continue to, contribute substantial financial support for its program. **Dr. Dean W. Roberts** has been appointed director of the Commission, and **Peter G. Meek,** who has been serving as acting director, has assumed the duties of assistant director. **Dean E. Krueger** will continue as program analyst.

* * *

Dr. Lyle Benson, recently released from military service after 14 months with the Viking Division at Camp Rucker, Alabama, has resumed his practice at Tracy. At the time of his separation from the Army in May, Dr. Benson was commanding officer of the Twentieth Clearing Company, Tracy Guard unit. Previously he had been division sanitary officer.

* * *

The AMA House of Delegates officially abolished fellowship in the Association at the June session in Chicago. Provision has been made for service, affiliate and honorary fellowships to be incorporated in the membership classification. All candidates for membership in the Association will be screened by the Judicial Council prior to acceptance.

* * *

Announcement has been made of the election of **Dr. Northrup Beach,** Minneapolis, as a fellow of the American Academy of Pediatrics.

Why Should You Own Municipal Bonds?

BECAUSE—

Your money is invested in a class of security that has been proved to be second only to U. S. Government bonds in certainty of payment.

It has been authoritatively reported that less than 2% of all municipal issues defaulted during the depression and nearly all of these were cleared up without loss of principal.

BECAUSE—

Your money earns an income that is not subject to current federal income taxes —you are not adding to your tax burden from your investment income.

Income from state and municipal bonds has never been subject to the levy of federal income taxes.

BECAUSE—

Your money is securely invested and you need not be concerned with "Day-to-day market fluctuations."

Municipal bond investors buy bonds for interest income to maturity without market worries in the meantime.

BECAUSE—

Your money is invested at a known yield or rate of return.

The income from municipal bonds is not contingent upon the action of a board of directors—semi-annual interest coupons are attached to each bond to be deposited in your bank as they mature.

BECAUSE—

Your money would be invested in a class of security known to conservative investors for many years.

Municipal bonds have been issued in this country since prior to the Revolutionary War. They are actively traded in a market with a greater volume than all bonds traded on the stock exchange.

Dr. John O'Leary, who has been affiliated with the **Dr. Otto Seifert Clinic** at New Ulm, has terminated his practice there to resume his medical studies at the University of Minnesota.

Dr. O'Leary is taking a three years' course in internal medicine and will alternate between the university and the Veterans Hospital at Fort Snelling.

* * *

Effective in July, **Dr. James Doyle** became associated in a partnership with **Dr. H. A. Wente** at Rochester.

A graduate of the University of Minnesota, Dr. Doyle is a native of Owatonna. Following the completion of his university course in 1949, he joined the Army Medical Corps and has been in service for the past three years. With the rank of captain, his last assignment was as commandant of the 33rd Station Hospital at Bordeaux, France.

Dr. Wente, who began his practice at New Ulm three years ago, was a classmate of his new partner at St. Thomas College and the University of Minnesota.

* * *

In complement to his forty years of service on the faculty of the University of Minnesota Medical School, **Dr. Moses Barron** was guest of honor at a dinner given by fellow faculty members on June 28.

Dr. Barron retired as professor emeritus of medi-

cine on July 1, but he is continuing private practice. He joined the school in 1912 as a demonstrator in pathology and bacteriology and was made an instructor the following year. In 1917 he was appointed an assistant professor and a full professor in 1933.

* * *

Dr. Milton Plucker has opened offices for general practice at Storden. A native South Dakotan, Dr. Plucker recently completed his internship at Omaha, Nebraska.

* * *

Dr. and Mrs. Louis A. Brunsting, of Rochester, sailed on the *S. S. Mauretania* for Europe in June. Dr. Brunsting, who is a member of the dermatology section at the Mayo Clinic, presented a paper at the International Congress of Dermatology and Syphilology held in London in July.

Before returning home, Dr. and Mrs. Brunsting will visit in England, Scotland, Germany, Holland and Sweden.

* * *

Dr. Robert Molenaar has engaged in practice at Cannon Falls, where he is located in the offices formerly occupied by **Dr. George Bagby** in the Lukach Building.

A 1951 graduate of the University of Minnesota, Dr. Molenaar recently completed his internship at Ancker Hospital, St. Paul.

* * *

Announcement has been made of the appointment of **Dr. David Struxness** to the Alexandria Clinic, where he will be associated with **Drs. L. F. Wasson, C. E. Carlson, G. W. Clifford, P. M. Geiser** and **H. L. Stemsrud.**

Dr. Struxness is a native of North Dakota, but he grew up at Belgrade, Minnesota. Prior to entering the University of Minnesota, where he received B.S. and M.D. degrees, he had taken a Bachelor of Theology degree at Luther College. Since his completion of his medical course at the the university a year ago, he has been a member of the staff at the General Hospital in Minneapolis.

* * *

A permit for construction of a clinic building on East Broadway at Little Falls has been issued to **Dr. Glenn P. Schmitz.** A modern one-story brick building, it will be approximately 25 by 75 feet in area. Construction was started in July, but Dr. Schmitz does not expect it to be ready for occupancy until early next spring.

* * *

Although Gaylord is only 1,050 in population the community is assured of the best of medical care by a twenty-bed hospital which was opened this spring and a new clinic building recently completed by **Dr. D. C. Olson.**

Equipped with modern x-ray facilities, the clinic includes a laboratory, two examination rooms, with dressing rooms adjoining, a pediatrics room, a combination treatment-recovery room, offices and reception room.

Dr. Paul F. Meyer, Faribault, has announced his affiliation with **Dr. Robert P. Meyer,** recently of Chicago, in the practice of medicine and surgery.

A graduate of the University of Minnesota School of Medicine, Dr. Robert Meyer also studied at Harvard University. His internship was served at the Presbyterian Hospital, Chicago, where he had four years of resident training in general surgery. He is a member of the American College of Surgeons, a candidate of the American Board of Surgery and was formerly on the faculty of the University of Illinois School of Medicine, Department of Surgery.

Dr. Meyer has done considerable research in both general and thoracic surgery and he was a member of the Chicago Thoracic Surgical Society and the Chicago Medical Society.

* * *

The American Board of Internal Medicine has announced certification of **Dr. John G. Rukavina,** of St. Paul.

Following his graduation from the University of Minnesota, Dr. Rukavina enlisted in the Army Medical Corps, where he held the rank of captain. On completion of his internship at St. Mary's Hospital, Duluth, he was appointed resident physician.

* * *

The summer quarterly bulletin of the **Mayo Clinic and Foundation** reports the appointment of seven new consultants at the Clinic. They are **Drs. Paul M. Brickley, Edward C. Clark, Henry W. Dodge, Jr., William T. Foulk, Ward S. Fowler, Richard A. Groat,** and **R. Drew Miller.**

Dr. Brickley received his medical degree in 1943 and was later in active service in the Army Medical Corps. In July, 1948, he was admitted as a fellow in opthalmology at the Mayo Foundation and received an M.S. degree in ophthalmology from the University in 1952.

Dr. Clark was graduated in medicine in 1943 and later served in the Army Medical Corps. He has been assistant professor of neurology at the University of Iowa College of Medicine since 1949.

Dr. Dodge received his M.D. degree in 1943 and shortly afterward was assigned to active duty in the Army Medical Corps. In 1948 he entered the Mayo Foundation as a fellow in neurosurgery and received an M.S. degree in June, 1951.

Dr. Foulk received his medical degree in 1942. He served in the Army Medical Corps and entered the Mayo Foundation on October 1, 1947, and received an M.S. degree in medicine from the University of Minnesota in 1950.

A 1941 graduate of the Harvard Medical School, Dr. Fowler was in active service in the Army. Since 1947 he has been a member of the staff of the department of physiology at the University of Pennsylvania Graduate School of Medicine.

Dr. Groat received a Ph.D. degree in 1941 and was anatomy instructor at Emory University in 1941 and 1942; at Oglethorpe University in 1943. From there he went to Northwestern University as an associate in neurology, and later assistant professor of neurology until 1946. He then was made assistant professor of histology and neuroanatomy and finally professor of anatomy and director of the department of anatomy at Bowman Gray School of Medicine, where he received his medical degree in 1952.

A veteran of the Navy Medical Corps, Dr. Miller received his medical degree in 1945. He entered the Mayo Foundation in October, 1948, and received an M.S. degree in December, 1951.

* * *

Announcement has been made by the Olmsted County Community Council—an organization for promotion of youth programs—of the election as president of **Dr. H. F. Helmholz,** of Rochester. Formerly head of pediatrics at the Mayo Clinic, Dr. Helmholz served as chairman of President Truman's White House Conference on Children and Youth in 1950.

* * *

Dr. J. L. Bader, who received his medical degree at the University of Nebraska in June, 1951, has joined the staff of the Slayton Clinic at Slayton. The other members are **Dr. R. F. Pierson** and **Dr. Dean D. Nywall.**

A Navy veteran of World War II, Dr. Bader spent two and a half years of four and a half years stretch in the Pacific Theater. He is a native of Nebraska City and his internship was served at the Clarkson Hospital in Omaha.

* * *

Roy T. Pearson, formerly on the staff of the Veterans' Hospital at Fort Snelling, has moved from Shakopee to Spokane, Washington, where he will be associated with the Veterans' Hospital.

* * *

The **Moorhead Clinic** has announced the addition of two more physicians to the staff. They are **Dr. Vernon Carlson,** of South St. Paul, and **Dr. E. W. Humphrey, Jr.,** son of **E. W. Humphrey,** of the Clinic.

Both general practitioners, they received their medical degrees from the University of Minnesota in 1952 and interned together at General Hospital, Minneapolis.

Dr. Carlson served as a lieutenant (jg) in the Navy for three years during World War II, with assignment in the Pacific Theater.

Also a veteran of World War II, Dr. Humphrey spent six months in the Counter Intelligence Corps, six months in the Infantry, and attended a Japanese language school for a year.

* * *

Dr. Wallace E. Anderson, of Minneapolis, where he was born and grew up, opened offices at Lakeville on July 1. A veteran of World War II, Dr. Anderson served for forty-one months as a weather meteorologist in the Air Force. He began his study of medicine at the University of Illinois, but transferred to the University of Minnesota, where he was graduated in June, 1951. His internship was served at Ancker Hospital, St. Paul.

Dr. Anderson is a member of the staffs of the Deaconess Hospital, Minneapolis and the Sanford Hospital at Farmington. At Lakeville he replaces **Dr. Kenneth E. Stein,** who has gone to Pierz to be associated in practice with his brother, **Dr. Raymond J. Stein.**

* * *

Dr. Milo Hanson, formerly of Glendive, Montana, has joined the Little Falls Clinic, where he will have charge of internal medicine patients. The other members of the staff are **Dr. George Heine,** obstetrician and pediatrician, and **Dr. G. M. A. Fortier,** surgeon.

Commissioned an ensign, Dr. Hanson served in the U. S. Navy from 1943 until the end of the war and was in active combat duty in the Pacific Theater. After his separation from service, he entered the University of Minnesota and was graduated. He interned at Ancker Hospital, St. Paul.

* * *

In recognition of his outstanding service to the Church, society, and the Holy See, **Dr. Francis J. Schatz,** of St. Cloud, has been made a member of the Order of St. Gregory the Great by Pope Pius XII. Carrying the rank of knighthood, this is the highest honor conferred by the Vatican on laymen.

A native of Montgomery, Minnesota, Dr. Schatz attended St. Thomas College, St. Paul, from 1900 to 1905. In 1905 and 1906 he was at Creighton University, Omaha, Nebraska, and received his medical

degree from Jefferson Medical School in Philadelphia in 1909.

He began his practice at Turtle Lake, Wisconsin, in 1910; moved to Rosemount, Minnesota, in 1912 and was in practice there until 1920, excepting for one year's absence for Army service in World War I. He moved to St. Paul in 1920 and a year later established his offices at St. Cloud.

Dr. Schatz has done postgraduate work in obstetrics at the Chicago Postgraduate School, Chicago Lying-in Hospital, Washington University, Tulane University and the Maternity Hospital at the University of Minnesota.

Since locating at St. Cloud, Dr. Schatz has delivered 7,700 babies—more than half of them in homes.

* * *

Dr. J. A. Malerich, St. Paul, has returned from Denver, where he has been studying at the University of Colorado for the past year. Dr. Malerich, who was in practice on the West Side for a number of years, has reopened his offices there in association with **Dr. E. A. Johnson.**

* * *

Announcement has been made of the appointment of **Dr. Arthur T. Hertig,** a former Minnesotan, as Shattuck professor of pathology at Harvard University Medical School.

Dr. Hertig, who is pathologist and senior obstetrician at the Lying-in Hospital at Boston, Massachusetts, was awarded a medal for outstanding achievement at the University of Minnesota Centennial exercises in 1950.

In his new appointment, the doctor will be mainly concerned with teaching and research. His research career dates back prior to his graduation from the university in 1928, when, at 21, he went to China as an entomologist to do research on fly-borne diseases.

* * *

Retirement in July terminated 34 years of association with the Mayo Clinic for **Dr. John de Jarnette Pemberton**—a tenure of service exceeded by only two other members of the Clinic. They were **Dr. H. W. Meyerding,** who was there for thirty-eight years and **Dr. D. C. Balfour,** 37 years. A general surgeon, Dr. Pemberton was particularly interested in surgery of the thyroid gland.

Born on May 3, 1887, in Wadesboro, North Carolina, Dr. Pemberton graduated from the University of North Carolina and received his medical degree from the University of Pennsylvania in 1911. After interning at the Protestant Episcopal Hospital in Philadelphia, he came to the Mayo Clinic as a fellow in surgery on May 1, 1913. The following year he was appointed first assistant in surgery and on January 1, 1918, was made head of a section on surgery. That same year he received an M.S. degree in surgery from the University of Minnesota.

Since 1936 he has filled the post of professor of surgery in the Mayo Foundation graduate school, University of Minnesota. He was certified as a specialist in surgery by the American Board of Surgery in 1937.

* * *

Dr. Leroy W. Hanson, Minneapolis, is now associated with **Dr. Henry A. Korday** in practice at Pelican Rapids. Formerly a resident of Hallock, Dr. Hanson, who received his medical degree at the University of Minnesota, recently completed a year's surgical training at the Minneapolis General Hospital. During World War II he served for two years in the Army Medical Corps.

* * *

Announcement has been made of the appointment of **Dr. Harold Kletschka,** recently surgeon with the Bratrud Clinic at Thief River Falls, to the surgical staff of the New York University Medical Center, New York City, where he assumed his duties in July.

A graduate of the University of Minnesota Medical School, Dr. Kletschka served his internship and had one year of surgical training at Kings County Hospital, New York City. From there he went to the University of Michigan, where he did postgraduate work in general and thoracic surgery for two years.

* * *

Dr. James A. Nesse, formerly of Thief River Falls, has joined **Dr. Paul C. Leck** in medical practice at Austin, with offices in the Medical Building at 605 N. Main Street.

Dr. Nesse took his pre-medical work at St. Olaf College, Northfield, where he graduated in 1941. He then enlisted in the Air Force and completed 35 missions as a bomber pilot in the ETO. Following his separation from service, he enrolled at the University of Minnesota and received his medical degree in 1949. His internship was served at Brook General Hospital, San Antonio, Texas. Recalled to military duty as an officer in the Air Force Medical Corps, Dr. Nesse served fourteen months in England, Japan and Korea. Following his discharge from service, he did nine months of postgraduate study at the University of Colorado and the Denver General Hospital.

* * *

The clinic at Gibbon, which was closed for ten months, leaving the community without a resident physician, has been reopened by **Dr. A. Raynor** and **Dr. B. Racer,** both recent graduates of the University of Minnesota Medical School.

Dr. Racer is a native of St. Paul, and Dr. Raynor comes from Des Moines, Iowa.

* * *

Drs. W. T. Nygren and **E. F. Beyer,** Braham, are now located on the ground floor of a building purchased by Dr. Nygren last March and which he has had remodeled to accommodate the needs of modern medical practice. Formerly, the doctor's offices were located on a second floor and patients had to climb a stairs to reach them.

Consisting of eleven rooms—offices, laboratory, x-ray room, lavatories, and closets—the new quarters are completely air-conditioned.

The change of location also effected a change in name to the "Braham Clinic."

* * *

Offices for part-time practice of medicine in Floodwood were opened on July 15 by **Dr. Arnold I. Rajala,** of the Itasaca Clinic at Grand Rapids. A native of Cromwell, Dr. Rajala received his medical degree from the University of Minnesota in 1951, completed a year's internship at the Minneapolis General Hospital on July 1, and joined the Itasca Clinic on July 10. A veteran of World War II, he served in the Army Intelligence on Okinawa for three years.

* * *

Dr. Herman Miller, physician and surgeon, of Worthington, has moved to Grand Meadow, a community that has been without medical service since the death of **Dr. A. W. Eckstein** a year ago.

* * *

Effective July 1, **Dr. Milton Kaiser** became associated in practice with **Dr. Howard Vogel** at his clinic in New Ulm.

A native of Humboldt, Nebr., Dr. Kaiser is a veteran of World War II, and it was while on assignment with the combat engineers that the idea of studying medicine first occurred to him. Following his separation from service in 1946, he returned to the University of Nebraska to take his medical training. He interned at Miller Hospital, St. Paul.

Dr. Louis J. Wilson, has joined his father, **Dr. R. H. Wilson,** in medical practice at Winona.

Dr. Wilson received his M.D. degree at the University of Minnesota in June, having entered the medical school in 1947 and interned at St. Joseph's Hospital in St. Paul.

Born in Minneapolis on April 19, 1923, Dr. Wilson graduated from high school at Winona, then entered Grinnell College, Grinnel, Iowa, where he studied for two years. The summer and fall semesters of 1943 he spent at the University of Minnesota, prior to going on active duty in the Navy in January, 1944. As an ensign, Dr. Wilson served on an aircraft carrier in the Pacific Theater until April, 1946.

* * *

Dr. Roger L. Anderson, who recently completed his internship at the Minneapolis General Hospital, has returned to his home town, Detroit Lakes, to practice in association with **Dr. William C. Dodds.** Dr. Anderson took his medical degree at the University of Minnesota.

* * *

Dr. L. W. Barry and **Dr. Nora Winther** (Mrs. Barry) recently returned from Europe where they attended the meeting of the International College of Surgeons—the main meeting in Madrid and sectional gatherings in Bordeaux, Barcelona, Lisbon and Vienna—and visited with Dr. Barry's daughter, Helen (Mrs. Harry Skornia) in Vienna. Mr. Skornia is with the State Department there. They also visited in England.

Announcement has been made of the establishment of a medical partnership consisting of **Dr. W. H. Barr,** of Wells, and his son **Dr. James Barr.**

A 1951 graduate of the University of Minnesota, Dr. Barr completed his internship at Ancker Hospital in St. Paul on July 1.

* * *

The offices vacated by **Dr. Merton Johnson** at Storden have been leased by Dr. Milton W. Pucker, who took over July 1.

Thirty-one years old, Dr. Pucker is a native South Dakotan. He began his medical studies at the University of South Dakota School of Medicine, but completed them at the University of Nebraska, where he was graduated in May, 1951. During World War II he served three and a half years in the Air Force Medical Corps.

* * *

Thirty-two years of practice and on the job every day is the unusual record of **Dr. A. W. Graham,** of Chisholm, where he came in 1908 after answering an ad in a medical journal for a young doctor at the Mesabi Clinic. On the day he arrived, only the school and church were standing, as the rest of the community lay in ruins as the result of a devasting forest fire. Though sorely tempted to go back east, Dr. Graham stayed on and helped get Chisholm back in shape.

In 1917, Dr. Graham was appointed school physician, but he has always done more than just examine the school children; he sees that they get proper care.

An outfielder with the New York Giants prior to entering medical practice, Dr. Graham is still a fan and played until eight years ago. Once a year he goes back to North Carolina, where his brother Frank was formerly president of the University, but is now a UN mediator in the Kasmir dispute between Pakistan and India.

During his 32 years of practice at Chisholm, Dr. Graham has made fifty-five trips to Rochester, so as to keep in touch with medical advances.

* * *

Dr. William F. Skaife, who recently completed his internship at Northwestern Hospital in Minneapolis, has joined **Drs. D. L. Johnson, A. H. Benson** and **Robert A. Stoy** in practice at Little Falls.

The son of Sam Skaife, druggist at Staples, Dr. Skaife took his pre-medic work at St. John's University at Collegeville and received his medical degree from Albany Medical College, Albany, New York in 1951.

* * *

A change of name has been reported by the **Estrem Clinic,** Fergus Falls, to the **Park Region Medical Center.** A new clinic building is now under construction and will be ready for occupancy this fall.

Members of the staff are Dr. Carl O. Estrem, Dr. Emmett A. Heiberg, Dr. Glenn J. Mouritsen, Dr. Carl J. Lund, Dr. Robert D. Estrem, Dr. Ralph Estrem and Dr. Rolf Daehlin.

* * *

The AMA Council on National Emergency Medical Service has announced availability of a booklet, **Medical Aspects of Civil Defense,** which covers the medical problems involved in civil defense. Included are items on civil defense organization, medical aspects of biological warfare, chemical defense, atomic burn injury, nature of air-raid casualties, mental health and atom-bomb injury.

Copies are being distributed to all chairmen of state emergency medical service committees. Additional copies, at 25 cents each, can be obtained from the Council on National Emergency Medical Service of the AMA.

* * *

Dr. Harold Thysell, formerly of Moorhead is now practicing in Crookston where he is associated with the Crookston Clinic.

A veteran of World War II, Dr. Thysell was a fighter pilot on assignment with the Air Force in Italy. He received his medical degree from the University of Minnesota in 1951 and, until locating at Crookston, was an intern at Ancker Hospital in St. Paul.

* * *

Stella Elizabeth Delavan, daughter of the late Dr. Philip Delavan of Saint Paul, has won a scholarship to the University of California and will study medicine. She is the granddaughter of the late Dr. Owen McKeon of Saint Paul.

* * *

At the commencement convocation of the University of Minnesota which was held in Minneapolis July 24, at 8:00 o'clock, the following physicians were awarded degrees for work done in the **Mayo Foundation:** Dr. N. C. Hightower, Jr., Ph.D. in Physiology; Dr. R. C. Knutson, M.S. in Anesthesiology; Drs. W. G. Bannon, A. W. Robinson and D. A. Scholz, M.S., in Medicine; Dr. J. H. Webb, M.S., in Neurosurgery; Dr. C. L. Lay, M.S., in Obstetrics and Gynecology; Drs. W. H. Benedict and P. M. Brickley, M.S., in Ophthalmology; Drs. D. L. Becker, R. A. Seale and L. A. Stapley, M.S., in Pathology; Drs. A. S. Anderson and J. B. Seagle, M.S., in Pediatrics; Drs. H. A. Johnson and J. K. Masson, M.S., in Plastic Surgery; Drs. J. C. Carlisle, H. R. Stowe and E. A. Swift, M.S., in Surgery, and Drs. K. O. Ghormley, J. R. Longley, E. J. O'Shaughnessy and R. E. Wineland, M.S., in Urology.

HOSPITAL NEWS

Announcement has been made of the appointment of **Dr. John Reitmann,** superintendent of Sandstone State Hospital, as temporary superintendent of the Anoka State Hospital.

According to Jarle Leirfallom, acting state director of public institutions, Dr. Reitmann, who is the

youngest superintendent in Minnesota mental hospitals, had requested that he be relieved of his duties at Sandstone, in order to continue psychiatric study at Rochester State Hospital. However, because of the emergency which resulted from the death in July of **Dr. Edmund Miller,** superintendent at Anoka for the past nine years, Dr. Reitmann will be in charge of both Anoka and Sandstone until a permanent superintendent can be secured.

* * *

The Community Hospital elected **Dr. Kenneth March** of Cambridge as chief of staff at the regular meeting in June. Other officers elected at this time are **Dr. Gerald Larson,** of Cambridge, vice president, and **Dr. Gordon Tesch,** of Elk River, secretary-treasurer.

Marianne Borglin, of St. Paul, joined the staff as x-ray technician on June 18.

* * *

The **Appleton Municipal Hospital** was officially opened on July 3, when the dedication services were attended by 1,750 persons. The program included addresses by **Dr. Fred W. Behmler,** of Morris, formerly in practice at Appleton and now president of the State Board of Health; **Dr. Roger Kennedy,** president of the State Medical Society; **Dr. Robert Barr,** deputy executive officer of the State Department of Health; and **Dr. Helen Knutson,** director of the division of hospital services, State Department of Health. Miss Lucy Wells, hospital administrator was presented with the key to the hospital by the architect.

Admittance of patients began on July 5, with the transfer of those who had been in Kauffman Hospital, which has served the community since Christmas, 1918. Kauffman has been closed and the village has sold the building.

BLUE CROSS-BLUE SHIELD

Minnesota Blue Shield Progress.—That Blue Shield is playing an increasingly important role in the economic phases of medical practice in Minnesota is shown from some of the statistical analyses contained in the 1951 Annual Report of Minnesota Medical Service, Inc., recently released. For instance, during the past year enrollment has increased one-fourth, payments of benefits to doctors for subscribers have increased almost one-half, and the proportion of costs of medical, surgical and obstetrical benefits have maintained practically the same previous ratio. Besides these facts, other analyses show growth, progress and increasing importance of Blue Shield in medical practice.

Persons covered or protected by Blue Shield increased 27.3 per cent during 1951. On January 1, 1951, 411,733 people were participant subscribers, whereas on December 31, 1951, this number had increased to 524,257. It is interesting to note further that 68,000 persons have single contracts while the family contracts total 128,000, giving a total of almost 200,000 contracts in effect. This portrays remarkable growth in the slightly more than four years during which Blue Shield has been in operation in Minnesota.

Increasing economic value of Blue Shield to the medical profession is evident in that the amount paid to doctors in claims has increased from $2,200,000 during 1950, to almost $3,100,000 in 1951. This represents an increase of 50 per cent during a period of only one year. Also, the total payment of over $6,600,000 in claims during a period slightly in excess of four years is remarkable.

Of further interest are the amounts paid during 1951 for different types of services. As shown in the report, surgical claims of $1,800,000, obstetrical claims of $559,000, medical claims of $518,000 and such ancillary claims as x-ray, endoscopy and anesthesia amounting to $140,000 were paid during 1951. These figures represent a 78 per cent increase in the number of obstetrical claims, and a 35 and 19 per cent increase in the number of surgical and medical claims respectively. In this regard it is also pertinent that claims cost increased 4.4 per cent per contract during 1951; that is, it increased from $16.54 per contract in 1950 to $17.26 per contract in 1951.

In other reports made concerning Blue Shield during the last meeting of the Minnesota State Medical Association, it was stated that in its first four years Blue Shield has increased benefits on four different occasions. These benefit or fee increases have consisted of raising the appendectomy fee from $75 to $100, increasing the tonsillectomy fee from $25 to $30 for children under thirteen years of age, initiating emergency medical care at daily rates above routine medical care, and establishing a more liberal policy of paying home and office calls for surgical treatment of wounds. In addition to these benefit increases, predictions have been made that many more fee increases will be announced in the near future. By comparison with the remaining seventy-five or more Blue Shield plans of the country, this record of increasing fees or benefits is second to none.

New Blue Cross-Blue Shield Radio Program.—For over a year Cedric Adams has continued to prove his worth as "Good Will Ambassador" for Minnesota Blue Cross-Blue Shield, first in a limited way on radio spot announcements and, since last December, on the popular and effective "Dinner At The Adams" half-hour Friday night program over WCCO-CBS. During this period, in addition to immeasurable service in building good will for Blue Cross-Blue Shield, Cedric has achieved very tangible results in securing over 12,000 inquiries, many of which have been converted into new Blue Cross and Blue Shield subscriber contracts.

Therefore, commencing Sunday, June 29, the Cedric Adams' WCCO radio presentation "Musical Guests" has been adapted to include three fifteen-minute programs per week (rather than one-half hour show) according to the following schedule:

Sunday	7:00-7:15 p.m.
Tuesday	6:30-6:45 p.m.
Thursday	6:30-6:45 p.m.

Further, in line with an idea formulated earlier in the year and as a further extension of the "dinner guest" idea, Cedric Adams' show has been changed to include music and top personalities of the entertainment world. Hence the new name for the show will be Cedric Adams' "Musical Guests." Each program will now be a personal and musical interview between Cedric Adams and one or more of the nation's top personalities of the musical or entertainment world. Some idea of the caliber of Cedric's guests can be gained by looking at the listing of stars scheduled to appear on forthcoming programs; they are Dinah Shore, Eddie Arnold, Rosemary Clooney, Tony Martin, Ginny Sims, Jo Stafford, Curt Massey, Jack Smith, June Hutton, Jack Owens, George Shearing and Paul Weston, to name only a few.

This type of wholesome, popular, musical entertainment is made possible only through a combination of Cedric Adams' nationwide friendship with celebrities, plus the desire on the part of these famous stars to co-operate with Blue Cross-Blue Shield on a public service basis. Otherwise such a superlative presentation of talent would be beyond the limited budget available to a service organization such as Blue Cross-Blue Shield.

It is apparent that these radio presentations, coupled with Cedric Adams' sincere and informative Blue Cross-Blue Shield messages to the public, will continue as a powerful magnet, winning and keeping many new friends for Minnesota Blue Cross-Blue Shield.

BOOK REVIEWS

Books listed here become the property of the Ramsey, Hennepin and St. Louis County Medical Libraries when reviewed. Members, however, are urged to write reviews of any or every recent book which may be of interest to physicians.

FUNDAMENTALS OF PSYCHIATRY, by Edward A. Strecker, M.D., Sc.D., LL.D., Litt.D., F.A.C.P. Professor of Psychiatry and Chairman of the Department, Undergraduate and Graduate Schools of Medicine, University of Pennsylvania; Psychiatrist to the Pennsylvania, Philadelphia and Germantown Hospitals; Consultant and Chief-of-Service, Institute of the Pennsylvania Hospital; Consultant to the Surgeons General, U. S. Army and U. S. Navy, and formerly Consultant for the Secretary of War to the U.S.A.A.F.; Senior Consultant in Psychiatry, Veterans Administration; Consultant in Mental Hygiene, U.S.P.H.S.; Chairman, Committee on Psychiatry, National Research Council; Chairman, Committee on Psychiatry, American National Red Cross. 5th ed. 250 p. Illus. Cost $4.50. Philadelphia: J. B. Lippincott Co., 1952.

The fifth edition of this standard textbook of psychiatry is intended for all branches of the medical profession. Almost every phase of psychiatry is touched upon in the space of 237 pages.

The various diagnostic types of personality disturbance are presented descriptively. An attempt is made to explain some of the dynamic forces which are responsible for or are associated with a particular diagnostic category. The material presented is not controversial. Most readers should have little difficulty accepting the author's interpretations so far as they go.

As an introduction for those who have had little experience in psychiatry, the book has real value. The more experienced reader will find the book unsatisfying.

There is a helpful glossary of psychiatric terms.

Robert P. Bush, M.D.

CALCULATION OF INDUSTRIAL DISABILITIES OF THE EXTREMITIES. By Carl O. Rice, M.D., M.S., Ph.D., F.A.C.S., Clinical Associate Professor of Surgery, University of Minnesota Medical School Surgical Staff, St. Barnabas Hospital, Minneapolis, Minnesota. Drawings by Jean E. Hirsch. 289 p. Illus. Price $10.50. Springfield, Ill.: Charles C Thomas, Publisher, 1952.

This book will be of inestimable value to industrial surgeons. How to calculate industrial disabilities is given in a clear, simple manner. There is scarcely a disability that is not discussed and estimated, singly and in combination with other injuries. The illustrations are excellent, the type readable and the index complete. This volume is considered by this reviewer to be one of the best written to date on this subject.

APHORISMS OF DR. CHARLES HORACE MAYO (1865-1939) AND DR. WILLIAM JAMES MAYO (1861-1939). Collected by Fredrick A. Willius, M.D. 117 p. Price $2.75. Springfield, Ill.: Charles C Thomas, Publisher, 1951.

When one thinks of Medicine in Minnesota, one thinks of her most famous sons, Will and Charlie Mayo. Dr. Willius has collected a number of aphorisms of the

"kid stuff"

Today's young "sprouts" are demanding more and more of their eyes. Audio visual aids, school work, daily routine, and entertainment media team up to bring constant strain to their priceless vision. It's all a part of every carefree day.

But *guarding the future* of these young eyes cannot be considered "Kid Stuff." For almost 40 years Benson's have worked with better eye doctors transforming the prescriptions of their youthful patients into glasses that will assure better vision throughout the lifetime ahead.

ATlantic 5445 Minneapolis

Doctors Mayo, which show what great surgeons, humanitarians they were.

For some reason, Dr. Willius has seen fit to include the "lost oration" of Dr. Will Mayo before a committee of the Minnesota State Legislature on March 22, 1917, concerning the continuation of the affiliation of the graduate school of the University with the Mayo Foundation for medical education and research. At the time, the incident assumed the proportions of an international crisis; now to us of a later generation, the whole affair seems like the plot of a comic opera. It is akin to the case of the married couple where her folks at first do not approve of his; later when the union has been happy and fruitful, to bring up the past is not only distasteful but a little embarrassing.

There is a need for a book showing the development of the Mayo Brothers as surgeons. Some of this is given in the Clapesattle's, "The Doctors Mayo," but it is lost in the discussing of the family life, the development of the Clinic, et cetera. If Dr. Willius could do as well with the above subject as he has with the aphorisms, it will have a wide appeal.

RX FOR MEDICAL WRITING. A Useful Guide to Principles and Practice of Effective Scientific Writing and Illustration. By Edwin P. Jordan, M.D., and Willard C. Shepard. Price $2.50. Philadelphia: W. B. Saunders Co., 1952.

Dr. Jordan has supplied the material on medical writing and Mr. Shepard the section on illustrations. Both sections supply much valuable information for the physician who contemplates writing to the best of his ability.

The author emphasizes the fact that skill in writing is not a natural gift but is acquired by hard work. He discloses what is probably a secret to many—that the best written medical papers represent industry and numerous revisions.

This small volume is well written and speaks for the experience of both authors. It is a rather brief and well condensed treatise on the subject.

C.B.D.

PATHOLOGY OF THE FETUS AND THE NEWBORN. By Edith L. Potter, M.D., Ph.D., Associate Professor of Pathology, Department of Obstetrics and Gynecology, The University of Chicago; Pathologist, the Chicago Lying-in Hospital; Chief Pathologist, the Chicago Department of Health. 574 p. Illus. Price $19.00. Chicago: The Year Book Publishers, 1952.

Not many years ago, the chief causes of death in infants were listed as pneumonia, status lymphaticus, marasmus, exudation diathesis, and causes unknown. It was only through the accumulated efforts of pathologists like Dr. Potter that reasons for nonsurvival of infants were brought to light.

Like all of Dr. Potter's contributions, this volume is of high excellence. The chapter on the heart and blood vessels is particularly noteworthy. The illustrations throughout the book are exceptional for clarity. This book should have a wide appeal to pathologists, pediatricians and obstetricians. A workable index is appended.

MEDICAL BIOGRAPHIES: The Ailments of Thirty-Three Famous Persons. By Philip Marshall Dale, M.D. 244 pages. Illus. Price $4.00. Norman, Oklahoma: University of Oklahoma Press.

The author, now an internist practicing in Los Angeles, has been interested in medical history throughout his medical career. He has produced an interesting volume, the result of considerable research, in which he has analyzed the ailments of thirty-three famous persons in the light of modern medical knowledge. To anyone who finds history and especially medical history interesting the reading of this volume will prove fascinating and instructive.

After reading this book one is struck by the fact that so many of the great in the past triumphed in spite of physical handicaps often of severe degree. Also one is conscious of the advance in medical science which, through correct diagnosis and treatment, makes much of the suffering of the past unnecessary today.

C.B.D.

ENDOCRINE FUNCTIONS OF THE PANCREAS. By Bernard Zimmermann, M.D., Department of Surgery, University of Minnesota, Minneapolis, Minnesota. 82 p. Illus. Price $2.50. Springfield, Ill., Charles C Thomas, Publisher, 1952.

This monograph is one of the series in the American lectures in endocrinology and is one of the best to date.

AR-EX
HYPO-ALLERGENIC
Cosmetics
Clinically tested on allergic patients for use by allergic patients

Dr. Zimmermann has done a superb job in summarizing the vast literature dealing with the pancreas and the bibliography is amazingly complete for such a small volume. The chapters on the metabolism in diabetes and the action of insulin (chapter III) and the hyperglycemic factor (chapter VI) are excellent. His conclusions (chapter VII) give thoughtful consideration of the direction for future research on the endocrine function of the pancreas.

As usual, Mr. Charles C Thomas, the publisher, has printed a book of which the physical and artistic qualities are of high caliber. This book should have a wide appeal to all medical men.

TULAREMIA, WEATHER, AND RABBIT POPULATIONS. By Ralph E. Yeatter and David H. Thompson. Illinois Natural History Survey Bulletin, Volume 25, Article 6, 31 pages, 29 figures, bibliography.

This publication, a new article of the Bulletin series, includes a brief history of tularemia, and lists the means by which this disease is spread among wildlife species and human beings. It contains a discussion of the relationship in the United States, particularly Illinois, between rabbit populations, weather, and the incidence of tularemia, and offers suggestions for individual and public measures by which the number of tularemia cases among rabbit hunters can be reduced.

Single copies are free on request until the supply runs low. Additional copies are a subject for correspondence. Requests should be addressed to: Illinois Natural History Survey, Dr. Harlow B. Mills, Chief, 172 Natural Resources Building, Urbana, Illinois.

THE HUMAN PELVIS. By Carl C. Francis, A.B., M.D., Assistant Professor of Anatomy, Department of Anatomy, Western Reserve University, Cleveland, Ohio. 210 pages. Illus. Cost $5.50. St. Louis: C. V. Mosby Co., 1952.

Not too often does a reviewer report his impressions of a book with a full sense of pleasure and satisfaction. "The Human Pelvis" by Francis has afforded this reviewer such an experience.

The text provides a wealth of material in the refreshing atmosphere of a small handbook. Compilation of this book must have been motivated by the desire to provide a source of information which had hitherto been lacking on the subject. The author has succeeded in presenting the anatomy of the pelvis in a manner that is easily intelligible to his readers. For the general surgeon as well as for the urologist, gynecologist, and proctologist many details of anatomy which previously had been of little practical import now are brought into full clinical significance. Vague and unrelated anatomical relationships have been clarified and co-ordinated. The chapter on muscles and fascia particularly deserves commendation. In no other text is it possible to find a description of these structures so clearly presented as in this book.

William C. Bernstein, M.D.

AMA BOOKS OFF THE PRESSES

The AMA's Council on Pharmacy and Chemistry announces that new editions of two of its major publications—"New and Nonofficial Remedies" and "Useful Drugs"—will be available this summer. The 1952 edition of "New and Nonofficial Remedies" retails for three dollars postpaid and "Useful Drugs" (15th edition) for $2.50 postpaid. Both may be secured through the publishers, J. B. Lippincott Co., Philadelphia, bookstores, or single copies through the AMA's Order Department.

TIPS FOR THE DOCTOR'S SECRETARY

Practical public relations techniques for dealing with the doctor's patients are included in two new illustrated booklets which the American Medical Association soon will make available to physicians. A twenty-page pamphlet—designed as a brief guide for secretaries—will be sent to all AMA members. Especially valuable as a training guide for girls interested in becoming medical secretaries is the sixty-page detailed manual which was made available July 1 to individual physicians through state medical society offices.

FACTS TO REMEMBER

The Citizens Committee for the Hoover Report on the Reorganization of the Federal Government states that in one unit of the VA there were 24 supervisors in charge of 25 employes. The personnel question assumed added importance when the Federal budget called for the addition of 150,000 employes to the 2,500,000 already on the rolls. Salaries now cost taxpayers about eight billion a year, the Committee reports.

GEORGE J. TWEEDY

Dr. George J. Tweedy, a physician in Winona, Minnesota, since 1893, died July 20, 1952 at his home at the age of ninety.

Dr. Tweedy was born in Vernon River, Prince Edward Island, Canada, March 14, 1862. He graduated from Prince of Wales College, Prince Edward Island and received his medical degree from Toronto University in 1890. After taking postgraduate study at G.M.P. and So Ho Hospital for women in London, England, he located at Winona.

Dr. Tweedy was a fellow of the American College of Surgeons. He was a member of the Winona County Medical Society, the Minnesota State Medical Asssociation and the American Medical Association. During World War I he served as a captain in the United States Army Medical Corps.

He was a member of the Masonic Order, the Improved Order of Red Men, the Independent Order of Odd Fellows, the American Legion, the Arlington Club and the Winona Country Club.

Dr. Tweedy is survived by his wife, two sons, Dr. Robert Tweedy and Dr. John Tweedy, both of Winona and six grandchildren.

Olac

Mead's powdered formula designed for both full term and premature infants

OLAC
A High Protein Formula For Infants
MEAD JOHNSON & CO.

gives a strong start for a healthy childhood

Excellent tissue turgor and muscle development in babies fed Olac® are clearly shown by steadily increasing clinical observations. These babies tend to gain weight without becoming fat, are sturdy, and resist infections well. They are generally vigorous, with happy dispositions. They get a *strong start* for a healthy childhood.

Designed for optimum nutrition of both full term and premature infants, Olac supplies milk protein in exceptionally generous amounts, to promote *sturdy growth*. Its fat is an easily digested, highly refined vegetable oil. Dextri-Maltose® supplements the lactose of the milk, to meet energy needs and spare protein for its essential tissue-building functions.

Convenient and simple to use, Olac feedings are prepared merely by adding water. A convenient special measure is enclosed in each can. One packed level measure of Olac to 2 ounces of water gives a formula supplying 20 calories per fluid ounce. Olac is valuable not only for bottle-fed infants but for supplementary and complementary feedings of breast-fed infants.

DO YOU KNOW

It is only on a Group Basis that you can have Accident and Health Insurance with all these features

1. Individually non-cancellable
2. Renewable to age 70
3. Free of all objectionable exclusions
4. Low cost
5. No increase in premium for advance in age
6. Pre-existing conditions covered
7. No requirement of House Confinement
8. World Wide Coverage

Therefore, it would be well to give consideration to the Group policy made available to you through your Society.

* This identical triplet allergic to milk

MULL-SOY eliminated symptoms, gave superior weight and growth curves

From the Summary* "A case of gastrointestinal allergy caused by milk in one of a set of identical female triplets is reported. Elimination of milk from the diet of the allergic baby and substitution of soy milk caused a dramatic regression of symptoms, and weight gains which surpassed those of the non-allergic sisters."

From the Conclusions* "Milk allergy need no longer be the difficult infant feeding problem it was formerly. Complete elimination of milk and all milk-containing foods is feasible and desirable in milk allergy and can now be safely and simply carried out. The soy preparation [Mull-Soy] fed to Baby R gave weight and growth curves equal to and better than those of the two sisters fed a cow's milk formula."

*Sobel, S. H.: Milk Allergy in a case of Triplets, *Clin. Med.*, August 1952.

The $64,000,000,000 Question Is

Why do Professional people think their accounts are different from commercial accounts? Our answer is "No Difference."

Your patients have the same jobs
Your patients have the same income
Your patients have the same debts
Your patients have the same habits
Your patients have the same excuses

Commercial enterprises collect systematically, leaving the Professional class holding the bag.

The wheel that squeaks gets the grease.

Psychological warfare commences immediately upon your forwarding your accounts for credit control and collection service.

The services offered by the Professional Credit Protective Bureau "Division of I. C. System" have been adopted by over 50 trade associations extending from coast to coast.

After twelve years in the liquidation of professional accounts receivable, you will be able to benefit by our experience.

Not A Collection Agency — All Monies Paid Directly To You

COST less than collection through your own efforts and in most cases one-half of usual collection agency fees.

Operates with extreme courtesy and goes to the fullest extent the law permits.

Our contention is that this is the outstanding credit control and professional collection service in the United States.

- NO ASSIGNMENT OF ACCOUNTS
- RETAINS PATIENTS' GOOD WILL

When you want money bad—we offer a service that is good!

Meat...

and High Protein Therapy in Liver Cirrhosis

A recent critical study of the results of dietary treatment in 68 patients with liver cirrhosis indicates that in its early stages the disease may respond to a nutritious high protein diet.* In most instances, advanced cirrhosis can be stabilized, if dietary and living habits are properly adjusted, permitting patients to return to useful endeavors.

Biopsy was employed in establishing diagnosis of liver cirrhosis and in determining the extent of liver change. Individual patients were followed for from one to three or more years. The basic therapeutic regimen consisted of 200 Gm. protein, 500 Gm. carbohydrate, sufficient fat to render the food appetizing, moderate vitamin supplement (one therapeutic capsule daily), and one-half ounce of brewer's yeast three times daily. Variables included use of a low calorie diet (1,500 calories or less) with 150 Gm. protein, 1 Gm. methionine four times daily, and intravenous injections of liver extract.

Meat can play a significant role in the dietary treatment of the patient with liver cirrhosis. It is an outstanding source of protein of excellent biologic quality, the B group of vitamins, iron, and other essential minerals—nutrients especially important in the therapeutic regimen. Other advantages of meat are its palatability, its stimulating effect upon the flow of digestive juices, and its easy digestibility.

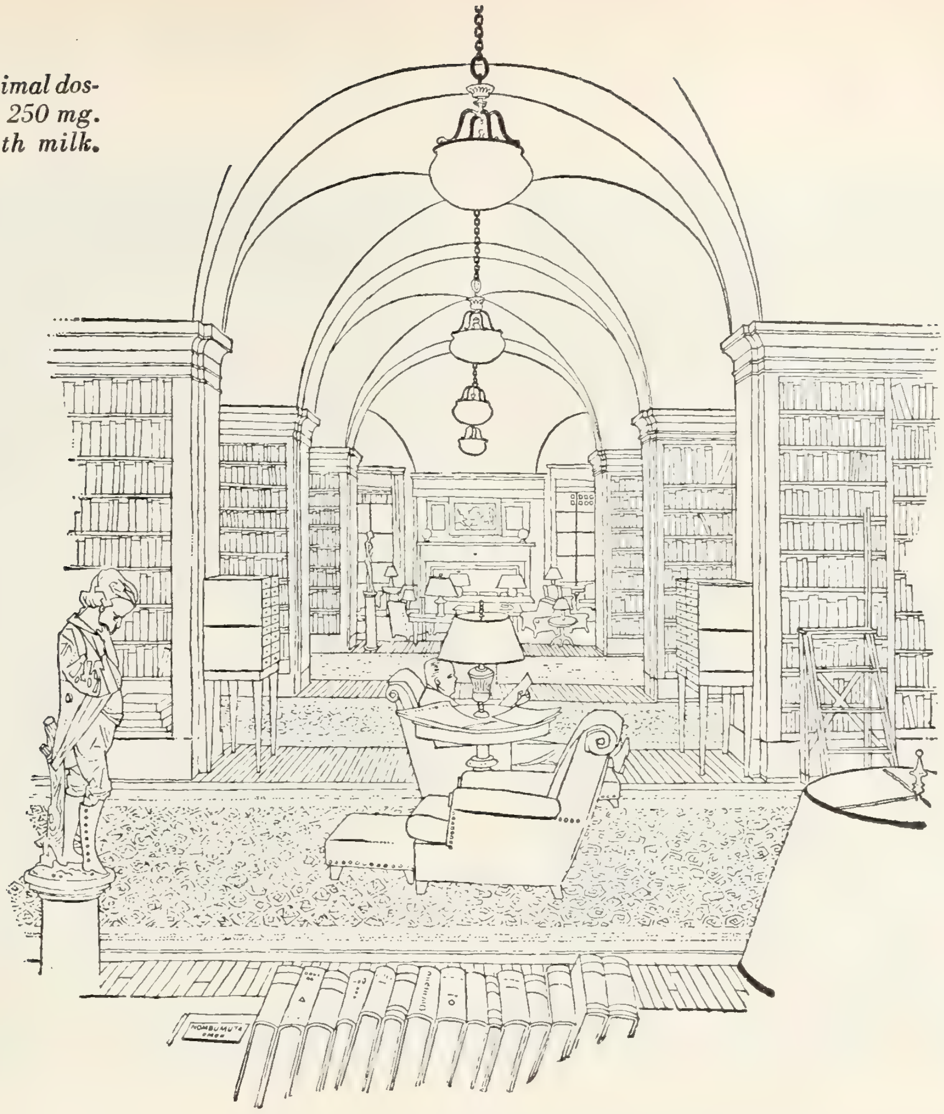
New aureomycin minimal dosage for adults—four 250 mg. capsules daily, with milk.



Library, Union League Club, Philadelphia, Pa.

From among all antibiotics, Dermatologists often choose

AUREOMYCIN

Hydrochloride Crystalline

because

Aureomycin provides mild bacteriostasis in diseases of the skin.

Aureomycin has been found effective in pinta, yaws and many bacterial infections of the skin (furunculosis, impetigo, pyogenic dermatitides, sycosis vulgaris and tropical ulcer). It is at present considered preferable to administer the drug systemically in these conditions. Aureomycin is also useful in the control of contributing or secondary infections associated with many dermatoses.

Throughout the world, as in the United States, aureomycin is recognized as a broad-spectrum antibiotic of established effectiveness.

Capsules: 50 mg.—Bottles of 25 and 100; 250 mg.—Bottles of 16 and 100.
Ophthalmic: Vials of 25 mg. with dropper; solution prepared by adding 5 cc. distilled water.

From Birth
Through the
"Toddling"
Age...

Baker's Modified Milk

MORE and more doctors everywhere are prescribing Baker's Modified Milk because Baker's is prepared especially for feeding newborn and young infants from birth to the end of the bottle-feeding period.

For Toddlers, too, Baker's Is Ideal

When the bottle-feeding period is ended, Baker's Modified Milk in normal dilution** may be fed from a cup or poured on cereal like any fluid milk. Because it provides a nutritionally adequate* formula, containing proteins, carbohydrates, essential fatty acids, minerals and vitamins, Baker's can be used to advantage during baby's entire first year of life.

Many thousands of infants thrive on Baker's —and many thousands of "toddlers" raised from infancy on Baker's continue to deserve Baker's as part of their daily diet. You can continue to prescribe Baker's until the infant reaches the "run-around" age.

BAKER'S
MODIFIED MILK
BAKER'S
MODIFIED MILK

POWDER and LIQUID

Made from Grade A Milk (U. S. Public Health Service Milk Code) which has been modified by replacement of the milk fat with vegetable and animal fats and by the addition of carbohydrates, vitamins and iron.

*When fed in normal quantities, provides amounts of proteins, vitamins (except C), minerals and essential unsaturated fatty acids equal to or exceeding the daily recommended allowances of The Food and Nutrition Board of the National Research Council.

**Dilute with equal parts of water.

IN CONGESTIVE HEART FAILURE

"In severe congestive failure, our most dependable remedy is the mercurial diuretic . . . Its combination with theophylline has been a distinct advance."[1]

Salyrgan-Theophylline is a highly effective combination of a mercurial diuretic and theophylline. It may be given orally in certain cases.

Salyrgan-Theophylline is extensively employed for the treatment of cardiac and cardiorenal edema, dropsy of nephrosis and ascites of hepatic cirrhosis. The diuretic response does not "wear out," so that in most cases administration may be repeated as required for years, without loss of efficiency.

Noth,[2] for instance, in discussing a case of Pick's disease, states that the patient "has received about 450 doses of mercurial diuretics, nearly all of which were of Salyrgan given [parenterally] . . . At no time has he experienced orthopnea, nocturnal dyspnea, or episodes of dyspnea while at rest. He is still working every day as a banker . . ."

"Actually, it has not been so much a case of PENTOTHAL Sodium's supplanting other anesthetic agents and methods as it has been of complementing and supplementing them to the mutual advantage of one another."

Adams, R. Charles (1951), Intravenous Administration of Pentothal Sodium in Combination with Other Anesthetic Agents and Methods, J. Missouri Med. Assn., August.

In minor and major surgery, for induction or induction and maintenance, *alone or in combination* with other anesthetics, PENTOTHAL Sodium continues to grow in popularity in operating rooms throughout the civilized world. Not without reason:

Eighteen years of experience, nearly 1900 published reports have shown that intravenous anesthesia with PENTOTHAL means a smooth, easy induction, generally without anxiety. And that deeper anesthesia may be had in a moment, as needed. Recovery is short, pleasant and usually without nausea. No bulky frightening equipment is needed. The fire and explosion hazard is eliminated. And, as it says above, this ultra-short-acting barbiturate complements and supplements other agents to "the mutual advantage of one another."

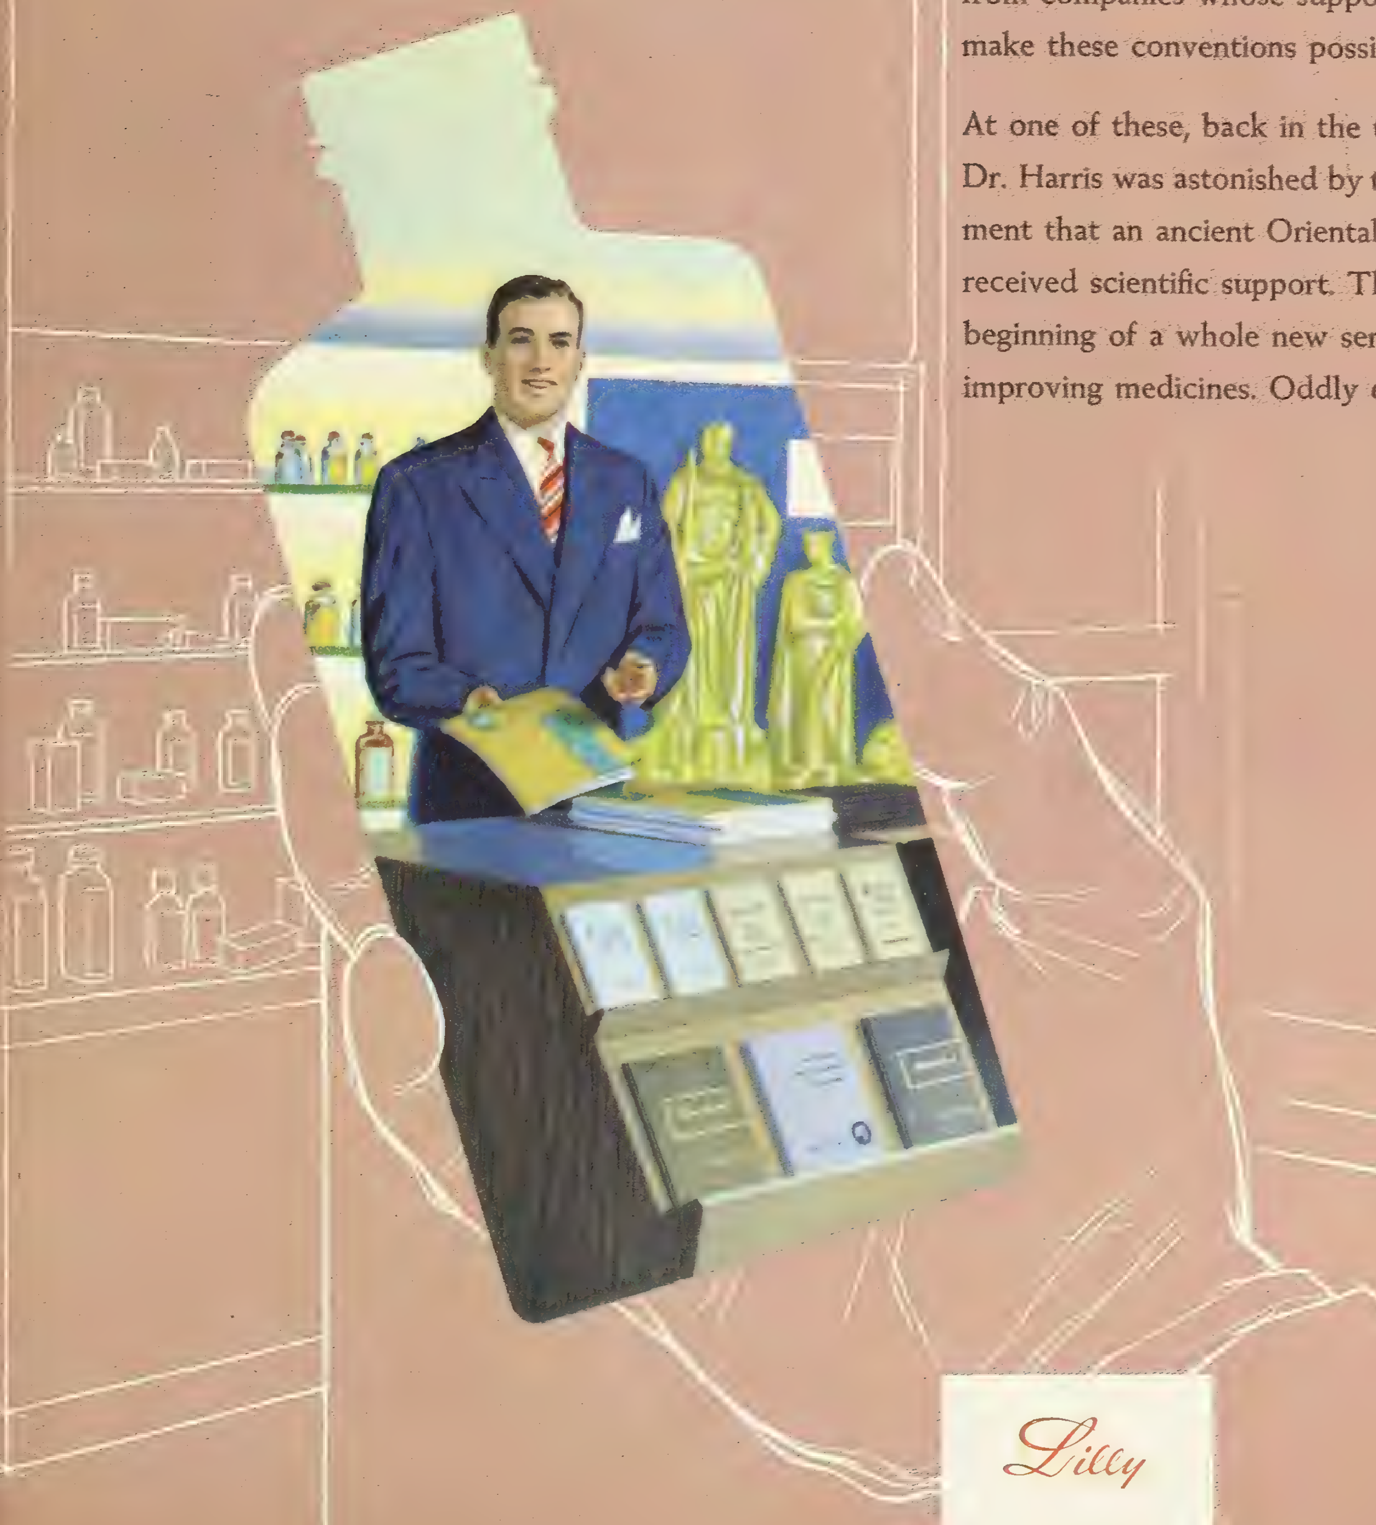
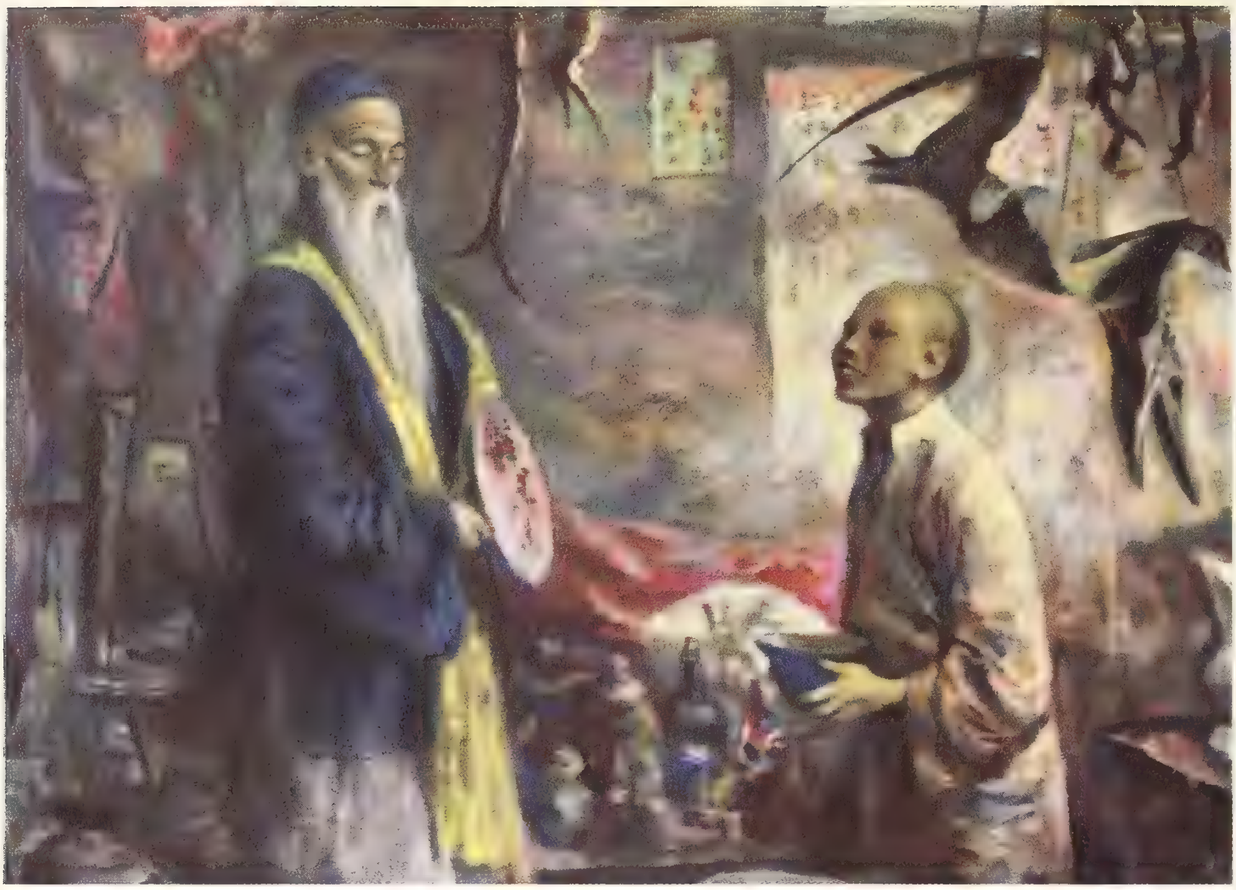
Doctor Harris attends a convention

More medical progress has occurred in his lifetime than in a dozen previous generations. Two-thirds of the medicines he uses today were unknown only ten years ago. As a result of this progress, he has acquired the problem of keeping abreast. He solves it in some measure by attending medical conventions, where he listens to lectures on most recent developments. There, too, he visits technical exhibits and learns of the most recent products from companies whose support helps make these conventions possible.

At one of these, back in the twenties, Dr. Harris was astonished by the announcement that an ancient Oriental herb had received scientific support. This was the beginning of a whole new series of ever-improving medicines. Oddly enough . . .



Lilly



. . . it all began with Ma Huang

In the Chinese village of his birth, young Chen had seen things which assured him that many of the herbs which his people had used for thousands of years were potent remedies. This he believed despite his respect for the Western doctor who would use only drugs from abroad—drugs which were scientifically established. Eventually his ambition to prove his belief brought him to America, where he studied pharmacy and, later, advanced chemistry, physiology, pharmacology, and, finally, medicine. Thus equipped, he returned to China, where he began his experiments with the herb Ma Huang. After isolating the active principle as crystalline ephedrine, he and Dr. Carl F. Schmidt conducted experiments and proved that ephedrine truly had the properties for which the crude drug had been used empirically. Following the well-received presentation of these facts to the 1926 convention of the American Medical Association, Dr. Chen accepted the direction of Lilly's pharmacologic research. There, continuation of his studies was instrumental in developing a series of even better synthetic decongestants. Thus, paradoxically, a small boy's faith in his people's traditions led to progress in modern medicine.

THE TREATMENT OF THE CONVALESCENT CARDIAC PATIENT

CHESTER M. KURTZ, M.D.

Professor of Clinical Medicine
University of Wisconsin Medical School
Madison, Wisconsin

THE TWO most common cardiac conditions requiring prolonged and intensive treatment are congestive failure and acute coronary occlusion. I shall confine my remarks to the management of the convalescent periods following these two episodes.

Decompensation

It is not within the scope of this discussion to go into the treatment of the acutely decompensated patient and I shall simply have to assume that the generally accepted measures such as rest, sodium restriction, oxygen, digitalization, and diuresis have been instituted and that the patient has responded satisfactorily. It is not easy to define the exact point at which convalescence begins but for the purposes of this discussion we may consider that when the chief signs of decompensation (dyspnea, pulmonary congestion, liver engorgement, and peripheral edema) have largely disappeared and the patient is obviously on the mend, the convalescent period has been reached.

Physical Activity.—Years ago prolonged bed rest was the vogue, but we have learned through sad experience that absolute bed rest can be overdone and is not without its hazards and complications. Even during the acute stage of decompensation the patient should not be expected to lie flat but should be supported at the angle which affords the greatest degree of comfort. Usually this will be a nearly sitting position.

Passive exercises of the legs should be instituted early even before the congestive failure has completely subsided, and after a few days the patient should be urged to exercise the leg muscles by flexing and extending the knees ten to twenty times on several occasions during the day. The decompensated patient has a peculiar tendency to develop phlebothrombosis but with a little attention to daily leg exercises this need not be feared.

Ordinarily by the end of the first week, if the treatment has been successful, the patient can be placed in a comfortable chair close to the bed, with his feet on a stool. Starting with thirty minutes morning and afternoon the sitting-up periods may be lengthened gradually as tolerated. The patient's own sense of fatigue should be the criterion for returning to bed. As soon as he is able to sit up comfortably for two hours in the morning and two hours in the afternoon he could begin to take a few steps and after another day or two should be on bathroom privileges.. As this point most patients can be discharged to their homes where activity is gradually increased as tolerated. It may be another two or three weeks before stair climbing should be attempted. Short walks out of doors are then in order, and when the patient is finally able to be up and around a good share of the day without undue fatigue the convalescent period can be considered at an end.

Diet.—It is now common practice to place the decompensated patient on a "low sodium" diet with the sodium restricted to less than 1 gram a day, Schemm's neutral or acid ash diet has been found highly satisfactory. This can be car-

---

Presented at the annual meeting of the Minnesota State Medical Association, Minneapolis, Minnesota, May 27, 1952.

ried right through the convalescent period with perhaps some relaxation of the sodium restriction after the first week or two. A simple but effective method of determining whether or not the patient is taking too much salt is to weigh him every morning before breakfast and any tendency for fluid to accumulate in the tissues as the result of poor electrolyte balance will promptly manifest itself in a weight gain. In very severe and stubborn cases where edema has been difficult to control one may resort to the Kempner rice diet for the period of convalescence. It is important to make certain that an acute sodium deficiency does not develop as this may be far more dangerous than a mild degree of congestive failure. Salt substitutes may be tried but, unfortunately, the one which most resembles sodium chloride contains lithium which has been found highly toxic in a few instances. However, small amounts of this material can be permitted especially if the sodium intake has not been too drastically restricted.

Fluids.—Up until ten years ago it was fashionable to restrict drastically the fluid intake of the decompensated patient as the general anasarca indicated only too obviously that he already had an excess of water in his system. From time to time a timorous voice had been raised in protest against severe fluid restriction but it remained for Schemm, speaking in Saint Paul just ten years ago, to wake us up to the fact that an edematous patient could at the same time be markedly dehydrated and a prompt diuresis induced by forcing fluids. This was greeted as rank heresy at the time but those who had the courage to try it quickly found that Schemm was right. It is now common practice to encourage the decompensated patient to drink all the water he desires and attempt to keep the daily fluid intake at three liters or better. Orange juice, grapefruit juice, and lemonade have to be curtailed to a certain extent due to their sodium content, and it is probably not wise to permit more than one-half glass of orange juice per day.

Digitalis.—In most instances a maintenance dose of digitalis is indicated right through the convalescent period. Many cardiologists still support the old adage, "Once digitalis, always digitalis," but this is not necessarily true and in appropriate cases this drug may be discontinued even before convalescence has been completed.

Diuretics.—In considering diuretics we are quite apt to think only of the mercurials and forget that other less irritating and yet highly efficient diuretic drugs are available. It should be remembered that ammonium chloride is an effective diuretic and probably could be used a great deal more extensively than it is. One gram of enteric coated ammonium chloride taken four times daily frequently will keep the previously decompensated patient at "dry weight." In many instances it will be necessary to give the ammonium chloride only one week out of each month whereas others may have to take it steadily over a prolonged period of time. Many of us have all but lost sight of the xanthine diuretics which can be depended upon to promote an active diuresis in most instances without deleterious effect on the kidney. Ten grains of theocin three times a day for three days will usually get rid of any ordinary accumulation of fluid during the convalescent period. In the more stubborn cases mercurials may have to be resorted to and can be given either orally, parenterally, or in combination. Although the ion-exchange resins are not true diuretics they can frequently be depended upon to prevent the formation of edema in the milder cases.

Anticoagulants.—Dicumarol and other anticoagulants are not ordinarily indicated during the convalescent period unless embolic phenomena occur.

Vitamins.—It is usually well to give some one of the poly-vitamin preparations to these patients on restricted diets and perhaps the most important of the vitamins is the B complex.

Morale.—Fully as important as the proper medical treatment is the maintenance of the patient's morale. The physician, the nurse, and the family should make every effort to suround the patient with an air of cheerfulness at all times. Words of encouragement go a great deal farther than too much sympathy and commiseration. Much can be accomplished by stimulating the patient's interest in various fields such as music, art, science, history, literature, hand work, and even stamp collecting. Some patients with a flare for literary composition have become very creditable poets while recovering from an attack of heart failure. "Sad sacks" and gloomy friends who regale the patient with stories of similar cases which terminated fatally should be kept a long distance away.

Occupation.—As the end of the convalescent period approaches some thought has to be given to the future and to the type of occupation to be recommended for the patient when he is ready to resume his place in society. Obviously, it would not be wise to send the patient back into the type of work which precipitated the attack of congestive failure, but in many instances certain modifications can be instituted which will avoid the necessity of a complete change of occupation. In other instances it may be necessary to train the patient for an entirely different type of work. In the case of the housewife rearrangement of the kitchen and the institution of certain labor-saving methods may enable her to resume a considerable portion of her housework without endangering her health. In every case the objective should be to keep the cardiac patient contented and busy within the limits of his myocardial capacity and avoid so far as possible that most undesirable state of complete cardiac invalidism which, with a little thought and attention to certain details, can in the great majority of instances be postponed for many years.

Coronary Occlusion

Here again one has to be somewhat arbitrary in defining the onset of the convalescent period. One might consider that it did not start until the patient was out of bed. On the other hand, the myocardial infarct reaches its point of maximum softening about fifth day after the arterial closure and from then on the repair process goes on rapidly and one might consider that after the first week the acute phase is over and the patient is entering the convalescent period. In any event, I feel that the management from this point on is sufficiently important to warant our careful consideration and for the purposes of this discussion would like to consider the convalescent period as beginning about one week after the acute episode. A rather wide divergence of opinion exists as to the proper conduct of the early convalescent period, ranging from the very conservative method of insisting upon complete bed rest for at least two and sometimes three months, to the opposite extreme of sending the patient back to work the day after the occlusion has occurred.

Levine has recently published his experience and recommendations in a thought-provoking paper which appeared in *The Journal of the American Medical Association* for April 19 of this year. His series consisted of eighty-one patients who had suffered acute myocardial infarction and he had the majority of them out of bed and sitting in a chair within the first two days. They were lifted or helped into a wheelchair and pains were taken to avoid any pressure in the popliteal spaces. He permitted the patient to sit up in a chair until fatigued and urged him to remain out of bed as much of the day as possible without causing discomfort. This amounted to one or two hours the first day and gradually increased until, at the end of one week, the patient was in the chair the greater portion of the day. Contraindications to the "armchair" treatment were: (1) continuing state of shock, (2) marked debility, and (3) concomitant cerebrovascular accident. Such signs or symptoms as high temperature, severe pain, friction rub, diastolic gallop rhythm, heart block, arrhythmias in general, and need for oxygen were not considered contraindications to sitting in a chair. The patient was encouraged to feed himself and was permitted a bedside commode or toilet privileges. The patients were permitted to walk a few steps at the end of the third week and usually were out of the hospital in four weeks. Anticoagulant therapy was used in all but nine patients. The end results in this series compared favorably with patients treated by the more conventional methods; complications were no more frequent, and the mortality rate no higher.

Every clinician has his own favorite way of treating coronary occlusion and, for my part, I prefer to keep the patient at bed rest for four to six weeks depending upon the severity of the attack. One can be guided by the general condition of the patient, the regressive changes in the electrocardiogram, and the improvement in the sedimentation rate. These two laboratory procedures are best followed at weekly intervals. I would prefer that the patient did not feed himself for the first week but have no objection to the use of a bedside commode as this is frequently preferable to a bed pan. The chief concern during this early stage is the possibility of cardiac rupture. White reported such an occurrence in 3.7 per cent of 270 cases following fresh infarction at Massachusetts General Hospital treated in the conventional manner and in 73 per cent of twenty-two psychotic patients who were difficult to control. Rupture is most apt to occur on the fourth or fifth day and is relatively rare after the tenth to twelfth day. The patient should be encouraged to keep the back rest rolled well up and even at night should sleep with his head fairly high. Leg exercises are prescribed after the first week and the patient is turned on his abdomen with a pillow under the hips for a period of fifteen or twenty minutes twice daily.

If the sedimentation rate has dropped nearly to normal and the electrocardiogram has shown definite improvement at the end of the fourth week the patient is permitted to sit in a chair for fifteen minutes morning and afternoon increasing this by fifteen minutes each day until he is sitting up two hours twice daily. If the clinical evidence points to a more severe infarct with slow healing the patient is kept in bed for the full six weeks. After he is able to sit up for two hours twice daily without fatigue he is permitted to take a few steps, increasing both the walking and sitting up daily. After one month of this he should be up and around full time without fatigue and stair climbing may be attempted. The patient who has suffered a coronary occlusion should ordinarily plan on a convalescent period of at least three months before attempting to return to work. Not infrequently it may be advisable to spend the last few weeks of this period away from home at some vacation spot, removed from the temptation of getting back to work or business prematurely.

Diet.—The whole question of diet in patients with coronary disease is at present the object of much controversy and a great deal of study. Until the exact role of cholesterol metabolism can be accurately determined it would be well to place the patient on a relatively low cholesterol diet avoiding particularly egg yolk, butter, cream, and cheese. It is extremely important to restrict the caloric intake in the obese patient. There is no need to restrict salt unless there is a complicating hypertension or congestive failure. The advisability of using heparin and dicumarol in the early stages of the treatment is outside the scope of this paper but if dicumarol has been started during the acute stage it should be continued until the patient becomes ambulatory. In certain selected cases it may be advisable to continue anticoagulant therapy for months or years after the patient returns to normal activity. In my opinion some one of the vasodilators is indicated routinely and should be continued for an indefinite period. Choline, methionine, and inositol have been recommended for patients who have suffered coronary occlusion, the purpose being to improve lipid metabolism and thus prevent progression of the atherosclerotic process. Some feel that lipotropic substances have the ability to de-cholesterolize the arteries but as yet no definite proof has been adduced to demonstrate that such reversing of the process is actually possible. In some instances where severe and intractable angina has followed coronary occlusion, depression of thyroid activity by means of propylthiouracil or I^{131} have been employed with considerable benefit. In my own opinion this is an irrational approach and I am not sure it is justified. Some of the recent work with relatively small doses of heparin appears promising.

Tobacco.—Tobacco is known to be a very powerful vasoconstrictor and although many authorities permit patients with coronary disease to continue the use of tobacco in moderation, my own feeling is that it is definitely contraindicated. All of us can think of certain exceptional cases where the complete interdiction of tobacco might do more harm than good, but in the great majority of cases the continued use of tobacco can only interfere with the development of collateral circulation and augmentation of the coronary flow.

Alcohol.—Alcohol in relatively small doses (one ordinary cocktail or "shot" of whiskey) twice daily probably acts as a good vasodilator and may be recommended particularly in those persons who have been in the habit of using alcohol in the past. The excessive use of alcohol, however, is known to reduce the efficiency of the myocardium and should be discouraged.

Physical Activity.—The amount of physical exertion to be permitted during the period of convalescence will vary with each individual case and only very general rules can be laid down. Walking is probably the best exercise as both speed and distance can be regulated to suit the individual. The walking should be on level ground and hill climbing should be avoided during this stage. It goes without saying that anything as strenuous as lawn mowing and snow shoveling is distinctly contraindicated. The question of resumption of sexual activity should be faced squarely by the attending physician although the patient himself may be somewhat reluctant to broach the subject. By exercising a moderate degree of restraint and ordinary common sense most men may be permitted to resume marital relations during the latter part of the convalescent period, that is, during the third month.

The Future.—Before the patient returns to work the physician should take time to sit down with him and talk over whatever modifications are going to be necessary in his future living habits. Whether the patient be a man or a woman the question of returning to the former occupation is of paramount importance. In some instances a gradual return to the former job, possibly with certain modifications, may be entirely feasible. However, in many instances, rather profound alterations in the working conditions may have to be achieved and in some cases a complete change in the type of work may have to be effected. Rarely is it advisable to force a patient to give up work altogether. The keynote of this conference should be hope and encouragement and it is good psychology to cite a number of cases in which patients have lived many years and led active and useful lives following an attack of myocardial infarction. The patient should be made to realize that his future depends to a considerable extent on the manner in which he conducts himself and that he has it within his power to assure for himself, to a very considerable extent, many years of good health and good living. Worry and fear should be dispelled as completely as possible. Many doctors experience one or more coronary occlusions and if you look around you, you will find that most of these men are back in active practice and relatively symptom-free. True, a final attack may be waiting for them at the end of the road, but I can think of many lingering types of death and other more unpleasant methods of leaving this earthly life than via coronary thrombosis.

In the words of Dr. Thayer, one of Baltimore's most famous internists, referring primarily to angina pectoris, "The attacks, though distressing, may often be quickly relieved, and in the end, the patient may pass from the turmoil of life to the peace of that which we call death, in the twinkling of an eye, without a pang, without a movement, without a care."

THE SOCIALIST-COMMUNIST IDEA

As a teacher in public schools, I find that the socialist-communist idea of taking "from each according to his ability," and giving "to each according to his need" is now generally accepted without question by most of our pupils. In an effort to explain the fallacy in this theory, I sometimes try this approach with my pupils:

When one of the brighter or harder-working pupils makes a grade of 95 on a test, I suggest that I take away 20 points and give them to a student who has made only 55 points on his test. Thus each would contribute according to his ability and—since both would have a passing mark—each would receive according to his need. After I have juggled the grades of all the other pupils in this fashion, the result is usually a "common ownership" grade of between 75 and 80—the minimum needed for passing, or for survival. Then I speculate with the pupils as to the probable results if I actually used the socialistic theory for grading papers.

First, the highly productive pupils—and they are always a minority in school as well as in life—would soon lose all incentive for producing. Why strive to make a high grade if part of it is taken from you by "authority" and given to someone else?

Second, the less productive pupils—a majority in school or elsewhere—would, for a time, be relieved of the necessity to study or to produce. This socialist-communist system would continue until the high producers had sunk—or had been driven down—to the level of the low producers. At that point, in order for anyone to survive, the "authority" would have no alternative but to begin a system of compulsory labor and punishments against even the low producers. They, of course, would then complain bitterly, but without understanding.

Finally I return the discussion to the ideas of freedom and enterprise—the market economy—where each person has freedom of choice, and is responsible for his own decisions and welfare.

Gratifyingly enough, most of my pupils then understand what I mean when I explain that socialism—even in democracy—will eventually result in a living-death for all except the "authorities" and a few of their favorite lackeys.

A letter from Thomas J. Shelly, teacher of Economics and History, Yonkers High School, Linden and Poplar Streets, Yonkers 2, New York.—January 20, 1951.

REVIEW OF POLIOMYELITIS AT ANCKER HOSPITAL FROM 1931 TO 1951

FRANK G. HEDENSTROM, M.D.
Saint Paul, Minnesota

POLIOMYELITIS is a disease so variable in development and manifestations that for purpose of clarification it may be helpful to outline the clinical features. Table I demonstrates the three phases or stages commonly associated with the acute disease.

TABLE I. CLINICAL CLASSIFICATION OF POLIOMYELITIS

Abortive Type Systemic Phase	Transition Phase	Nonparalytic Type Preparalytic Phase		Paralytic Type
30% present Prodromal symptoms 1-2 days Fever Headache Angina Nausea Vomiting Constipation Diarrhea 80% recover	1-4 days Improvement 20% progress	1-5 days Sudden onset Persistent headache Fever Flushed cheeks Circumoral pallor Anxious expression Pulse rapid out of proportion to fever Rigid neck and back Positive dermographia Hyperesthesia Muscle tenderness Positive kernig Tremor of hands Muscle twitching Reflex changes Spinal fluid—clear to ground glass—cell increase Neutrophiles predominate early—Lymphocytes later Increase of globulin	50-70% Recover 30-50% Progress to Paralysis	Spinal Bulbar Respiratory Circulatory Encephalitic

The abortive type, the systemic phase and the prodromal stage are synonymous. About 30 to 35 per cent of patients present a prodromal history, featured by fever, headache, angina, nausea, vomiting, constipation, or diarrhea. The duration is brief—of one or two days. The occurrence of these symptoms in a large number of persons exposed to poliomyelitis during an epidemic accounts for the statement "that most people have polio unaware of having had an abortive attack." Approximately 80 per cent recover from the prodromal stage, and 20 per cent progress, either through the transition phase, manifested by a temporary feeling of improvement, or directly to the preparalytic phase, which if arrested is known as the nonparalytic type.

The preparalytic phase or stage may last one day or may extend to five or seven days before paralysis ensues. The patient by no means need present all of the symptoms, though commonly may develop a sudden intractable headache that does not respond to analgesics, also neck and back stiffness and a positive Kernig's sign, or so-called "muscle spasm." This picture is sufficient indication for a spinal puncture, which usually reveals a cell count above 10. However, poliomyelitis may occur in the presence of a normal cell count. A predominance of neutrophiles in the spinal fluid usually means the case has been detected early. In the course of a few days, the lymphocytes tend to predominate. About 50 to 70 per cent of the patients recover and are then classified as nonparalytic in type. Thirty to 50 per cent are called preparalytic and progress to the paralytic stage.

The paralytic type may be classified as the spinal type involving the arms, legs, back, and abdomen. The bulbar type which may involve the cranial nerve nuclei of the third, fifth, sixth, seventh, and eighth nerves has a good prognosis. More frequently and more grave is the involvement of the tenth cranial nerve, resulting in paralysis of the palate, pharynx, and vocal cords. Involvement of the respiratory center and the circulatory center is very serious, and they are almost always associated with cranial nerve paralysis. The polioencephalitis occurs commonly with the bulbar type. The cerebellar type with an ataxic gait is not common.

Presidential address before the Ramsey County Medical Society, Saint Paul, Minnesota, January 28, 1952.

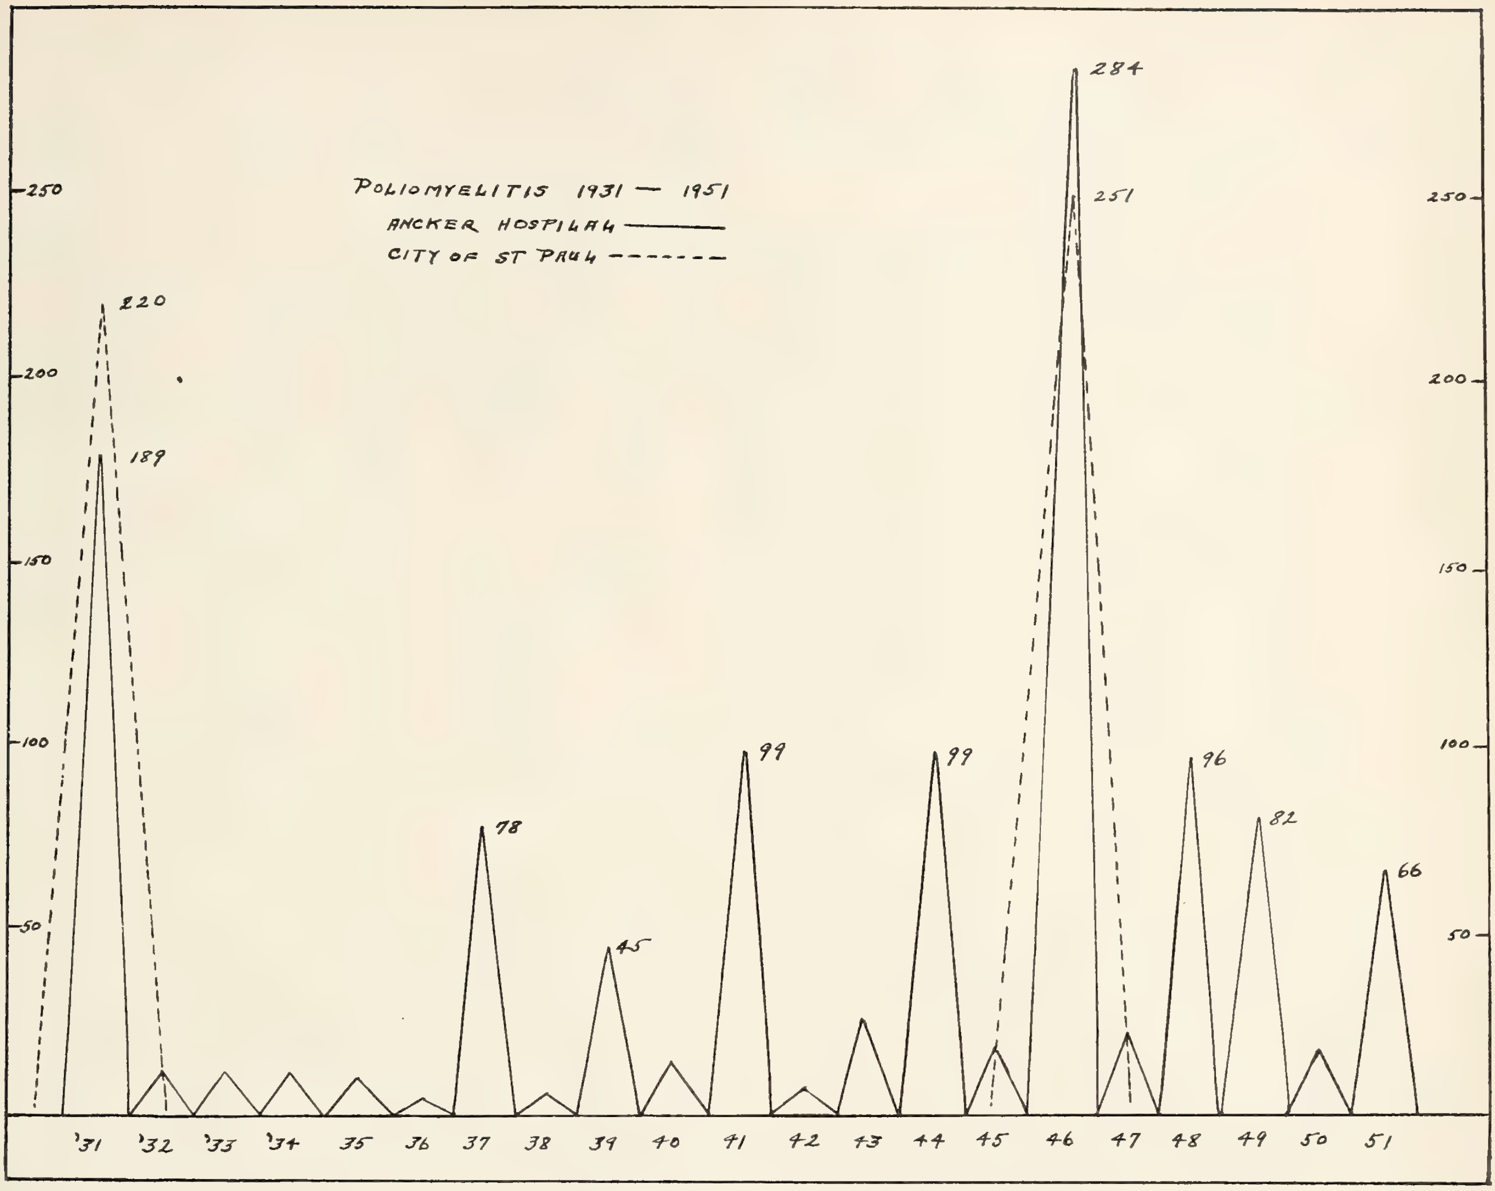

Fig. 1.

The incidence of poliomyelitis in Saint Paul during the decade prior to 1930 was low. Probably many cases diagnosed as meningismus during this period were in reality nonparalytic poliomyelitis.

Figure 1 illustrates the incidence of poliomyelitis at Ancker Hospital from 1931 to 1951, with a high level of 189 cases admitted to the hospital during 1931. During this same year there were 220 cases reported in the City of Saint Paul, which at that time had a population of 270,000; that is .08 per cent or almost one case per 1,000 population. During the next five years the incidence was low. Beginning with 1937, the increase of poliomyelitis occurred almost biennially, attaining a very high level of 284 cases admitted to Ancker Hospital in 1946, followed by a gradual decline to sixty-six cases in 1951.

During 1946 there were actually 316 cases cared for at Ancker; however, thirty-two of these cases were transfers from the University Hospital and were, therefore, not included in the study. There were 251 cases reported from within the city, the population being about 300,000, with an incidence of .08 per cent or practically one case per 1,000 persons. It is interesting that both 1931 and 1946 experienced major epidemics with an equal attack rate of almost one person per 1,000 population. Also in 1931, thirty-one reported city cases (14 per cent) were not hospitalized but cared for in the homes. On the other hand, in 1946 there were thirty-three more cases admitted to the hospital than reported within the city, with no patients cared for in their homes.

Table II shows the yearly case incidence with a total of 1,176 cases. The second column shows the yearly incidence of paralytic cases, with a total number of 435 paralytics (37 per cent of the total group). The third column shows the yearly number of bulbar cases, with a total of 154 bulbars (13 per cent of the total group). There were sixty-five total deaths (5.5 per cent death rate of the entire group).

TABLE II. POLIOMYELITIS, ANCKER HOSPITAL, 1931-1951

Year	Total Cases	Paralytic		Bulbar		Deaths	
1931	189	56	34.0%	25	13.2%	14	7.4%
1932	11	4	36.3%	1	9.0%	1	9.0%
1933	11	6	54.5%	1	9.0%	0	
1934	10	4	40.0%	1	10.0%	1	10.0%
1935	9	2	22.0%	0		0	
1936	1	1	100.0%	0		0	
1937	78	22	28.2%	7	8.9%	2	2.5%
1938	3	1	33.3%	0		0	
1939	45	22	47.7%	3	6.6%	3	6.6%
1940	12	4	33.3%	0		0	
1941	99	35	36.2%	7	7.0%	4	4.0%
1942	5	4	80.0%	0		0	
1943	24	8	33.3%	2	4.1%	0	
1944	99	36	36.3%	12	12.1%	3	3.3%
1945	15	5	33.3%	3	20.0%	0	
1946	284	107	34.1%	58	13.3%	20	7.0%
1947	20	12	55.5%	1	5.0%	0	
1948	96	38	40.1%	4	4.1%	3	3.1%
1949	82	33	40.2%	21	25.6%	9	10.9%
1950	17	6	40.0%	1	5.9%	1	5.9%
1951	66	29	43.9%	7	10.6%	5	7.6%
	1176	435	37.0%	154	13.0%	65	5.5%

The correlation of the bulbar cases in 1931 and 1946 is noteworthy. There occurred twenty-five (13 per cent) bulbars in 1931, with a 48 per cent death rate, and fifty-eight (13 per cent) bulbars in 1946, with a 34.5 per cent death rate. Ancker Hospital operated without a respirator until September 17, 1931, when the first Drinker respirator was acquired. This fact in all probability accounts for the high 1931 bulbar respiratory mortality. A second respirator was acquired in 1933 and a third in 1938. During the 1946 epidemic twelve respirators were in operation, probably a factor in the lower mortality.

The most singular feature of the 1931 epidemic was the high incidence of severe meningeal symptoms characterized by marked neck and back rigidity with opisthotonos. Ordinarily high cell counts are not common, but in 1931 we observed a number of counts up to 1,500 cells.

Following the work of Aycock and Luther, convalescent serum was used in 1931. It was impossible to use control cases because the public demanded the serum produced at the University of Minnesota. Convalescent serum was commonly administered in doses of 40 cc. intramuscularly and continued to be used until 1937 when it was generally conceded to be of little value. The identical incidence of paralytics and death rates in 1931, when convalescent serum was used routinely, and 1946, when no convalescent serum was used, corroborated previous opinion that convalescent serum is of no value.

The physical care from 1931 through 1939 was patterned from Durand Hospital, Chicago, Illinois, where Miss Birgit Tofte, supervisor of contagion, formerly worked under Dr. Weaver and Dr. Parks. All patients were placed on flat polio beds. Chicken wire basket-like splints lined with cotton were used to maintain warmth, protect the feet from the weight of the bed clothes, and to control deformity. Hot wet towels were wrung out and applied to the extremities to relieve painful muscles. When able to be moved, the patients were given hot saline tub baths and hammock baths. The bulbar patients were treated with postural drainage, elevating the foot of the bed, and suction of the pooled throat secretions. Oral feeding was withheld and intravenous fluids were used to prevent dehydration until the secretion was controlled. Early physiotherapy, that is, passive manipulation, was not used. At the end of three or four weeks, the paralytics were transferred to Gillette Hospital for physiotherapy and orthopedic care. By 1940, Ancker Hospital adopted the hot packs and early physiotherapy sponsored by Sister Elizabeth Kenny. This has since become established procedure on the poliomyelitis service.

By 1944 and 1946 there occurred an increasing amount of radio and newspaper publicity; even polio pamphlets were distributed from house to house. This, in all probability, contributed or induced an attitude of fright on the part of the laity not observed in previous epidemics. Patients came

(Continued on Page 852)

IMMUNIZATION DURING THE FIRST YEAR

GEORGE B. LOGAN, M.D.
Rochester, Minnesota

PREVENTION of disease is as important a function of medical practice as is the treatment of disease. Many infectious diseases can be prevented by proper immunization procedures. Since children are susceptible to many of these diseases during the first year of life, it would appear wise to institute effective prophylactic measures at the earliest possible age.

No immunization schedule yet proposed has been universally accepted, and no schedule exists that should not be re-evaluated every few years in the light of new knowledge.

Before I discuss the table of immunization that was approved in 1951 by the Minnesota State Medical Association and distributed by the Minnesota Department of Health, it might be wise to make some comments about methods of administration and some contraindications to the procedures.

Autoclaved needles and syringes preferably should be used. If this is not possible, then such equipment should be boiled for at least ten minutes. The skin of the infant should always be carefully cleansed at the site of the injection. Likewise, the rubber stopper of the vial containing the antigen should be disinfected.

Preparations that contain alum or aluminum hydroxide should be injected intramuscularly. This greatly reduces the incidence of sterile abscesses after immunization. Fluid toxoids and vaccines that are suspended in saline solution can and should be administered subcutaneously.

Infants should not be given immunizing injections when they have any acute infectious disease. Current opinion suggests that it is wise to omit routine administration of a wide variety of antigens whenever acute anterior poliomyelitis is present in the community. The actual necessity for this step has not been proved as yet. The Committee on Immunization and Therapeutic Procedures for Acute Infectious Diseases of the American Academy of Pediatrics in a recent report[2] stated: "The information (published and unpublished) which is available at present is insufficient to conclude whether or not injections of vaccine and/or toxoid and also possibly smallpox vaccination predispose to paralytic poliomyelitis . . . . It is recommended that immunization procedures be not discontinued on a seasonal basis in anticipation of an epidemic. When, however, an outbreak of poliomyelitis of considerable proportion occurs in one's community, then elective immunization procedures in individuals over the age of six months should be deferred." If outbreaks of any of the diseases against which prophylactic preparations are available, such as diphtheria, coexist with an outbreak of poliomyelitis, then immunization procedures cease to be elective and should be given. The committee further stated, " 'Wound boosters' of tetanus toxoid following wounding should never be deferred even in contacts to poliomyelitis cases. . . . This committee has advised that primary immunization against diphtheria, pertussis and tetanus be commenced with combined antigens at three months of age. It is, therefore, generally possible to finish the job and also to include smallpox vaccination before the age of six months. Because of the rarity of infantile paralysis in infants under six months of age, it is recommended that these procedures be followed regardless of the presence of an outbreak of poliomyelitis in the community." Similar recommendations recently have been made at a conference sponsored by the United States Public Health Service and participated in by the National Foundation for Infantile Paralysis.[4]

When immunization is planned for a child who has a history of previous febrile convulsions, it is perhaps best to give fractional doses of antigen, beginning with 0.1 cc.[1] Some physicians routinely administer acetylsalicylic acid in a dose of 1 grain (65 mg.) per year of age every four hours for a day or two after immunizing injections.

It is always wise to question the mother in regard to the occurrence of any febrile, convulsive, local or other reaction to the previous injection when the child is brought in for the second and subsequent injections. If a convulsion or severe

---

Part of a round-table discussion at the meeting of the Minnesota State Medical Association, Minneapolis, Minnesota, May 27, 1952.

From the Section on Pediatrics, Mayo Clinic, Rochester, Minnesota.

reaction has occurred, subsequent injections should be postponed for at least a year. Then I would favor omission of the pertussis antigen. A number of cases have been reported[3] in which an encephalitic type of reaction followed an injection of pertussis antigen in twenty minutes to seventy-two hours. In some of these infants the reaction, manifested by fever, drowsiness and convulsions, was observed after the first injection. Only six of the fifteen infants observed by Byers and Moll[3] made a satisfactory recovery after such reactions.

Only one such reaction has been observed among the children immunized in Rochester. However, children have been seen at the Mayo Clinic who have a neurologic disturbance that apparently resulted from the administration of pertussis vaccine elsewhere. Instances of this type of neurologic reaction have been reported following the use of plain pertussis vaccine or its combination with diphtheria and tetanus toxoids in either fluid or alum-precipitated form. No single brand or type of vaccine apparently is implicated more than others. There is some question whether recently manufactured and "unaged" vaccine may have been responsible for the reactions.[3]

The interval betwen injections of the combined immunization preparation (alum-precipitated diphtheria toxoid and tetanus toxoid with pertussis vaccine) should be not less than a month and probably not more than three months. If, however, for any reason it is necessary to postpone the second or third injections for as long as six months, there probably will be no interference with the development of an adequate final immunity.

Because of the danger of generalized vaccinia, smallpox vaccination should not be done if the child has eczema.

TABLE I. SUGGESTED IMMUNIZATION PROCEDURES

Disease	Suggested Procedure for the Infant and Preschool Child
Smallpox	Vaccinate between 3 and 12 months of age. This may be done when the last dose of diphtheria toxoid is administered.
Pertussis Diphtheria } Combined Tetanus	Use alum-precipitated diphtheria and tetanus toxoids, plus pertussis vaccine. Start at 3 months of age. Give 3 doses at intervals of one month. Give a booster dose at 1½ to 2 years of age.
Pertussis	Use pertussis vaccine. Give 3 doses at intervals of one month, beginning at 3 or 4 months of age. Give a booster dose at 1½ to 2 years of age and again at 3½ years of age.
Diphtheria	Use alum-precipitated toxoid. Give 2 doses at monthly intervals beginning anytime between 3 months and 1 year of age. Preferably start at 3 to 6 months of age. When fluid toxoid is used, give 3 doses at monthly intervals. In private practice do a Schick test six months later.
Tetanus	Use alum-precipitated toxoid. Give 2 doses at intervals of one month, starting between 3 months and 1 year of age. Give a booster dose at 1½ to 2 years of age.

Table I lists the recommended doses and time of administration for immunizations during infancy and the preschool period as given in the currently available table of immunization of the Minnesota State Medical Association.

It is hoped that in the future a satisfactory method will be found to ensure that each child or his parents know what immunization procedures he has had.

"HOW SICK IS SOCIALIZED MEDICINE?"

This is the title of an excellent article by the noted economist, Melchior Palyi, which appeared in the June 16 issue of *The Freeman* magazine.

After surveying Britain's national health scheme, Mr. Palyi found that its results were the depressing opposite of its glowing promises.

He found, for example, that less than three years after the program became law in Britain, 553,577 people were on the waiting list for hospital beds; many of the mentally deficient and the helpless aged are left without institutional care to shift for themselves; the costs of governmentalized medicine have almost trebled in four years to more than 10 per cent of the over-inflated national budget; the something-for-nothing Utopia, advertised world-wide, is now in a slow retreat; the people actually pay for what they get "free"; socialism or no socialism, "first class" treatment is open primarily to those who can afford to pay; fewer than 20,000 general practitioners carry the main burden of medical care for more than 45,000,000 people, and there is no progress at all in industrial medicine.

Mr. Palyi's article is out in reprint form. Copies at $7 a hundred or $60 a thousand may be obtained from *The Freeman,* Dept. PB, 240 Madison Ave., New York 16, N. Y.—*A.M.A. Secretary's Letter,* August 18, 1952.

PRACTICAL NURSES AND HOMEMAKERS FOR RURAL MINNESOTA

KATHARINE DENSFORD, R.N., J. O. CHRISTIANSON, D.Sc., and
EUGENIA TAYLOR, R.N.
University of Minnesota

THE first of April this year a group of young women found their places as licensed practical nurses assisting in the health care of the people of rural Minnesota. These young women are graduates of the second class of the program combining preparation in practical nursing and home management which is offered jointly by the School of Agriculture and School of Nursing of the University of Minnesota.

The University of Minnesota School of Nursing and the School of Agriculture, functioning in a state predominantly rural, have special interest in meeting the health needs of rural communities. For many years, both schools have considered plans for meeting the continued need for nonprofessional nursing care in these areas and in July, 1949, were able to offer jointly the first program in the United States which combined preparation in home management and practical nursing.

The School of Nursing had previously established (1947) a four-quarter program in practical nursing. The School of Agriculture had for some time offered a program in home management, including home nursing.

Following many conferences, a special joint committee of the faculties of both schools worked out a new six-quarter program in home management and practical nursing which, after approval by both faculties, was initiated on a trial basis in the fall quarter, 1949.

Purpose.—The purpose is dual, to prepare young people as practical nurses and as homemakers. Significantly, the program aims at supplementing professional nursing and home care at a point of tremendous need, the rural community. Specifically, it aims at preparing practical nurses who are qualified to function in rural health programs with special emphasis upon home management. Graduates of the program are equipped to assist in the care of the ill in hospitals, in other similar institutions, in health agencies, and in homes. They are also fitted for intelligent active participation in community living.

Advisory Committees.—Two types of advisory committees function in the program. The first of these is a state committee. Its members are representatives of many interested groups in the state as well as of the geographical areas of the state. Current membership includes the following representatives: Dr. J. O. Christianson, superintendent of the School of Agriculture; Miss Katharine Densford, director, School of Nursing; Miss Margery Low, instructor, School of Nursing; Miss Eugenia Taylor, instructor, School of Nursing; Miss Ella Rose, professor, School of Home Economics; Miss Rena Boyle, School of Nursing; Miss Dagmar Johnson, advisory public health nurse, District 8, Little Falls; Miss Beth Proper, West Concord, Grange Youth; Mrs. Lewis Minion, Bingham Lake, Farm Bureau; Miss Aura Keever, supervisor of Home Economics Education, State Department of Education, St. Paul; Miss Dorothy Simmons, State Home Demonstration Leader; Miss Adeline Marschall, Minnesota Licensed Practical Nurses Association; Mrs. Myron Clark, Stewartville, School of Agriculture Alumnae; Miss Madell Motsiff, Superintendent, Wesley Hospital, Wadena; Miss Amy Gunderson, Superintendent, Swift County-Benson Hospital, Benson; Mrs. Clinton Haroldson, Renville, Farmers' Union; Mrs. N. E. Quam, Ebenezer Home for Aged, Minneapolis.

The functions of this state advisory committee are to understand the aims of the program, to aid in guiding and strengthening the program, to interpret the program to the public, and to assist on a statewide basis in developing clinical facilities.

The second type of advisory committee is local. Its membership includes representatives from the local hospital, medical staff, trustees of the hospital, public health agencies, farm groups, local schools and colleges, and other interested groups. Its functions stem from the purposes of the state

committee and are of special significance since it is the local advisory committee which provides community leadership for developing each center for student experience. The community involved in providing the rural experience for the students actually participates in the planning of the program. By so doing it stimulates as well as demonstrates the community's participation in meeeting its own health and social needs.

In the summer of 1951, the advisory committees of Benson, under the chairmanship of Mrs. Don Perrzo, and of Wadena, with Mrs. James Harding, New York Mills, as chairman, did outstanding work in planning and arranging for students to become a part of the communities in which they had their rural experience. This was accomplished by taking the students on tours of nearby towns, of industries and of other points of interest and by inviting them to participate in social events and local organization activities. Frequently, also the students were guests in individual homes.

Faculty.—Already well established on a statewide basis was a plan of rural nursing for professional nursing students directed and co-ordinated by a faculty member of the University of Minnesota School of Nursing. This co-ordinator was therefore utilized for developing the rural aspects of the new home management and practical nursing curriculum. In addition to this co-ordinator, a special well-qualified instructor was appointed to carry major responsibility for instruction, including supervised practice of students in the actual care of patients. Also, each rural hospital in a rural community to which the students are assigned for a quarter of rural nursing experience provides a full-time qualified instructor. The university instructor accompanies the students to the rural communities. She works closely with each local instructor in teaching and supervising the student and in planning for student participation in community activities.

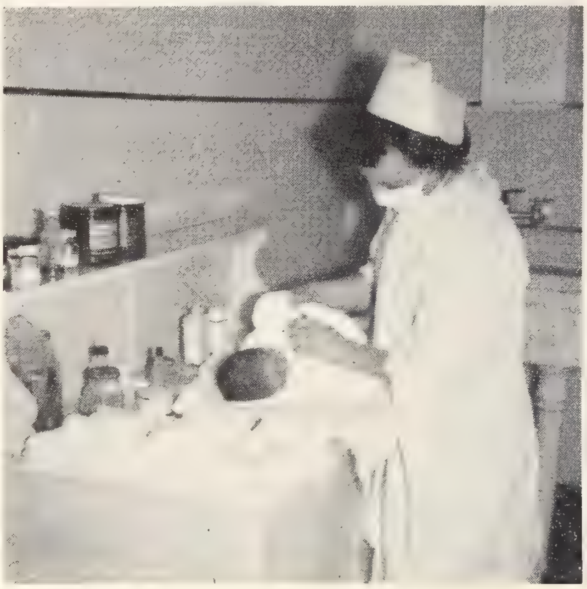

Fig. 2. Caring for a new baby in a rural hospital.

Curriculum.—The curriculum is so planned as to utilize to best advantage the facilities of both schools to accomplish the dual purpose. Thus, during the first quarter, the student attends such classes as elementary bacteriology, psychology, physiology, home management, and science applied to the home. Through campus activities, including the student practical nurse club, she becomes acquainted with the possibilities of her role as a future practical nurse, homemaker and citizen. In the second quarter the student continues courses in the home economics field, nutrition, meal preparation and child care. In the latter subject, the student has actual experience in observing and caring for children in selected homes near campus. Also in the second quarter the student begins classes in practical nursing with carefully selected and supervised experience in the University Hospitals. Here, too, she learns to function effectively as a member of the nursing team. The third quarter is devoted full time to classes and supervised experience in care of

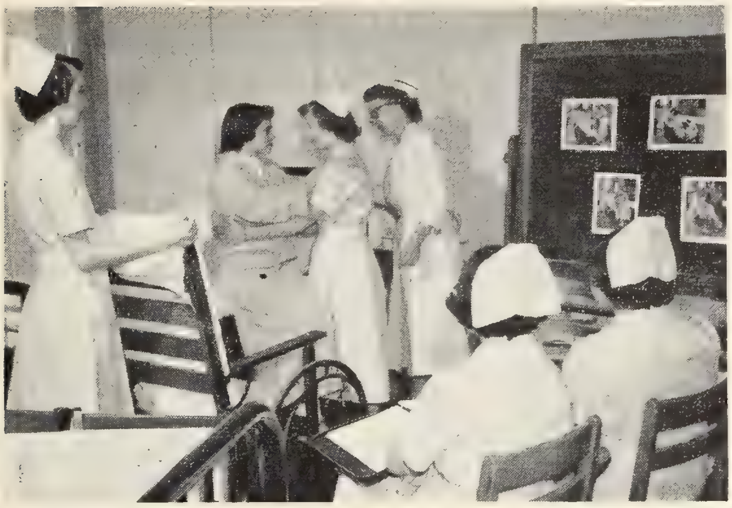

Fig. 3. Nursing instruction in the care of the patient.

general adult patients and children in the University Hospitals. The fourth quarter is spent in a selected typical rural community which has a thirty-five to fifty-bed general hospital and a well-organized public health nursing service. During this time the student continues with practical nursing classes and clinical experiences particularly in the care of the mother and newborn and in the care of the general medical and surgical patient found in a small general hospital. The student accompanies the public health nurse on visits whereby she becomes acquainted with the methods and facilities for meeting health needs in a rural community. By field trips and by actual participation in various community activities she acquires a further understanding of the practical nurse's role in community life and rural health. The student usually has opportunity to go into the home of a new mother and baby for whom she has cared in the hospital and with the supervision of the public health nurse to assist the mother with the home care.

The fifth quarter the student returns to classes on both campuses. At the University Hospitals she completes her clinical experience in care of patients with special conditions, care of the sick child, assisting in the team care of the more acutely ill patient. At a selected nursing home she cares, during a two-week period, for geriatric patients and assists in planning for the recreational and other needs of the elderly person. In the sixth and last quarter of the program, the student carries general education classes, rural sociology, rural sanitation, advanced home economics, Red Cross first aid, and electives such as business courses and music.

Selection.—Students must have desirable personal qualifications, be at least seventeen years of age and preferably high school graduates. Those who are not high school graduates may be admitted on an individual basis and may require more time to complete the course. All students must pass an entrance Health Service examination.

Maintenance.—Throughout this program the student is responsible for her own maintenance as are other university students. She may live in a dormitory while on campus and in an approved home while in the rural area, providing her own maintenance makes possible clinical assignment of the student according to her educational needs. The hours of clinical experience are supervised to insure the student optimum learning and are scheduled within the regular school day and week. This schedule affords the student free time to seek part-time employment to earn part of her expenses, as do other students on campus, or to participate in recreational, social and educational activities. This type of planning also contributes to the student's development of independence, maturity, and ability to function in community living which should aid her adjustment in future positions.

Uniforms.—The student uniform is a gay yellow with matching cap, worn with white apron, stockings and white shoes.

Rural Areas.—The rural areas which have participated in the program in the initial stages are Wadena, Stillwater, Glencoe and Benson. Wesley Hospital and the community of Wadena and Swift County-Benson Hospital and Benson are being utilized in the program at present. Additional areas will be used as the enrollment warrants.

Employment Opportunities.—Upon completion of this accredited program, these young women are eligible to take the state board examination for licensure as practical nurses and may seek employment in homes, hospitals and other health agencies. Of the first group to graduate all except two were employed in hospitals, with a majority in rural hospitals, including Bemidji, Crookston, Mankato, Wadena, Blue Earth, Slayton, and Worthington. One is doing private nursing in homes, and one has married but is con-

GENERAL ASPECTS OF ECZEMA

FREDERIC T. BECKER, M.D.
Duluth, Minnesota

ECZEMA is a hypersensitivity or hyperirritability of the skin either inherited or acquired. It consists of numerous components which express themselves on the skin as erythema, papules, vesicles, weeping, crusting, scaling and thickening with frequent paroxysms of severe pruritus.

Nearly all eczematous eruptions are internal in origin but some extrinsic factors may produce aggravations. In considering the etiology of eczema the following factors are to be considered:

1. The hereditary predisposition is present in nearly 50 per cent of cases either in the form of eczema or another allergic diathesis such as hay fever, vasomotor rhinitis, asthma, urticaria or migraine.

2. An individual born with a dry or ichthyotic skin is more prone to develop irritation especially from soap and water and in cold weather. The eruption is accentuated about the posterior aspect of the arms and anterior surface of the legs where large scaly flakes of skin are evident. Those showing follicular hyperkeratosis about the elbow and knees (nutmeg-grater appearance) seem to be helped by large doses of Vitamin A (100 to 200 thousand units per day). Limited bathing of the trunk and extremities using super-fatted soaps and frequent applications of vegetable oils or hydrophilic petrolatum are beneficial.

3. Orange red, yellowish, greasy scaled eruptions which develop on the so-called seborrheic areas (scalp, face, neck, ears, center of chest, back and perineum) are evidence of seborrheic eczema. These individuals are prone to have oily skin with a shiny nose and numerous comedones about the face, back and chest. In infants the eruptions start in the scalp, face and diaper area. However, it can become generalized. The child is usually overweight and is pale and pasty in appearance. The underlying factors in the development of seborrheic eczema are fatigue, nervous tension and excessive intake of fatty foods, chocolate and vegetable oils. The skin frequently is aggravated by bacterial invasion.

4. Certain eczematoid eruptions have their origin around bacterial infections such as furuncles, impetigo, draining purulent sinus tracts and intertriginous fissures. The skin becomes sensitized to the bacterial products and the eruption is frequently abetted by an irritation from locally applied medicaments. The dermatitis is erythematous with easily removed crusts under which either a serous or pustular discharge is present. The history of beginning about a localized pyogenic focus is indicative of this type. Another dermatosis of a less inflammatory nature may be the result of skin irritability from a fungus infection which is usually either interdigital or in other moist folds of the body. Absorption may also be hematogenous, producing vesicular or pustular "id" eruptions which have a predilection for the palms and soles but may become generalized. The diagnosis is made by the history, the presence of an eczematoid or vesicular eruption with evidence of a primary pyogenic or mycotic focus. Similar eruptions may result from the irritation and infection induced by scratching.

5. The effect of focal infection on cutaneous eruptions has been a controversial issue, the chief supporter having been Andrews[1]. Some recalcitrant pustular eruption of the palms and soles have been improved by removal of abscessed teeth or diseased tonsils and by alleviation of urinary tract infections. There is little doubt that any chronic infection which lowers an individual's reserve vitality is sufficient to keep an irritable skin in a state of unrest.

6. The allergic diathesis of chronic eczema is an important etiologic factor. Unfortunately skin tests are both unreliable and faulty except in inhalant sensitivities. A careful history eliciting periods of seasonal exacerbation, unusual contacts and recent ingestants, and the use of elimination diets are more profitable to the patient than hundreds of needle punctures.

In eczematoid processes believed to be allergic in origin it has been beneficial to place the individual in as ideal surroundings as possible; an

---

air conditioned room in the hospital or a bare uncarpeted room with all radiation sealed off and 40 per cent humidity. No contact with feathers, wool or silk is allowed and a diet eliminating the commonest allergens (chocolate, nuts, pork, eggs, sea foods, tomatoes, citrus fruits, wheat and milk) is provided. If there is no improvement in five days the elimination diets of Flood[4] or Rowe[8] are used.

7. Especially since the publications of Stokes[9] and Becker[2] the emotional or psychogenic factors as the principle underlying mechanism in eczema have received the attention of numerous investigators. Williams[11] found that in 33 patients with infantile eczema he was able to improve two thirds of them by bland therapy and directing his treatment to relieving the mother's anxiety and tension. Obermayer[7] performed projective tests (Rorschach, word association, etc.) and found evidence of compulsive obsessive characteristics and frequent hysterical trends in a fair number of patients with eczematoid eruptions. They also were prone to have internal hostility especially against themselves and were apt to bottle up their emotions.

Sternberg[10] found evidence of a normal functioning pituitary adrenocortical system in eczematous individuals but a failure of these persons to show the normal stress reaction following exposure to heat and humidity. Lobitz[6] has also found that these hypersensitive persons show an abnormal response to intradermal acetylcholine as indicated by an initial vasodilation followed by vasoconstriction.

It has been my opinion that environmental circumstances leading to frustration, anxiety and tension states have been the most important contributory factors. Prominent in this category have been adverse home situations such as living with in-laws, an alcoholic spouse, or carrying on two or three jobs. Emotional tension is also a large factor. For example, I have seen many aggravations occur during the exciting period of a regional basketball play-off when games are played several nights in sequence.

The increasing incidence of functional disease has been thought by many to be due to the rapid tempo of present day life, the trying circumstances of repeated wars, the world unrest and the constant striving to acquire material possessions. Studies at the University of Chicago[3] showed the incidence of neurodermatitis to be highest in the third decade, and that these patients' metabolic rates tended to be low but thyroid medication was ineffective. Other incidental findings in these persons with functional dermatoses are easy fatigability, increased irritability and cyclic personalities (easy elation to quick periods of depression). Frequently other functional diseases were found associated, such as gastric hypermotility, irritable bowel syndrome, migraine headache, functional low back pain and perennial vasomotor rhinitis. A great deal of unrest was evident even in early childhood; refusing to nap, somnambulism, profuse head sweating, awakening and crying without cause. Periods of greatest exacerbations have been the first 18 months of life, the initial school years, at the change to high school and the third decade with all its early struggles of employment and family responsibility. These individuals do not have the normal sense of fatigue and consequently are unaware of becoming exhausted. They are always hyperactive and hyperkinetic but also are extremely hypersensitive and become unduly upset over trivial things. They tend to be impatient, intolerant, and conscientious yet they have spells of dreaming and brooding. The Chicago group[5] utilizing social service investigators in 100 of these patients found as etiologic factors: family incompatibility 24 per cent; sexual maladjustment 20 per cent; living circumstances (in-laws, neighbors, etc.) 12 per cent; economic insecurity 8 per cent; excessive fatigue (long working hours, two jobs) 8 per cent and no apparent cause in 28 per cent.

Obviously, in the management of these individuals, attention must be drawn to eliciting the cause. This may take several interviews to allow the patient to ventilate his discomforts. A sympathetic and interested objectivity must be adopted towards him. It is important to try to have the patient gain insight into his illness by explanations in such simple terms as a "very sensitive and irritable skin," to be aware of "inside tightening up, feelings of inner excitability" and "getting mad inside." Secondly treatment directed to aiding the nervous exhaustion is important: a reduction in activity; a daily nap or midday relaxation aided by taking a generalized sunlight treatment. At first it may be necessary to utilize mild sedation in order to gain lessened tension and a comfortable sleep. Specific local therapy will be discussed later but wetpack applications which keep the patient rested and occupied are the most helpful in the acute stages.

Environmental factors in relationship to temperature and humidity have a large influence on skin eruptions. Excessive heat and humidity are prone to have an adverse effect on the seborrheic dermatoses and also the dyshidrotic eruption of the palms and soles. Miliaria is a frequent complication and is not relieved until a cooler and more restful surrounding is obtained. Dry skin is likewise aggravated by the heat and dryness of artificially heated houses during the cold months and gains benefit from increased moisture. All eczematoid processes seem to be aided by climates which do not have rapid barometric fluctuations as these are prone to induce pruritic exacerbations in sensitive skins.

REVIEW OF POLIOMYELITIS AT ANCKER HOSPITAL FROM 1931 TO 1951

(Continued from Page 844)

directly to the receiving room for rule-out spinal punctures, whereas in 1931 suspect cases were first seen by personal physicians and referred to Ancker Hospital for rule-out study. There was observed a shift in the age group involved from a predominance of children affected in 1931 to a larger number of severe bulbar cases in young adults in 1946.

During 1946 there were no tracheotomies performed. Subsequently eight bulbar patients had tracheotomies performed, with four deaths (a 50 per cent mortality). This, of course, is too small a series to be of any value.

All through the series there were patients admitted as polio suspects who proved to have diseases of an entirely different nature. They were as follows: hysteria—4, epidemic meningitis—2, cerebral accident—1, mumps meningitis—1, lobar pneumonia with meningismus—2, infectious mononucleosis—1, cerebrospastic disease—2, infectious jaundice—1, acute rheumatic fever—3, gastroenteritis—3, nephritis—1, acute angina—4, dysmenorrhea—1, tertiary lues—1, migraine headache—2; that is, in all, twenty-nine cases (2.4 per cent) were diseases other than poliomyelitis.

Summary

1. Major epidemics occurred in 1931 and 1946 with an equal attack rate of .08 per cent or almost one person per 1000 population.

2. In 1931, 14 per cent of patients reported in the city were not hospitalized but were cared for in the homes, while in 1946 all patients were hospitalized, with 12 per cent of patients admitted from outside the city limits.

3. During 1931, convalescent serum was used on all patients; none was used in 1946, with an equal paralytic and mortality index, confirming previous experiences that convalescent serum is of no value.

4. The high 48 per cent bulbar respiratory death rate in 1931 with one available respirator, in contrast to the lower 34.5 per cent death rate in 1946 when twelve respirators were available, is significant.

5. The end results were the same during the first ten years when loose wire and cotton splints with hot baths were used compared to the last eleven years when hot packs and early physiotherapy were used. However, the Kenny method provided more comfort for the acutely ill person and is the method of choice.

THE EVALUATION OF FOOD ALLERGY IN THE CAUSE OF ECZEMA

E. T. CEDER, M.D.

Minneapolis, Minnesota

THE ROLE of allergy in its application to the field of eczematous dermatoses has become a controversial subject. The term allergy is a phenomenon which has many facets—but its original definition was to explain a reaction between sensitizing agents and specific antibodies in an animal organism. It has taken on a broader view, however, to encompass and express many altered cellular activities. At least the public has the conception that it is of major importance in most diseases of the skin. They frequently ask, "Is it my diet?" or "Is it something I am eating?"

It is a fact that many patients afflicted with chronic and recurrent eczema have an associated history of hay fever, asthma, or both, or have a high incidence of some in their family history. It could be deduced therefore that eczematous manifestations in these individuals is unquestionably due to the same atopic faults. There are, however, probably an equal number of eczematous individuals who lack any history of atopy in themselves or their family history.

An etiological and descriptive classification of the wide group of eczematous dermatoses has been presented by the previous essayist. It could be surmised that a given case of eczematous dermatitis which is not satisfied by the diagnostic criterion of being on a seborrheic or infectious basis would be candidates for an allergic work-up. Some would be satisfied by history and pattern to be due to epidermal irritants and therefore of contact extrinsic nature. This subject will be discussed by another essayist in this panel. The remaining groups that cannot be explained on these basis are likely to be either functional or allergic in cause; and these are difficult to discriminate morphologically. The functional type which may be due to a neuro-vascular dysfunction is usually responsive to dermatologic therapy. I would say, therefore, that the cases that are refractory to good dermatological therapy and continue to persist and repeatedly exacerbate at short intervals warrant an allergic study.

The offending reactive substances usually are of protein nature and may be of contact, airborne or alimentary in source. Skin tests have been the conventional diagnostic tool for their identification. The testing materials may be applied by contact patch tests, intradermal or scratch technique. An immediate whealing reaction is interpreted to be a significant indication for their ability to produce cellular reactions in other organs of the body in that respective individual.

In recent years, discriminating allergists and dermatologists have come to the conclusion that these methods have definite limitations and are apt to be fallacious. This is particularly true as regards the testing with ingestant food allergens. Their chief reasons for challenging its validity are:

1. That the whealing reaction produced by the intradermal injection of a food allergen is an urticarial reaction and does not represent the fundamental process of eczematoid dermatitis which is vesicular in nature.
2. That atopic individuals possess a highly reactive skin and that an abnormally high incidence of positive reactions will occur. The mere injection of diluents representing controls often causes whealing reaction. This makes interpretation of all reactions somewhat equivocal.
3. That attempts to reproduce or provoke the dermatitis by feeding the incriminated allergen during periods of freedom from the dermatitis have invariably failed.
4. That the summer seasonal subsidence of eczema, as is frequently true in atopic dermatitis, cannot be explained on dietary relationships.

Consequently, many therapists have abandoned skin testing as a method of evaluating the rôle of ingestants as an etiologic factor and have come to use elimination diets as a more reliable approach. In other words, "the proof of the pudding is in the eating."

Read in the Symposium on Eczema at the annual meeting of the Minnesota State Medical Association, Minneapolis, Minnesota, May 28, 1952.

From the Division of Dermatology, University of Minnesota (H. E. Michelson, M.D., Director).

The elimination diets can be of many types. The selection of the diet should be reasonably exclusive as the chance for success decreases as the number of foods allowed are increased. It is known that some foods are notorious reactors, e.g., wheat, eggs, pork, fish, cheese, tomatoes, and citrus fruits. Consequently, the basic diet should contain low allergenic foods. The diet should be of a palatability which will allow observance for a suitable period of time by those who are willing to co-operate. Rowe has suggested a system of group elimination, such as avoidance of cereals, fruit, vegetables and meat-free diets for trial periods. This is rather slow and requires a considerable period of time. I believe a more direct approach of ascertaining the dietary influence is by a basic diet containing a few palatable foods. For example:

Beef	broiled, roasted or boiled
Potato	baked, boiled or riced
Rye Krisp	
Tea	iced or hot
Sauces	cooked peach or pear
Rice	steamed or in beef stock obtained from the above boiled beef.
Sugar and salt	

The daily menu must be made up from the above foods. I have found that it is satisfactory enough for reasonable adherence for the period of time necessary for clinical observations. It should be scrupulously observed for at least a period of ten to fourteen days as it requires this period of time for the eczematous process to subside and significant degree of healing to occur. If no improvement of the dermatitis has occurred, then it may be concluded that the ingestants probably are not participating in the etiology. One may recheck on the possible reactivity of the above-mentioned foods by a similar period of a subsequent diet where they and all allied products are deleted.

On the other hand, if considerable improvement of the dermatitis has occurred during the trial period of this diet, then the patient is instructed to add one simple food every two days. If an exacerbation of the eczematous dermatitis occurs, the last added food and all similar foods are indicted and should be avoided for the time being. Notation by listing is made by diary method as reactions occur. As the sequence of addition of common foods are exhausted, the exotic and infrequent ones may be tried. The order of adding foods depends on the patient and the physician. I believe it is a good plan to add wheat, butter and milk early in the diet as they are frequent and important supplements and make the diet easier to carry out. Some weight loss occurs from this diet because of its low carbohydrate content but this is not too objectionable.

This type of diet enables one to evaluate the rôle of ingestants in a short period of time. On some occasions, we have been deceived by an improvement which was not related to dietary restrictions and they were merely co-incidental and spontaneous. Co-incidence frequently enters into scientific studies. We have caught these by extending the diet for another fourteen days. An exacerbation occurred in some instances in spite of strict adherence to the regime. This could easily occur in the functional types of eczema.

Topical therapy, such as application of antipruritic lotions and mild ointments, may be used in conjunction with the diet to afford some relief of itching and to avoid aggravating scratching factors. This does not militate against the evaluation of the diet as all these patients have been selected as previously refractory to topical therapy.

The question of other collaborating "X" factors such as fatigue, trauma, emotional and psychic stress, thermal influence, mixing of foods, has been considered to serve as trigger mechanisms in provoking an allergic reaction. This is conjectural and still unknown and is practically impossible to evaluate. It has been apparent to the practitioner who treats large numbers of eczematous subjects that the great majority of the cases are neuro-vascular dysfunctions and that allergy plays a minor role. Recent reported studies, evaluated by employing elimination diets, quote an average incidence as 7 to 10 per cent. It is my experience, that they are relatively rare.

OCCUPATIONAL ASPECTS OF ECZEMA

HAROLD G. RAVITS, M.D.

Saint Paul, Minnesota

WHEN discussing the occupational aspects of eczema, the greatest emphasis should be placed on the preventive treatment. The responsibility here falls on the shoulders of the industrial concern, the physician, and the patient himself. Once the eczema has developed, the treatment is that directed against any type of eczema, either occupational or non-occupational. The treatment must be most carefully and closely supervised to prevent loss of time from work. It aims to keep the patient on the job during treatment, or if he must lose time, return him to his job as quickly as possible. Occupational eruptions account for 60 per cent of industrial disease, excluding actual accidents.[3] For this reason great emphasis must be placed on proper screening of workers, adequate safeguards and prophylaxis, and accurate diagnosis and treatment.

The first step that should be taken is a careful pre-employment examination. The physician should eliminate prospective employes with dermatoses which might be aggravated by the type of employment; also the examiner should familiarize himself with the anatomic and physiologic variations in the skin which might predispose to occupational skin diseases. Workers with finely textured skin, as well as those with dry or senile skin, should not be employed where they contact strong primary irritants. Applicants who are light-sensitive (blondes and people with red hair and freckles) should not be hired in industries where they would contact petroleum products.

Histories obtained from these people are important indicators. Individuals with atopic backgrounds, history of vasomotor instability (hyperidrosis and dysidrosis), are more likely to develop an eczematous dermatitis of the exposed parts, especially if they are going to do wet work. In some industries, individuals who do not perspire freely are to be prefered, while in other industries a moist skin may be of advantage. Workers having thick oily skin withstand the action of fat solvents such as soaps, turpentine, naphtha, benzol, and carbon tetrachloride better than those with dry skin. Persons with a history of former skin sensitization should be refused employment where the work would entail contact with known sensitizers. Atopic individuals, especially those with hand eczemas, prove to be particularly susceptible to dermatitis when exposed to wet work, cleansers, or irritants.[1]

Anyone with a severe chronic dermatophytosis should not be employed until he is free from eruption. It is thought by some observers that these individuals are more likely to develop a contact dermatitis, an "id" eruption, and subsequent eczematization.

Race and age are important factors to be considered in certain job assignments. Dark-skinned people are less affected by exposure to light, heat and petroleum products. Senile skin reacts poorly to wet work.

The prevention of industrial dermatoses is an important phase of the subject. Indications for preventive measures vary with each industry. The object of any preventive measure is to decrease to a minimum the number and length of harmful exposures. Aside from the precautions exercised by the management of an industrial plant, the worker should be required to maintain excellent body hygiene and to report promptly the first indications of the development of a cutaneous disease. Hazards must be detected and eliminated by enclosures and making use of the most modern equipment. Mechanical devices should replace manual contacts; and where this is impossible, gloves should be worn; and when this cannot be done, protective liquids or creams should be tried. The latter must be selected with care because they can cause eruptions themselves. In some industrial processes, the workers may be required to wear protective clothing such as rubber gloves, impervious sleeves and aprons, masks and goggles. Where the irritant is a dust, greasy creams should not be used since these form an ointment with the

poisonous dust, resulting in a continuation of the exposure. Greaseless creams may be used as a protection against petroleum and lubricating oils. Frequent inspection, cleaning and repair of protective clothing is essential. Proper ventilation and cleanliness of the workrooms is also important. Workers exposed to irritants should be taught to clean their skin thoroughly at the end of the day. Periodic instruction and inspection of the worker is always desirable.

No new substance should be introduced into industrial processes until its possible effect on the workers has been thoroughly studied.

The physician who is asked to rule on the occupational or non-occupational nature of a presenting disability accepts considerable responsibility. He must have a knowledge of industrial entities, the general working conditions of the particular plant, and the manufacturing processes involved. Then the doctor can determine if the patient can be treated while still at work, or if he must be removed temporarily for proper care, or if he will have to change occupations, and how soon he can be returned to work. It is a common observation that different irritants provoke identical cutaneous reactions. For example, the characteristics of an eczematous dermatitis caused by cutting oils do not differ from those of a dermatitis caused by synthetic resins. Industrial dermatoses cannot be differentiated by their appearance from other contact dermatoses caused by irritants in the patients' home or outside sources. Consequently the causal agent cannot be determined by a consideration of the charactistics of the eruption.

The treatment or management of industrial dermatitis or any contact dermatitis is divided into two parts: (1) the detection of the causal factors and the prevention of future contacts, and (2) symptomatic treatment for the relief of subjective symptoms and the cure of the eruption. The clinical characteristics and the mechanism of production of industrial dermatoses do not differ from contact dermatoses of non-industrial origin. Consequently the methods of investigation and the therapeutic indictations are identical with those for contact dermatitis in general.

Occupational or contact eczema may be non-allergic or allergic in type. Non-allergic dermatitis is caused by common irritants or substances which when applied to the skin in certain concentrations for a sufficient length of time produce a dermatitis in all individuals. These agents include strong soaps, acids, alkalis and solvents. The treatment of this type of dermatitis consists of prompt removal of the irritant, either by washing with water or a neutralizing solution. Later bland preparations should be used topically. In industrial allergic dermatitis the irritant or substance which produces the dermatitis is innocuous to the non-allergic employe. The dermatitis develops only after one or more contacts and often repeated contacts with the allergen. As previously mentioned, friction, heat, trauma, and excessive perspiration may be contributing factors. Some observers believe that focal or systemic infections or a dermatophytosis accompanied by a dermatophytid may increase an individual's susceptibility to contact allergy.

The management and solution of a case of occupational contact dermatitis of the allergic type is often very complex and difficult. Treatment of the eruption follows along simple dermatologic principles, but this alone is usually not sufficient. Although the dermatitis may disappear when the patient discontinues work, it recurs when he resumes work. A group of cases occur in which the primary dermatitis is followed by frequent relapses and finally by a chronic recalcitrant eczema, even after giving up employment. It is very often difficult in such cases to prove that the occupation and not the complication was the original disease.

Two valuable procedures are necessary for the investigation of a case of allergic occupational or contact dermatitis. The most important is an accurate detailed history regarding occupational and non-occupational exposures, length of present employment, previous employments, number of fellow employes and the incidence of dermatitis among them. From the history and knowledge of the nature of the patient's employment, clues are better obtained for further investigation by patch testing. The patch test must be performed by one who is familiar with the technique, precautions and interpretation of the test. A positive reaction indicates that the patient has an eczematous hypersensitivity to the substance tested but does not necessarily prove that the substance is the cause of the patient's eruption.[2] A person who is sensitive to the material with which he works and cannot develop an immunity or "become hardened" to it should seek some other occupation. The eczema, if uncomplicated, should disappear when a worker is away from the substance which has caused it. It is rare that cases of chronic incurable eczema can be positively traced to an industrial irritant.

Most cases of industrial dermatitis develop in new employes or in employes exposed to a new irritant and are usually mild in character. Such workers should not be taken off the job. It is much better to give them a protective ointment, protective clothing and let them continue to work. In general, workers who do not develop an immunity should be taken off the job and placed in some other occupation if possible.

Trade "eczema" of the hands can occur in varied occupational groups such as in housewives, barkeepers, bakers, printers, machinists, photographers, et cetera. Recently there has been an increased frequency of occupational dermatoses in pharmaceutical workers, dentists, doctors, and nurses who are becoming sensitized to antibiotics. Poison ivy may also be an occupational as well as a recreational hazard.

The chief therapeutic measures are directed toward preventing further injury to the skin. Itching is usually intense, and the trauma caused by scratching makes the dermatitis worse and is apt to produce or spread a secondary impetiginous infection.

The injudicious use of soap and water, friction of rough, tightly fitting garments, and the use of irritating remedies are secondary irritants which often make the dermatitis worse and prolong healing.

The successful treatment depends on the proper use of a few simple remedies in preference to complex preparations which have been advertised to the profession as possessing special merit because of some special ingredient or ointment base. Anesthetic drugs, mercury, picrates, resorcin, penicillin and the like possess strong allergenic properties and should not be used in uncomplicated dermatoses. Sometimes the patient is already sensitive to these and other commonly used remedies. The first indication is to relieve itching and acute inflammation. The more active the dermatitis, the more bland the remedy should be. Surface evaporation should be increased by the application of wet dressings and evaporating lotions.

In the presence of edema and vesiculation, wet dressings should be used. After the acute inflammatory reaction has subsided, treatment should be changed to evaporating and protective lotions. If the dermatitis is subacute, bland ointments are indicated. Chronic occupational eczema does not respond so quickly and satisfactorily to mild topical remedies. The skin is dry, thickened, scaly, and the pruritus is annoying; therefore, stimulating antipruritic ointments are indicated.

In summary, it may be said that occupational eczemas are in most cases contact dermatoses. They may be either a dermatitis due to primary irritants or a sensitization dermatitis. To a large extent these dermatoses are preventable, providing all the scientific facts now available are utilized in co-ordinated co-operation by the employer, employe, and physician. General principles for therapy are those for any eczema or dermatitis, either occupational or nonoccupational.

LASDON FOUNDATION MEDICAL RESEARCH GRANTS

Grants for medical research totalling $264,424 have been appropriated for 1952 by the Lasdon Foundation, it has been announced by William S. Lasdon, Chairman of the Board. More than a score of institutions here and abroad will share in the grants.

One of the largest individual grants was awarded to the Rheumatic Fever Institute of Northwestern University for studies on the influence of dietary factors and enzyme metabolism on the development and treatment of rheumatic fever. Another large grant was given the University College, School of Medicine of Dublin, Ireland, for chemotherapeutic research in the field of tuberculosis, under the direction of Dr. Vincent C. Barry, an eminent authority in this field.

The Foundation is a philanthropic organization established four years ago by the Lasdon brothers, William S., Milton S., Stanley S. and J. S., to support research exclusively in the fields of medicine and health, an interest stemming from the Lasdon family's long affiliation with the pharmaceutical industry. The four Lasdon brothers have been associated for many years in the Nepera Chemical Company, pharmaceutical manufacturers of Yonkers, New York.

THE TREATMENT OF ECZEMA

ROBERT R. KIERLAND, M.D.
Rochester, Minnesota

THE other papers in this symposium have dealt with the problems of contact and occupational dermatitis and the various other problems of eczema including psychogenic factors and their handling, as well as the allergic approach and its use and limitations in the therapy of eczema. Hence, this paper will present the local management of eczema and systemic forms of therapy that have not been discussed by other participants in this symposium.

Before the more or less specific measures are considered, it is well to recall two basic principles of therapy:

1. When in doubt as to treatment, always start with the mildest therapeutic measures.
2. As long as one method or regimen of treatment is providing relief and producing improvement of the eczematous eruption, that method or regimen should be continued.

Local Management

The local management of eczematous dermatitis depends primarily on the morphologic pattern of lesions presented by the patient. For the acute form of eczema, that is, when exudation, vesiculation, formation of bullae, and crusting are present, wet dressings are the treatment of choice. If the area involved is not secondarily infected, dressings wet in a 1 to 16 dilution of Burow's solution or a 0.5 per cent solution of aluminum subacetate, or even saline solution, are indicated. If the eruption is secondarily infected, wet dressings of 1 to 8,000 or 1 to 16,000 dilution of potassium permanganate, freshly prepared, or of Alibour solution, usually resolves the secondary infection so that other measures may be used subsequently. Wet dressings for dermatologic treatment are not impermeable, and the entire dressing should be changed every two or three hours. As the eruption becomes less acute, that is, as the active inflammatory reaction and exudation subside, shake lotions, such as calamine lotion, may be applied or the milder ointments such as plain Lassar's paste, boric acid ointment or zinc oxide ointment may be used. If a shake lotion itself is too drying, it may be thinly covered by a bland emollient. As the process then becomes more chronic, that is, if there is further resolution of the inflammatory reaction and the skin is lichenified and scaly, more stimulating preparations may be used as necessary, such as 3 per cent ichthyol in a base of zinc oxide ointment, or even tar preparations, to which may be added weak percentages of salicylic acid. The more stimulating preparations mentioned may be used in the initial treatment of chronic lichenified eczema of either atopic or contact origin. In addition to the wet dressings used for the secondarily infected lesions, antibiotics are of value. However, ointments containing penicillin or the sulfonamides are not advised because of the high incidence of sensitizations, rather, preparations containing aureomycin, bacitracin, terramycin, or neomycin should be applied since these are less frequently sensitizing.

In addition to the measures outlined, soothing baths of a colloidal nature frequently are beneficial and antipruritic, as well as contributing to the resolution of the inflammatory reaction. These baths may contain starch and soda, boiled oatmeal, or a prepared form of oatmeal, such as aveeno.

If the pruritus is intense, occasionally ointments or shake lotions containing antihistamines are of some value. However, rather frequently sensitizations arise from their use, so that they should be used cautiously. More recently, quotane, either ointment or lotion, has produced excellent results in the alleviation of pruritus with a low sensitizing index.

Systemic Therapy

Systemic therapy, aside from the essential measures mentioned in the other papers in this symposium, usually is not necessary except in cases in which eczema is resistant to local measures. Antipruritic preparations, such as antihistamines, may be given in an attempt to alleviate the pruritus. Aspirin is frequently an excellent antipruritic and may be given in doses of 10 grains (0.65 gm.) four or five times a day. Foreign

protein therapy is an excellent adjunct to other methods of therapy, both in the control of pruritus and in having a more specific effect on the inflammatory reaction of the skin. Autohemotherapy is a mild form of foreign protein therapy and consists of the withdrawal of 8 to 10 cc. from the antecubital vein of the patient; this is injected immediately into one buttock. This procedure may be repeated daily for a short period or two or three times a week for as long as two or three weeks. Other forms of foreign protein therapy include the intravenous use of triple typhoid vaccine, and the use of pyromen (a soluble pyrogen). Small subfebrile doses of pyromen, such as 1 or 2 gamma, administered subcutaneously twice daily for seven to ten days have been advocated by some. However, my colleagues and I have had but little experience with this technique, and we consider when using pyromen that the febrile reaction better produces the results desired.

While cortisone or corticotropin (ACTH) or both have been shown to be of definite value in the relief of inflammatory and pruritic symptoms of acute eczema of either contact or atopic origin, use of these hormones is contraindicated in the treatment of the usual eczematous individual. There is an almost immediate remission in the pruritus of atopic dermatitis followed shortly by improvement of the inflammatory phenomenon. However, these patients have a distinct tendency to become dependent on the hormone in order to obtain relief of their most distressing symptoms. Hence, it is sugested that use of these hormones for atopic dermatitis be restricted to those patients whose condition is resistant to the other types of therapy. If it is necessary to use these hormones, it is suggested that they be given in short courses of therapy. They do not cure atopic dermatitis; there is almost always a relapse of the dermatitis within a short period after administration of corticotropin or cortisone is discontinued and not infrequently the relapse is worse than the pretreatment state of dermatitis.

In contact dermatitis cortisone and corticotropin (ACTH) again produce marked improvement, but it is suggested that these measures not be used in lieu of attempting to detect the contact irritant. If used, the use should be confined to the patient who has acute, rapidly progressive dermatitis with sensitization which cannot be controlled with the usual therapeutic measures. If given, cortisone should be given in full dosage for two or three days and then the dose should be diminished rapidly so that the total course of therapy probably does not last more than seven or ten days.

Desensitization.—For contact dermatitis, attempts at desensitization for the most part have proved to be unsatisfactory. The natural process of "hardening" occurs frequently in industry and with greater frequency than is usually considered likely. However, for most nonindustrial types of contact dermatitis therapeutic attempts at desensitization have not proved too satisfactory. Desensitization affords improvement in the dermatitis or complete relief to no more than 15 or 20 per cent of the patients with ragweed dermatitis taking such treatment. The same controversial aspect appears in the literature concerning patients with repeated bouts of dermatitis venenata due to poison ivy. Recently there is evidence that an aqueous alum-precipitated pyridine extract may be of more value in the prevention and treatment of poison ivy dermatitis than older preparations.

Treatment of Secondary Eczema

Secondary eczematization may complicate and be part of a basic seborrheic dermatitis. In this event the initial treatment again is to allay the eczematous element and then to treat the basic seborrheic reaction. Selsun (a shampoo containing selenium disulfide) is a satisfactory preparation when the eruption involves both the scalp and other hairy portions of the body. It has been used in exudative areas as well without the observance of toxic manifestations. Iodochlorhydroxyquin (vioform), 3 per cent, in cream or ointment is also of value in the treatment of the basic seborrheic dermatitis, as are more familiar preparations containing sulfur.

There is a group of eczematous eruptions confined to the hands that may be nonatopic, nonoccupational and noncontact, and this group presents one of the therapeutic problems. Atopic and contact features must be recognized and ruled out in all instances of eczema of the hands, but there are other causes for which search must be made. Among these are the fungus infections of the hands themselves, which are uncommon, or the so-called vesicular "id" reaction of the hands and fingers, which is seen in conjunction with an acute, inflammatory reaction of the feet. If the eruption is an "id" reaction, the cure of the inflammatory reaction of the feet, or its remission, results in a spontaneous remission of the eruption on the hands. The uncommon mycotic eruption may be identified by direct examination of the vesicles or scales in solution of potassium hydroxide or by culture. The mycelial elements and spores may be recognized under a microscope. The treatment for the acute reaction consists first of whatever will alleviate the acute inflammatory reaction and then, as this subsides, fungicidal preparations may be used.

Other eczematous reactions of the hands may be part of other dermatologic entities, and also secondary to visceral disease, including foci of infection. If the latter are present, the reaction of the palms and soles is more apt to be basically pustular in type but cultures of the pustules are sterile. The underlying focus of infection must be found and treatment directed accordingly. Eczema of this type closely stimulates pustular psoriasis, and unless there is psoriasis elsewhere on the body, it may be indistinguishable clinically from psoriasis. Occasionally, eczematous eruptions of the hands may be due to foods, but in our experience skin tests are of but little value in elucidating the offending agent. Dietary restrictions, according to the methods of Rowe or Flood, may be attempted. However, these reactions seem to be rare, for we have seen but little help from such elimination diets.

One of the most frequent types of dermatitis or eczematoid eruptions of the hands arises as part of dysidrosis or pompholyx, in which the primary lesion is a deep-seated vesicle appearing on the palms and soles or on the sides of the fingers. This is an eruption due frequently to psychogenic factors, and the management is such as has been described elsewhere in this symposium. Another frequently seen eczematous eruption of the hands is that due to household duties, excessive use of soaps, solvents and the like. The eruption, then, is basically contact in type and should be dealt with as contact dermatitis is. The use of rubber gloves with cotton liners should be stressed when household tasks are being performed, and the skin should be lubricated frequently with emollients in an attempt to counteract the excessive drying which the skin has undergone.

Summary

An attempt has been made to discuss briefly the principles of local treatment and management of patients with an eczematous type of dermatitis. Other papers in this series have dealt with the basic concepts of allergy, the elucidation of contact factors, and the psychogenic implications dealt with in certain patients. The basic principles must be dealt with in all patients; otherwise local and systemic therapy will produce less benefit and relief of an eczematous dermatitis.

TAXES

We continue to print from time to time comment relating to taxes in the hope that the membership will note how far this nation has progressed toward what seems perilously near to a confiscatory level.

How high can the Federal tax be jacked before it topples on the economy, impairing earning power, and crushing incentive?

Many economists thought the limit had been reached in wartime 1945, when the U. S. Treasury collected a record total of $43,353,000,000—29.5 per cent of the national income.

Last year Washington collected a total of $56,093,339,429—20.7 per cent of the national income—and moved on with still higher rates, e.g., an increase of 11 per cent in income taxes, to collect still more this year. Of 1951's take, $30,046,211,980 was collected from personal-income, retirement, old-age, and unemployment taxes. The rest came out of corporation profits and miscellaneous excise taxes, which will also be higher for 1952.

While the Federal collector was busy, state and local taxes were also pouring in. The nation's total estimated 1951 tax bill: $73,593,339,429, an average of $468 for every man, woman, and child in the United States.*

"The schoolboy whips his taxed top; the beardless youth manages his taxed horse with a taxed bridle on a taxed road; and the dying Englishman, pouring his medicine, which has paid seven per cent, into a spoon that has paid fifteen per cent, flings himself back upon his chintz bed which has paid twenty-two per cent, and expires in the arms of an apothecary who has paid a license of a hundred pounds for the privilege of putting him to death." Thus Sydney Smith wrote in a review of Seybert's *Annals of the United States* in 1820. What would he have written in 1952? Your guess is as good as ours. Do not forget as you go to register and vote that "The power to tax is the power to destroy."—*New York State Medical Journal,* July 15, 1952.

ANTIBIOTIC THERAPY OF BACTERIAL ENDOCARDITIS

II. Current Trends in the Treatment of Subacute Bacterial Endocarditis

JOSEPH E. GERACI, M.D.
Rochester, Minnesota

THE ideal antibiotic for the treatment of bacterial endocarditis should have the following features: (1) it is bactericidal for both Gram-negative and Gram-positive organisms and is able to penetrate to the depths of vegetations, (2) it can be administered orally, (3) it is adequately absorbed without producing gastrointestinal irritation, (4) it has little or no toxicity, (5) it usually produces cure of the disease within ten to fourteen days.

Such an antibiotic is not yet at hand, but it is not too optimistic to state that, in view of the pace of current antibiotic research, availability of an antibiotic agent possessing most of the features just mentioned is a distinct future possibility.

Use of Penicillin in Endocarditis

During the past decade, penicillin has been the antibiotic of choice in most instances for the treatment of bacterial endocarditis. The value of this agent in the treatment of this disease has been reported by many observers.[2,6,12] When penicillin was first introduced, only small doses could be used and the rate of relapses and failures was large. When larger doses became possible, the results of treatment improved. The experiences in the treatment of bacterial endocarditis both in this country and in Great Britain were parallel and are exemplified by the recent report of Cates and Christie that summarized 442 cases in fourteen treatment centers in England in which treatment with penicillin alone was used under the supervision of the Penicillin Trials Committee of the Medical Research Council.[6] The results of this clinical investigation revealed that, in the early trials, the duration of treatment was more important than the daily dose. Later trials proved that the daily dose should be larger. After April, 1946, seventy-one patients who had been untreated were given 500,000 units of penicillin per day for one month. In 20 per cent of these patients, relapse or death occurred and the infection was not under control. More recently, eighteen patients were given 2,000,000 units per day for four to six weeks. None of these patients had relapses or died with active infection.

The Medical Research Council of England recommends that for the treatment of endocarditis, regardless of how sensitive the offending organism may be, the minimal daily dose of penicillin should be 2,000,000 units and the period of treatment should be four to six weeks. The experience in this country has been similar, and the tendency has been to give larger and larger daily doses of penicillin. Currently, the recommended treatment is to give 2,000,000 units of penicillin per day when the infection is caused by organisms that are sensitive to a concentration of penicillin of 0.1 unit per cubic centimeter or less, and to continue this dosage for a period of four to six weeks. When the causative organism is more resistant to penicillin, the daily dose is larger, depending on the relative resistance of the offending organism.

Synergism and Antagonism of Antibiotics

Since streptococci sensitive to penicillin have been found to cause approximately 80 to 90 per cent of cases of subacute bacterial endocarditis, the use of penicillin alone in the recommended dosage has been satisfactory and curative. However, it has been noted that in cases caused by enterococci, which comprise from 3 to 15 per cent of any series, only an occasional cure was produced and then only by the use of large amounts of penicillin. In 1947, Hunter[13] first successfully treated enterococcal endocarditis with the use of a combination of penicillin and streptomycin. Since then, many clinical and *in vitro* studies have been published relative to the combination of these two antibiotics and its use in the treatment of subacute bacterial endocarditis.

Both *in vitro* and *in vivo* studies concerning synergism and antagonism resulting from the use of combined antibiotics have been recorded by Klein and Kimmelman, Nichols, Spicer, Jawetz

---

Read at the annual meeting of the Minnesota State Medical Association, Minneapolis, Minnesota, May 27, 1952.

From the Division of Medicine, Mayo Clinic, Rochester, Minnesota.

and colleagues,[9,16,17,23] Robbins and Tompsett, Hunter,[14,15] Lepper and Dowling, Ahern and associates and Bachman. These studies have disclosed a synergistic effect on the bactericidal action of penicillin when penicillin and streptomycin or penicillin and bacitracin are used together.

The addition of streptomycin to a bacteriologic culture tube containing penicillin causes more rapid and greater bactericidal action, so that all the bacteria in the culture tend to be killed. When penicillin is used alone, a small residue of viable organisms often remains. Complete killing of the organisms is more likely to occur when the two antibiotics are used together than when they are used alone. This is true for most strains of streptococci and other organisms, and is particularly true for the enterococci.

Recent work also demonstrates an antagonism between penicillin and the broad-spectrum antibiotics, such as aureomycin, terramycin and chloramphenicol, both *in vitro* and *in vivo*.[16,23,25] When one of these antibiotics and penicillin are used together, a definite retardation occurs in the rate of bactericidal action of penicillin. Study of subacute infections in mice caused by Streptococcus pyogenes in which combined therapy for five days was used has revealed synergism between penicillin and either streptomycin or bacitracin and antagonism between penicillin and either chloramphenicol or terramycin.[23] *In vitro* studies indicate that this antagonism occurs when the broad-spectrum antibiotics are used in concentrations that are bacteriostatic and does not occur when the concentration is insufficient to produce bacteriostasis or when the concentration is high enough to be bactericidal.

Jawetz and his colleagues recently have shown that antagonism exists also when the broad-spectrum antibiotics are used with streptomycin.[16] However, the antagonism with streptomycin is low when compared to that of penicillin. The evidence indicates that interference occurs only when the organisms are multiplying. A recent report indicated that no antagonism between penicillin and chloramphenicol was demonstrable in mice that were infected with group A streptococci and treated with these two antibiotics for three days.[1] Interference occurred initially but prolonged combined treatment caused a progressive bactericidal action that apparently protected the mice as efficiently as did the use of penicillin alone. Many studies and reports concerning synergism and antagonism of antibiotics indicate that the problem of combined therapy in patients is complex. Many additional careful *in vitro* and *in vivo* investigations, in addition to the actual treatment of many patients, will be necessary before ideas concerning this subject can crystallize clearly.

However, a number of clinical and laboratory studies indicate that definite exceptions exist to the broad generalizations just mentioned concerning antibiotic antagonism.[10,11,17,25] These exceptions occur in situations in which true synergism appears to result from the use of two or more antibiotics against an organism that is resistant to one or more of these agents when they are used separately.[17] Only rarely has it been found that streptomycin interferes with the bactericidal action of penicillin or fails to enhance its effect.[8]

Combined Therapy.—These clinical and *in vitro* investigations have led to the current tendency on the part of some physicians to use combined treatment for bacterial endocarditis. Robbins and Tompsett, Loewe and associates and Hunter[15] have reported on the successful use of a combination of penicillin and streptomycin for treatment of endocarditis caused by Streptococcus faecalis. Penicillin and bacitracin in combination have also been used successfully when penicillin-resistant streptococci were involved[26] and also in a case of endocarditis in which reinfection with a diphtheroid bacillus occurred.[27] Friedberg and Bader stated that the use of bacitracin was curative when it was added to the combination of penicillin and aureomycin after the later two antibiotics had failed to produce any response. On occasion terramycin and streptomycin have been effective when the causative organism was found to be resistant to the commonly used antibiotics when they were given alone.[17] However, this latter combination was not greatly effective in five of six cases in which it was employed at the Mayo Clinic.[18] Hunter has suggested that short-term combined therapy of infections caused by penicillin-sensitive streptococci might be practical and curative in view of the studies on penicillin-streptomycin synergism and he has noted good results in five patients so treated thus far.[14,15]

Clinical Data in Forty-Six Cases

In the light of these recent studies it was felt desirable to review briefly at this time the experience of my colleagues and myself in the treatment

TABLE I. CAUSATIVE ORGANISMS IN 46 CASES OF BACTERIAL ENDOCARDITIS

Organism	Number
Streptococcus mitis	21
Streptococcus (anaerobic)	1
Streptococcus salivarius	1
Streptococcus (type undetermined)	1
Streptococcus faecalis	10
Micrococcus pyogenes*	5
Micrococcus (species undetermined)	2
Hemophilus (species undetermined)	1
No organism isolated†	4
Total	46

*Four of these cases would be classified as acute bacterial endocarditis.

†Diagnosis unsuspected clinically and noted at necropsy in 1 case; in the other 3, repeated cultures before and after treatment were sterile.

TABLE II. SENSITIVITY TO PENICILLIN OF ORGANISMS ISOLATED FROM ENDOCARDITIS

Organism*	Sensitivity to Penicillin in Units per cc. <0.05	0.1	0.2	0.8	1.6	3.2	>3.2
Streptococcus mitis	12	6		1	1	1	
Streptococcus salivarius		1					
Streptococcus (type undetermined)			1				
Streptococcus faecalis†					1	5	3
Micrococcus pyogenes	2	1			1		1
Micrococcus (species undetermined)		1			1		

*Hemophilus isolated in 1 case: sensitivity to terramycin 1.5 mcg./cc.; to streptomycin <1.5 mcg./cc.; not tested to penicillin.

†One organism found at necropsy only.

*More than one combination employed in several cases before infection was brought under control.

†Treated before short-term therapy with combined penicillin-dihydrostreptomycin was introduced; all 3 organisms penicillin-sensitive.

of endocarditis during the past twenty months. Forty-six cases have been encountered, and the causative organisms isolated in these cases are listed in Table I. In thirty-four of the forty-six cases (74 per cent) streptococci were isolated. It will be noted in Table II that, of the thirty-two strains of streptococci tested *in vitro,* nineteen were sensitive to a concentration of penicillin of 0.1 unit per cubic centimeter or less, while eleven were resistant and two were relatively resistant. Studies of sensitivity were not done in two cases. Nine of the resistant organisms were enterococci (Streptococcus faecalis). Thus, of the thirty-two strains of streptococci tested, penicillin-sensitive organisms made up only 59 per cent of the total. The organisms in four of the seven cases of micrococcal endocarditis were sensitive to 0.1 unit of penicillin or less, and the remaining three were resistant. Hemophilus was isolated in one case and it proved to be sensitive to both terramycin and dihydrostreptomycin.

The treatment employed in these forty-six patients is listed in Table III. It will be noted that only nine (20 per cent) were treated with penicillin alone. In thirty-seven cases (80 per cent) combined therapy was used. In thirty of the thirty-four cases of streptococcal endocarditis, combined therapy consisting of a combination of penicillin and dihydrostreptomycin was used. In five of these cases therapy with terramycin and dihydrostreptomycin was used also but was abandoned because the infection either was not brought under control or relapsed. In four cases of streptococcal endocarditis, penicillin alone was used. If treatment in these four cases were to be instituted today, a combination of penicillin and dihydrostreptomycin would be given. In the cases of micrococcal endocarditis, penicillin alone was used five times and combined treatment with penicillin and dihydrostreptomycin was used once; in addition, inadequate therapy was given once. The single patient with endocarditis caused by Hemophilus was treated with a combination of terramycin and dihydrostreptomycin for two weeks. This resulted in a cure, and the patient has remained well for one year.

Complete follow-up studies are not yet available but it can be stated at this time that the immediate mortality rate (death during treatment or within a month or two) was 24 per cent (death occurred in eleven of the forty-six patients in whom the diagnosis was made ante mortem). The deaths were caused by complications of the disease and consisted of congestive cardiac failure in most cases, cerebral embolism and hemorrhage, renal insufficiency, pulmonary embolism with ventricular fibrillation and extensive septic infarction of the lungs.[4]

Short-term Combined Therapy for Infections Caused by Penicillin-sensitive Streptococci.—For fifteen of the patients in whom endocarditis was caused by penicillin-sensitive streptococci combined short-term therapy with penicillin and dihydrostreptomycin was employed. All these patients have been seen at the clinic in the past fourteen months and they represent a series of consecutive instances of this type of endocarditis. In thirteen of these cases the causative organism was Streptococcus mitis, in one it was Streptococcus salivarius and in one the streptococcus was not identifiable. It was extremely difficult to grow this last organism and its sensitivity was difficult to obtain. The sensitivity *in vitro* of this organism was finally revealed to be between 0.1 and 0.2 units of penicillin per cubic centimeter.

All of the patients were treated for a period of fourteen days except in two instances. These two patients were treated for twenty days because of the prolonged duration of the disease (nine and seventeen months respectively) and because they exhibited debility and undernutrition. In one of these two cases the endocarditis was caused by the unidentified streptococcus just mentioned. Penicillin and dihydrostreptomycin were given together intramuscularly every six, eight or twelve hours. The daily dose varied between 1,200,000 and 2,400,000 units of penicillin and between 1.2 and 2.4 gm. of dihydrostreptomycin.* Most of the individuals received the larger doses. The value for penicillin in the blood when the larger doses were used ranged from 1 to 4 units per cubic centimeter, averaging approximately 2 units.

Response to treatment was good and prompt. The temperature fell to normal either on the same day that treatment was started or on the day after. In one patient, a low-grade fever was present for most of the period of treatment but this disappeared before therapy was completed. Repeated cultures of the blood during and after treatment were sterile in this case. The condition of every patient improved promptly and the cultures of blood became sterile in all cases in which organisms had been found originally.

Of the fifteen patients who received short-term, combined therapy, four have died, three from congestive cardiac failure and one from cerebral embolism. The remaining patients have been well and have had follow-up studies ranging from three to fourteen months. The four deaths occurred on the tenth and eleventh days of treatment in two cases, and ten days and two months following treatment in two cases. Necropsies were done in the two cases in which death occurred during treatment, and cultures at necropsy of the vegetations in one case were sterile.

These results, together with the results obtained by Hunter[15] with ten days of treatment, indicate that short-term, combined therapy with penicillin and dihydrostreptomycin for ten to fourteen days is a practical curative form of treatment for patients with endocarditis caused by penicillin-sensitive streptococci. However, the total number of cases is still small, and more experience is needed before any final conclusions can be drawn. The results thus far are encouraging and warrant continuation of this form of therapy for subacute streptococcal endocarditis that is caused by organisms sensitive to 0.1 unit of penicillin or less. The daily intramuscular administration of 2,000,000 units of procaine penicillin and 2 gm. of dihydrostreptomycin, given in divided doses every six or twelve hours, for ten to fourteen days gives effective levels of antibiotic in the blood and provides adequate therapeutic response.

The average duration of symptoms before treatment in these patients was four months or more. The duration in the four patients who died was 3.9 months, in contrast to a duration of 4.6 months in the patients who responded satisfactorily. This difference does not appear to be significant. If diagnosis had been made and treatment in these cases started early, perhaps in the first month of the disease, the results might have been different. The interval between the onset of the disease and the onset of treatment is one variable that can be controlled by physicians, and it is reasonable to conclude that the results of treatment would be much better if treatment is begun as early as possible. Previous reports indicate that the duration of the disease before treatment is a definite factor in prognosis.

Treatment of Endocarditis Caused by Enterococci.—The *in vitro* and clinical studies of Hunter,[15] Robbins and Tompsett, Loewe and associates and Jawetz and colleagues[9] indicate that combined therapy with penicillin and dihydrostreptomycin is the present treatment of choice for subacute enterococcal endocarditis. The daily administration of 10,000,000 units of penicillin, together with 2 gm. of streptomycin, for a period of four to six weeks has been recommended by Hunter.[15]

---

*We are indebted to Eli Lilly and Company and to Chas. Pfizer and Company, Inc., for the generous supply of the procaine penicillin-dihydrostreptomycin. In most of the cases, a disposable cartridge containing both antibiotics was used for intramuscular injection.

Six of seven patients with enterococcal endocarditis who received adequate combined therapy during this study recovered and have remained well. The seventh patient received 10,000,000 units of penicillin per day for thirty-eight days, together with daily use of dihydrostreptomycin and 2 gm. of probenecid (benemid). Relapse occurred three months after therapy was completed. During the second course of treatment, 15,000,000 units of penicillin per day, together with dihydrostreptomycin and benemid, were given for fifty days. The value for penicillin in the blood was maintained almost continuously at a level that was five times or more the value for the *in vitro* sensitivity of the organism. Cultures of the blood consistently were sterile during the period of treatment. Relapse occurred again one and a half months after treatment had been discontinued. This patient now is undergoing a third course of therapy.

The daily dose of penicillin in the seven patients treated during this study has varied from 6,000,000 to 15,000,000 units given by the method of continuous intravenous drip for twenty-eight to fifty days. Dihydrostreptomycin in doses of 0.5 gm. was given intramuscularly every six hours for the first two weeks of treatment. The dose was then reduced to 0.5 gm. given twice daily for the remainder of the period. Benemid was given in doses of 0.5 gm. every six hours if necessary to produce adequate levels of penicillin in the blood.[5] In the patient who had relapsing enterococcal endocarditis, benemid was given in daily doses of 2 gm. for the first forty days and in doses of 4 gm. per day (1 gm. every six hours) for the last ten days without the appearance of any signs of toxicity.

The dosage and duration of treatment for enterococcal endocarditis are not yet well defined. However, the daily dose of penicillin appears to depend on the *in vitro* sensitivity of the organism, the height of the levels of antibiotic obtained in the blood and the clinical response of the patient. In addition to the relapse just mentioned, two of the other patients who were treated with the smaller doses of penicillin and dihydrostreptomycin for twenty-eight days also had relapses. Control of the infection was then achieved with six weeks of combined therapy. It would appear that six weeks of combined treatment is the safest schedule to employ in enterococcal endocarditis. The incidence of toxicity from the dosage of dihydrostreptomycin used in this study was small. Mild deafness occurred in one of the thirty-four patients in whom combined therapy with penicillin and dihydrostreptomycin was employed; transient vertigo occurred in another on the twenty-first day of treatment (when the dose of dihydrostreptomycin was being changed from 2 gm. to 1 gm. per day), and numbness of the fingertips occurred in a third.

The total number of cases of enterococcal endocarditis recorded in the literature in which combined treatment has been used is not large, and further experience is necessary before any final statements regarding the therapy of this form of endocarditis can be made. It is to be hoped that a more nearly ideal antibiotic will be found, perhaps in oral form, that has penetrative and bactericidal properties. Such an agent will simplify the treatment of this infection.

Treatment of Endocarditis Associated with Sterile Blood Cultures.—In three cases of this series, the clinical picture was unmistakably that of bacterial endocarditis except that cultures of the blood failed to reveal any organisms. Combined therapy, consisting of 5,000,000 to 10,000,000 units of penicillin per day administered by the intermittent intramuscular or intravenous route, together with dihydrostreptomycin, was given for four to six weeks in these cases. The infection was controlled in all three. Treatment in cases of this type should be the same as that used in cases in which the organism is either penicillin-resistant or is an enterococcus. Apparently these patients in whom sterile cultures of blood persist do not do as well when smaller daily doses of penicillin are given.[6]

Summary

The experience in the management of forty-six cases of bacterial endocarditis encountered in the past twenty months at the Mayo Clinic, together with recent trends in the antibiotic treatment of this disease, has been briefly reviewed. Thirty-four of the forty-six infections (74 per cent) were caused by streptococci. Of the thirty-two strains of streptococci tested *in vitro,* only nineteen (59 per cent) were sensitive to penicillin.

The data in a series of fifteen consecutive cases of endocarditis caused by penicillin-sensitive streptococci in which short-term combined therapy with penicillin and dihydrostreptomycin was used are summarized. It would appear that the use of 2,000,000 units of penicillin and 2 gm. of dihydrostreptomycin per day administered intramuscularly in divided doses every six or twelve hours for ten to fourteen days is adequate for treatment in these cases. The total number of cases in which these short periods of treatment have been used is small, and experience needs to be extended considerably before any final conclusions can be made.

The management of subacute enterococcal endocarditis and of endocarditis with sterile cultures of blood is discussed.

Combined treatment was employed in approximately 80 per cent of these forty-six cases, whereas penicillin alone was used in 20 per cent.

Although follow-up studies in these forty-six cases are not yet complete, the immediate mortality rate resulting from complications of the disease was 24 per cent.

Further search is needed for newer antibiotics that can meet the requirements of a more nearly ideal drug for the treatment of endocarditis.

LIPOSARCOMA OF THE TRANSVERSE MESOCOLON

Report of a Case

HARRY B. NEEL, M.D.
Albert Lea, Minnesota

ALTHOUGH benign tumors of fat (lipomas) are among the most common tumors encountered, malignant changes in these tumors and primary malignant tumors of fat are some of the rarest of the malignant lesions. An indication of the rarity of liposarcoma is furnished by the report by Moreland and McNamara of nine cases in 16,000 tumor patients seen at a Veterans Administration facility, the report of one case by McCormick in more than 2,200 personally treated cancer patients, and the fact that Dr. A. P. Stout, who is especially interested in soft tissue sarcomas, has collected only 115 cases from July, 1906, to January, 1949, at Columbia University. It is thought that the rarity of this tumor and the great size which it attains, together with other interesting and unusual features, constitute sufficient reasons for recording our experiences with a case of liposarcoma.

Liposarcomas may be found in any location in which fat is normally present. The most common locations are the intermuscular and fascial planes of the buttocks and limbs and in the retroperitoneal spaces. The tumors are also found in the mesentery, in bones, in the thorax and in the kidney. Liposarcoma of the stomach has been reported.

Liposarcomas may reach a tremendous size. One has been reported weighing 69 pounds and others 63.8, 56, 51, 47 and 38.5 pounds. They are usually well circumscribed, often pseudo-encapsulated and resemble brain tissue. On cursory examination liposarcomas have been mistaken for brain. In the depths of the convolutions a fine network of blood vessels may be found. When the tumor is sectioned, it may be a yellowish color and of slimy or mucinous consistency. Areas of necrosis and hemorrhage and mucoid degeneration are frequently present and there may be small cystic areas. Virchow, the great pathologist, is said to have been the first to describe this tumor histologically, in 1857. The microscopic features vary tremendously. Abnormal growth of the lipoblasts brings about the development of a lipoma or a liposarcoma. The great majority of liposarcomas are primary tumors, but a small percentage may result from malignant change in an already present lipoma. A case is reported in which liposarcoma was found completely surrounded by the tissue of a benign lipoma. The tumor may be a pure liposarcoma, or areas of myxoid cells or round cells may be found, or combinations of myxoid and fibrosarcomatous areas may be present, as well as areas of osseous and cartilaginous metaplasia.

Stout divides liposarcomas into four classes.

1. The well-differentiated type. It is questionable if these tumors ever metastasize.
2. The poorly differentiated myxoid tumor, which is definitely malignant, difficult to eradicate, and may metastasize.
3. The round cell or adenoid type, which may be difficult to eradicate. The cells are large and massed together in close approximation with only a delicate fibrous stroma.
4. The mixed groups which are extremely malignant.

It should be mentioned that Mallory has stated that the pathologic diagnosis of liposarcoma is unusual, and he is rarely confident in making the diagnosis.

In this connection it is interesting to mention a case recently reported by Heinemann and Lehman which they describe as an example of mesenchymal cell embryogenesis. A tumor of the anterior mediastinum was diagnosed as liposarcoma. In three years the patient died, and examination of the original and the autopsy tumor showed pure liposarcoma while the metastasis showed liposarcoma, fibrosarcoma and chondrosarcoma. According to the authors, this indicated that the tumor was in reality a mesenchymoma.

Liposarcomas may occur at any age although the tumor seems to have its predilection for those in middle life. In the recorded cases it appeared slightly more frequently in males.

The treatment of this tumor is wide surgical excision. The tumor cells may extend far outside of the pseudo-encapsulated mass. Good exposure is essential and simple shelling out of the tumor, as is frequently done in simple lipoma, is not sufficient. In the reported cases, radiotherapy has been employed before surgical attack in some cases and following surgical removal in others. There is little indication that this has halted the course of the disease. In the thirty-five cases followed by Dr. Stout there was local recurrence in 66 per cent and metastasis in 34 per cent. Death has ensued in 37 per cent of the cases followed.

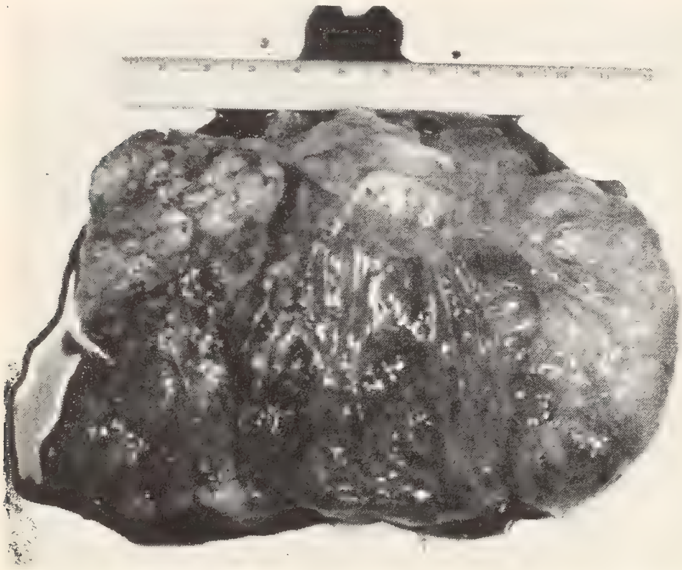

Fig. 1. Gross specimen. Liposarcoma of transverse mesocolon. Segment of attached stomach, the great omentum and segment of transverse colon were removed.

Case Report

A white man, aged fifty-seven, first consulted Dr. Donovan on November 2, 1951. He complained of a gradually enlarging abdomen and of some sharp and dull pains in the abdomen during the preceding two weeks. The patient stated that he had not been feeling well for several months and that his abdomen had been getting larger for about a year. Recently, this increase in size had progressed very rapidly. His appetite had remained good and his digestion was satisfactory. He had had no nausea or vomiting. His bowels moved satisfactorily. He had lost only a small amount of weight. No other symptoms of significance could be elicited.

Physical examination revealed the patient to be a very large man, alert and co-operative. Examination of his eyes, ears and nose gave negative results. The upper teeth had been removed, and the lower teeth were dirty and carious. No glandular enlargement was found. No masses were palpable in the neck. Examination of the heart and lungs revealed them to be essentially normal. Blood pressure was 120/80 millimeters of mercury. The abdomen was very large, rounded and symmetrical. It was flat to percussion. There was a sensation of a nodular mass on the left side. The presence of ascites was suggested. No tenderness was elicited. The lower abdomen seemed to be much softer than the upper abdomen. The genitalia were those of a normal male. Rectal examination was negative.

Laboratory examination revealed the hemoglobin to be 10.20 grams, the erythrocytes 3,700,000, and the leukocytes 8,000 per cubic millimeter of blood.

Radiographic examinations were conducted by Dr. Samuel Miller. On barium enema, the colon was readily filled and the appendix was visualized. There was a rather large mass arising in the mid-abdominal region and displacing the transverse colon downward and posteriorly. This had a uniform homogeneous density suggestive of fluid. Some gas was present in the stomach, and the stomach appeared to be displaced upward and medially. It was concluded that there was a large intra-abdominal mass displacing the transverse colon downward and posteriorly. The diagnostic possibilities were thought to be an omental or pancreatic cyst or a lesion involving the omentum. An examination of the upper gastrointestinal tract was conducted. Both diaphragms were found to be elevated. There was a marked left ventricular cardiac enlargement. The esophagus was normal. The stomach was displaced anteriorly and to the left. The radiologist stated that the findings again suggested either a retroperitoneal lesion or a mesenteric or pancreatic cyst.

The patient was admitted to the hospital and prepared for operation, which was conducted on November 16. Under intratracheal anesthesia a long upper, transverse incision was made. There was a small amount of free fluid in the peritoneal cavity. There was a huge tumor, which occupied the space between the stomach and the colon. It was displacing the stomach upward and the transverse colon downward, but apparently did not arise from either of these structures. General exploration revealed no evidence of metastasis and the liver was everywhere smooth. No glandular enlargement was found. The omentum was dissected away from the transverse colon and reflected upward. This gave access to the huge tumor which was partially cystic and contained a considerable quantity of fluid. The colon was carefully separated from the tumor but it was found that the tumor was a part of the transverse mesocolon and apparentely arose from the transverse mesocolon from which it could not be separated. Our attention was then directed to the stomach which was dissected away from the tumor and it was found that the tumor involved the greater curvature of the stomach. After the dissection was carried as far as possible, it was necessary to remove a wedge of the greater curvature of the stomach. The defect in the stomach was closed with three rows of sutures consisting of fine catgut and finally fine cotton in the serosa. The great omentum was removed in its entirety and the tumor, having been freed from the stomach, was well mobilized. It did not involve the pancreas, which everywhere appeared to be normal. The tumor now was attached to the transverse mesocolon, and by removing a great portion of the transverse mesocolon, the tumor was removed from the patient intact, except for some of the fluid which had leaked out. The mid portion of the transverse colon had been deprived of its blood supply, so approximately 6 inches of colon was removed over the Rankin clamp. The edges of the remaining transverse mesocolon were approximated with a continuous suture of fine chromic catgut. The tumor weighed 10 pounds, so that with the fluid which it contained its weight must have been approximately 18 to 20 pounds. There was no evidence of metastasis to the lymph nodes or to the liver, all of which appeared to be normal. The wound was closed with chromic catgut in layers and with the two loops of bowel being brought out through the mid portion of the wound. During the procedure the patient received some intravenous fluids and approximately 3 units of blood. His condition remained good throughout the operation and he was returned to his room in good condition.

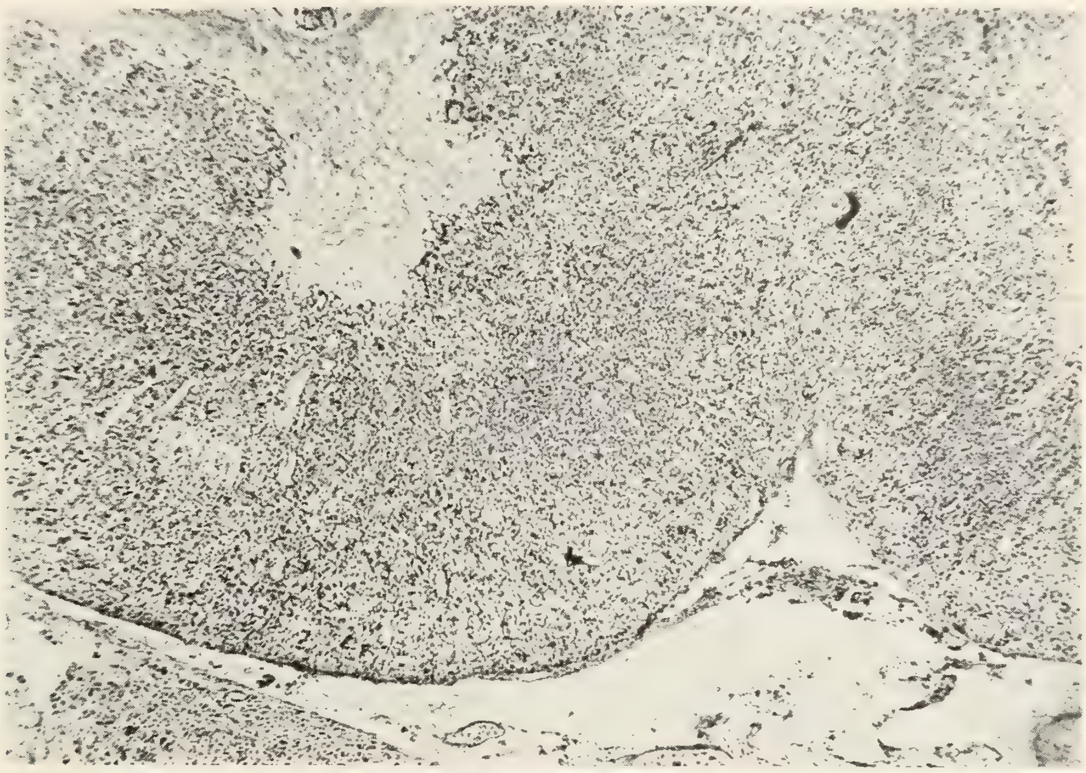

Fig. 2. Microphotograph of representative area of the undifferentiated and highly malignant liposarcoma.

The pathological examination was conducted by Dr. R. W. Koucky. The tumor, after loss of its fluid, weighed 10 pounds. Dr. Koucky described the specimen as follows: "The mass measures 29 by 24½ by 10 cm. and has been previously weighed as 10 pounds. The central part of the mass has degenerated and is replaced with necrotic hemorrhagic material. In the remaining peripheral portions of the tumor there are many other areas of hemorrhage and beginning cystic and mucinous degeneration. The external surface of the tumor is rough and irregular, and apparently the tumor had been adherent within its bed. The surfaces show moderate lobulation. The peripheral part of the tumor is intact, and this has a greyish color and is soft and friable, and occasionally the tumor has developed a yellowish color and in some areas has a mucinous texture. With this there is a large mass of omentum which shows no evidence of implantation and a segment of normal appearing colon about 10 cm. in length. The appendix is also included and shows no evidence of any tumor implants.

"Microscopic sections have been taken from various parts of the tumor. The tumor shows considerable variation in structure in the different portions. In areas there is an extremely active growth of spindle-shaped cells which are so highly undifferentiated that their structure is completely lost. A tremendous number of mitoses appear in this portion. Other areas show a very excellent differentiation of the spindle shaped cells into fat. Sometimes even mature appearing fat cells are seen. The gelatinous parts of the tumor show considerable extra-cellular gelatinous material, and in these areas the tumor is almost like fetal connective tissue. Section of the appendix shows no evidence of any implants.

"Diagnosis: Liposarcoma, grade IV; inactive appendix; segment of colon and mesentery."

The patient was discharged from the hospital on November 26, 1951, feeling well and with his colostomy functioning well. He returned on December 15 for preparation and closure of the colostomy and was discharged again on December 22, 1951. He has remained well to date and has returned to his occupation as a laborer in a meat packing plant.

In conclusion, a case of liposarcoma, presumably arising from the transverse mesocolon, has been reported. These are rare tumors which are extremely malignant and which reach an enormous size. The possibility of malignant change in simple lipomas, although rare, has been mentioned and should be kept in mind when dealing with soft tissue tumors. Liposarcoma is a tumor which

(Continued on Page 880)

VALUE OF THE FLAT PLATE (X-RAY) IN DIAGNOSIS OF ACUTE ABDOMINAL CONDITIONS

E. C. PAULSON, M.D.
Worthington, Minnesota

IN THE first place I would like to suggest that the term "flat plate" should be abandoned as obsolete and somewhat ambiguous. A much better term in my opinion is "scout film." Other x-ray procedures may be indicated. The most usual added procedure is an upright view of the abdomen. In fact, this is routine in most x-ray laboratories, and I think should always be routine in the investigation of acute conditions of the abdomen.

It is very important to know how to get the most out of the roentgenogram, once it has been taken. Without the clinical data of the case in question, much of the value of the roentgenogram of the abdomen may be completely lost. Consequently, the patient's history, pertinent physical findings, and laboratory findings should be available to the one who is to interpret the roentgenogram. It is important to know about previous operations. It is a well known fact that most cases of small bowel obstruction follow previous operations and that pelvic surgery is the greatest offender in this respect. Another piece of data which should be available to the one reading the roentgenogram is whether or not the patient has had a cleansing enema during the hour or two preceding the x-ray. Usually, when an enema is administered, more or less air is introduced into the distal colon. In case bowel obstruction is being considered, this introduced air may confuse the x-ray findings considerably. If one knows that an enema has been given and that air may have been introduced in this way, it may be allowed for in the x-ray interpretation. Also, it is desirable to know whether or not the patient has recently had any radiopaque medication.

In the interpretation of any kind of x-ray film one should have some kind of routine to follow in order that he will not miss any of the information afforded by the film. In x-ray interpretation it is axiomatic that one sees what he looks for, and it is only by carefully examining all of the features of the film that one will get all the information that it affords. I would suggest that one begin by looking carefully at all of the bony structures: the spine, the ribs, the pelvis, and the hips. The things to look for, of course, are fractures, metastases, and anomalies. An unsuspected fracture or metastasis may explain the whole symptom complex of the patient.

After the bony structures have been examined one should turn to the soft tissue shadows: the spleen, kidneys, psoas muscles, liver, bases of the lungs, diaphragms, and any other organs that are visible. One should attempt to delineate each one of these organs in turn and note any alterations in shape, position, or size. This is a good time also to look for any evidence of gas in the bile ducts which would indicate a communication between the intestinal tract and the gallbladder. Gas under the diaphragms indicative of gastrointestinal perforation is usually visible only on an upright or lateral decubitus film.

The next feature to be evaluated is the calcifications which may be present. In the upper abdomen, most calcifications are related to the rib cartilages and in the lower abdomen the most common calcifications are phleboliths in the pelvis. In older people, various vascular calcifications are common, such as calcifications of the splenic artery, the abdominal aorta, and the large pelvic vessels. The classical case of gallstones is very readily apparent but sometimes gallstones are demonstrated only by very faint calcific rims. Ureteral stones are distinguished from phleboliths by their angular shape. Phleboliths are always round and often hollow in the center, whereas ureteral stones are angular and usually not quite as dense as phleboliths. Various calcific possibilities which may occur are too numerous to mention but they include pancreatic calculi, the presence of teeth in dermoid cysts, kidney tumors, and uterine myomas. From the radiological viewpoint it is a fortunate happenstance that nature introduces calcium into many pathological entities so that they may be identified in this way.

The last feature to be analyzed on the film is the nature of the intestinal gas distribution and it is here that one is most apt to run into difficulties.

Round Table discussion held during the annual meeting of the Minnesota State Medical Association, Minneapolis, Minnesota, May 27, 1952.

It is sometimes very difficult to distinguish an adynamic ileus from an intestinal obstruction. In the classic case of adynamic ileus the gas is rather evenly distributed throughout the small and large bowel. After the period of infancy and early childhood it is not normal for gas to be present in the small bowel. In the classical case of simple intestinal obstruction, gas is present proximal to the lesion and absent distal to the lesion. There are many exceptions and variations, however, to this rule. In an early case of lower small bowel obstruction, the gas which is normally present in the colon may not have had an opportunity to be evacuated as yet and its presence will confuse the picture. In a case of a partial small bowel obstruction some gas will be seen distal to the lesion although it is relatively less than what is shown proximal. In cases of closed loop small bowel obstruction which are among the very common types since they are associated with postoperative adhesions, a small bowel loop becomes twisted in such a way that gas can enter it from the proximal end but cannot find an exit at the distal end. Consequently, the air which is passed from the stomach into the small bowel finds its way into this loop; and gradually this single loop becomes more and more distended, without any gas being present in other small bowel loops. It is only when this effected loop becomes fully distended that the gas begins to pile up in the small bowel proximal to the lesion. These greatly distended isolated small bowel loops very often resemble a portion of the colon and may be difficult to identify. Another confusing feature is that what starts out as an adynamic ileus may turn into an obstruction at some point, so that features of both conditions are present.

From the practical standpoint then, one may justifiably ask the question: just exactly what type of information can be obtained from a scout film of the abdomen? It is assumed that the patient has already been studied from the clinical standpoint and that certain diagnoses are being considered. The x-ray examination may reveal appropriate information so that a single definite diagnosis can be made. On the other hand sometimes certain diagnoses that have been considered may be definitely ruled out. A careful perusal of the roentgenogram may reveal secondary diagnoses which were never thought of in the initial work-up of the patient but which are important in his over-all consideration. One of the best examples of this is the revelation of an unexpected pregnancy. Even where the best medicine is practiced, it happens occasionally that an advanced pregnancy goes entirely undiagnosed until the abdomen is opened. Sometimes the results of the x-ray examination are equivocal. This is particularly true where the distribution of the intestinal gas would be consistent with either an early case of intestinal obstruction or an early case of adynamic ileus. If the rest of the clinical work-up has not contributed a more accurate diagnosis, it is sometimes advisable in these cases to wait several hours and repeat the roentgenograms. Comparison between the two sets of roentgenograms may show which direction one should turn in his interpretation. I suppose the most common roentgen interpretation which is made of abdominal films is that of normal findings. The clinician is then thrown back upon his clinical and laboratory findings and should not be unduly prejudiced by the normal x-ray interpretation. The x-ray interpretation, of course, is a laboratory finding like others, and it must not be allowed to mislead one in his conduct of a given case if other data point very definitely in a different direction.

In summarizing, I would like to reiterate that the scout film of the abdomen can contribute very pertinent information. In its interpretation, a systematic routine should be followed in order that none of its features will be missed; and the one who is interpreting the film should have available the salient clinical data.

PRACTICAL NURSES AND HOMEMAKERS FOR RURAL MINNESOTA

(Continued from Page 849)

tinuing in practical nursing. Only one has left the state and she is employed in California.

These graduates feel they have had the advantage of an opportunity to prepare themselves as licensed practical nurses, as future homemakers and as informed active citizens in their respective communities. This combined preparation in practical nursing and home management seems significant in meeting needs that arise in hospitals and situations involving homemaking responsibilities.

President's Letter

MEDICINE'S ANSWER

American organized medicine has answered the challenge. It has worked to produce a system of voluntary health insurance plans throughout America which would serve as an answer to the proponents of government-controlled compulsory health insurance. Those proponents have long challenged medicine to provide better protection against the emergency costs of medical care.

Development of vast numbers of voluntary health insurance plans has been continuing and progressing rapidly during the past few years.

Since 1940, when there were only fifteen voluntary health insurance plans in existence, this development has increased to a point where there are now eighty-four such plans operating in the United States. Every one of these eighty-four plans is sponsored or approved by the medical profession or co-ordinated with local hospital insurance plans.

Over the years voluntary health insurance has progressed as follows: in 1940, six new voluntary plans were established; four in 1941; three in 1942; six in 1943 and 1944; fifteen each during 1945 and 1946; twelve during 1947; two during 1948; five during 1949; four during 1950 and three during 1951.

The growth in enrollment in these voluntary health insurance plans, although not as rapid, has shown a steady increase.

At the end of 1945, 2,840,000 people were enrolled in voluntary health insurance plans sponsored or approved by the medical profession or co-ordinated with local hospital benefit plans. This number increased to five million during 1946. By the end of 1947, 7,300,000 subscribers and dependents were enrolled in these programs. This figure increased in 1948 to 10,600,000. The number enrolled was 14,600,000 by the end of 1949, and almost 20 million persons were protected by December 31, 1950. By December 31, 1951, almost 24 million persons were insured.

In addition, commercial insurance companies and fraternal societies had insured approximately 50 million individuals against hospital, surgical and medical expenses through December 31, 1948.

Growth in numbers of persons protected and number of plans operating does not indicate the full story. It should be noted that this type of protection is subject to almost constant change and development. The basis of payment of many programs has been expanded and the amounts of many benefits have been adjusted to keep pace with economic trends.

This continued increase in enrollment and in the number of voluntary health insurance plans is proof of public acceptance of the idea of preplanning and budgeting some of the costs of illness, injury and disability.

Also, it is striking evidence of the role American medicine has played in continuing to provide more and better medical care for the people of the United States.

It is reasonable to assume that this growth will not stop at this point. However, proponents of government medicine are still active. Organized medicine, and those interested in curbing further government control of private fields, can continue to work for greater progress in this field, for this progress, no matter how impressive, cannot be considered the ultimate answer. Development will continue, for the medical profession will not be satisfied with the status quo.

BACK DOOR ENTRANCE

JUST as the medical profession had come to feel rather complacent at having apparently averted for the time being, at least, the threat of compulsory government health insurance, there now looms on the near horizon the possibility of a back-door entrance of this highly undesirable proposal by means of our country's various international commitments.

The International Labor Organization which has been in existence some thirty-five years and of which our government is a member, met in conference last June in Geneva, Switzerland, and approved a so-called "convention" on minimum standards of social security. This included medical care, sickness benefits, unemployment benefits, old-age benefits, employment injury benefits, family benefits, maternity benefits, invalidity (disability) benefits, and survivor benefits. A "convention" is in the nature of a treaty and requires a two-thirds vote by the U. S. Senate only for ratification. A county may ratify this ILO convention if it promises to meet at least four of the nine benefit programs enumerated.

This convention stipulates that "a ratifying country may provide a system of compulsory health insurance to take care of its workers." Voluntary health insurance is acceptable only if (1) it is supervised by public authorities or administered by joint operation of employers and workers according to standards set by public authorities and (2) it covers a "substantial part" of persons whose earnings do not exceed those of skilled employees. Medical care benefits under the convention would have to include (1) general practitioner care; (2) specialists' care; (3) essential pharmaceutical supplies; (4) hospitalization.

It would seem that if the convention of the ILO is adopted by the Senate and medical care is one of the four benefit programs specified, we shall have substantially federally controlled medicine.

While it is said that the chances of ratification of this convention by the Senate are at present slight, there is no time limit as to when the convention may be submitted for ratification. The ILO constitution, however, attempts to set a limit by stipulating that a member country shall place the convention before its legislative body not later than eighteen months after the close of the ILO conference at which it was adopted. Physicians will therefore have to be on the alert to prevent the adoption of this convention by the Senate without warning at any time within the next two years.

There is reason for some concern lest certain un-American ideologies become serious threats to our American way of life as a result of our international dealings. This convention on minimum standards of social security approved by the ILO at Geneva, Switzerland, in June is an example. Socialistic policies have dominated the ILO and when it requested and received a statement by a group of consultants from the World Health Organization on the subject of medical provisions which should be included in the proposed convention, the socialistic character of the WHO consultants was evident. They discarded from consideration the concept of fee for service and lauded the salary basis for providing medical care. No practitioner of medicine was included in this group of consultants, and the United States representative was Dr. Henry E. Sigerist, formerly of Yale University and at present a resident of Switzerland. As a result of this statement by the WHO consultants, the Secretary General of the World Medical Association sent a statement by the Council of the World Medical Association opposing the philosophy of socialism and lauding that of private enterprise to ILO members. In spite of this action, the convention favoring assumption of medical activities by the government was recommended by the ILO.

In condemning socialism in general, we equally heartily condemn the ideas which are expressed at times in print condemning nationalism which means patriotism. We trust that the suggestion that history be rewritten, omitting the outstanding accomplishments of countries, our own in particular, in an effort to quell the fervor for patriotism will not succeed. Patriotism is love for one's family and neighbors and will always be a noble passion. Keen as we are for co-operation between nations in the interest of world peace, we are just as firmly opposed to having our way of life altered by foreign countries.

CHLOROMYCETIN AND BLOOD DYSCRASIAS

IN VIEW of the reports which have been appearing in the literature of blood dyscrasias (aplastic anemia, thrombocytopenic purpura, granulocytopenia, and pancytopenia) following the use of chloramphenicol (Chloromycetin), an investigation was undertaken by the Food and Drug Administration of the Federal Security Agency, the National Research Council's Division of Medical Sciences and the manufacturer, Parke-Davis and Company.

A committee of oustanding authorities on hematology and infectious diseases headed by Dr. John Holmes Dingle, Professor of Preventive Medicine at Western Reserve University, Cleveland, Ohio, reviewed the records of some 410 cases of serious blood disorders, of which 177 were definitely known to have been associated with the use of Chloromycetin. In sixty-one of the 177 cases, Chloromycetin was the only drug administered while other drugs had also been given in the remaining 116 cases. In both groups there had been a 50 per cent mortality. A group of sixty-five more cases in which Chloromycetin may or may not have been involved continues under investigation. The number of fatalities is small in view of the 8,000,000 patients who have received the drug.

A report of a special committee of the National Research Council's Division of Medical Sciences of which Dr. M. C. Winternitz is chairman, concludes that serious cases of blood dyscrasias following the use of Chloromycetin are uncommon but of sufficient importance to warrant a warning on the label of the drug against its indiscriminate use or for minor infections. When prolonged or intermittent administration is required, adequate blood studies should be carried out.

In other words, Chloromycetin is a valuable drug but like so many others should be used with care and only where definitely needed. The fact that its use has been associated with a certain number of fatalities does not outweigh its therapeutic value in certain infections. It will still be available on prescription.

MINUTE WOMEN POLITICALLY MINDED

IN our June issue appeared an editorial entitled "Minute Women." Having heard an address by Suzanne Silvercruys Stevenson, we were much impressed by the avowed purposes of the organization known as "Minute Women." We still heartily endorse all of them. Imagine our surprise, however, when Mrs. Stevenson in the *Newsletter* of the organization for June 15 came out strongly for two candidates for the presidency and as strongly opposed others—this by the head of an organization which claims to be a "nonpartisan group." We were not too surprised therefore, to learn in the letter sent out under date of August 11 by the Minute Women that Suzanne Stevenson is disassociating herself temporarily from the organization in order to accept the position of co-chairman and treasurer of the new political party recently formed in Chicago and more recently named the Constitution Party. Apparently Mrs. Stevenson was unable to keep herself and the Minute Women out of politics. She is correct in severing her relations with the organization but should have refrained from utilizing the organization's *Letter* for voicing her political preferences. We shall be interested to observe whether Minute Women will adhere in the future to its claim of being non-partisan in character.

THE HOSPITAL DOLLAR

The following is a condensation of a talk given by Mr. George Wood, administrator of Peralta Hospital, to members of the Medical Staff. Mr. Wood was asked to make his manuscript available to the Editorial Board for publication in this issue of the BULLETIN.

"This bill is terrible, and I'm not going to pay it!" The hospital cashier was having a bad time with the husband of a patient. "How can you expect a working man like me to pay $128 for three days of care? What we need is hospitals run by the government."

The man's wife had been brought into the hospital for an emergency appendectomy three days before. The bill, broken down, covered $52.50 for the room for three days, $60.00 for the surgery, $10.50 for routine laboratory, and $5.00 for drugs, et cetera.

The man did pay the bill finally—a little sheepishly and shamefacedly, after he was favored with a cool and friendly analysis of the charges and a comparison of them with his own economy.

The man was a plumber. He was asked, first, if the service his wife had received was satisfactory, and he agreed that the meals were good, the linen was clean, the nurses were courteous, competent, the hospital was obviously carefully and effectively operated in every way. He had no complaint as to the prompt and competent treatment of the patient.

"What would it cost the hospital," he was asked, "if you were to provide it with plumbing service over a continuous three-day period?"

Medical Economics

Edited by the Committee on Medical Economics
of the
Minnesota State Medical Association
George Earl, M.D., Chairman

LIVING COSTS MORE THAN MEDICAL CARE

According to a recent release by the American Medical Association Bureau of Medical Economic Research, the index of the prices of all items in the consumers' budget has risen almost twice as many points as the price of medical care. The report, presented by the bureau's director, Dr. Frank G. Dickinson, states:

> "The Consumers' Price Index rose 13.7 points in 1951, and the index of medical care and drugs rose 7.1 points. In 1951, the Consumers' Price Index reached an all-time high of 185.6 while the index of the prices of medical care and drugs stood at 155.0. While the Consumers' Price Index has been considerably higher than the index of medical care prices in recent years, the spread between the two indexes became even more pronounced during 1951. The Consumers' Price Index had risen 86% since the base period, while the cost of medical care rose only 55%. In terms of purchasing power of the consumer dollar, medical care was 16% cheaper in 1951 than in 1935-1939, that is, 155.0 is 84% of 185.6."

The article went on to explain that the Consumers' Price Index is a widely used index of prices of goods and services in the United States. The report says that "the Consumers' Price Index, which is compiled by the U. S. Bureau of Labor Statistics, measures monthly the changes since 1935-1939 in the prices of fixed quantities of goods and services normally purchased by moderate-income families in large cities. The indexes of the medical care items are a small part of the entire index. This index is considered our best general measure of the purchasing power of the consumer dollar and is widely used to determine wages in labor negotiations."

Item Prices Noted

The Bureau report expands its discussion of medical care prices by reporting individual item changes during the past year. It lists separate items as: "the index of medical care excluding drugs was 160.9 in 1951 and the index of prescriptions and drugs, 128.4. The index of physicians' fees (general practitioner, surgeon, and specialist) was 145.2; of general practitioners' fees, 145.2; and of surgeons' and specialists' fees, 144.3. The index of dentists' fees was 160.0 and of hospital rates, 260.7. The price index of group hospitalization, which was recently added to the items priced by the Bureau of Labor Statistics (December, 1950—100), was 103.1 in 1951; thus group hospitalization (Blue Cross premium rates) rose 3.1% during 1951, the first full year covered by this newly added index."

The report emphasizes that with the exception of hospital rates, the indexes of each medical care item were considerably below the Consumers' Price Index. In fact, it is seen that if the hospital portion of the index of medical prices were excluded, this index would be even lower than the reported level of 155.0.

Hospital Costs Interpreted

Because hospitals are buyers of large quantities of food and labor, the report stated that they feel the full impact of inflationary forces: "They must adjust their rates to cover the vastly increased cost of the materials they purchase. The hospital's costs are not stabilized by such customary accounting items as depreciation and taxes, because most hospitals are charitable institutions."

Dr. Dickinson also noted that the hospital index may also be uniquely affected by the choice of the base period. He says:

> "While 1935-1939 is considered a relatively normal period by most economists for the purpose of general comparisons, in the case of hospitals it may have some shortcomings. For example, the shortening of the nurses' working day to eight hours, which would considerably affect the labor costs of hospitals, was not fully realized until after 1935-1939. . . . The index of hospital prices is for room rates only. The prices of laboratory and other services are not sampled. The index of prescriptions and drugs does not cover any of the 'wonder drugs' of recent years."

CONGRESS TRIMS PUBLIC HEALTH BUDGET

The slow process of obtaining funds by federal appropriation, and the many congressional and committee storms an appropriation bill must weather, are seen in the United States Public Health Service budget for fiscal 1953. The amount granted by Congress, although lower than current year expenditures, is enough to keep programs going at about their present pace.

According to a recent article in *Modern Medicine* the budget is a fair example of the amount of money Congress is willing to spend on health activities, such as grants to states and federal research and educational work. The article states, "This year all Public Health Service spending will total around $348.5 million. When, last fall, PHS officials started conferring with Budget Bureau officials on next year's budget, they asked for a considerable increase, although they are not permitted to disclose just how much. But the Budget Bureau decided that, everything considered, PHS should not spend more than $302.5 million in the next fiscal year. That was the total of requests the Bureau allowed to be submitted to Congress."

The article described the next process:

> "Next, subcommittees of the House Appropriations Committee called PHS officials up on Capitol Hill to justify individual budget items, one at a time. When this generally painful process was concluded, the full committee looked over the resulting figures and set a maximum expenditure of $280 million, a reduction of about 8% from the Budget Bureau figures."

After House passage of the budget, the figure was $800,000 short of the original amount. But, the article stated, "the experienced men knew that all was not lost; there was still the Senate."

Senate Increases Figure

Eventually the Senate Committee made an independent estimate of what the PHS should have to spend—$283 million, an increase of several percentage points over the House figure.

It is interesting to note that the Senate Committee voted substantial increases in funds for cancer and heart disease research and grants. The article comments: "Some persons who have watched the process for years believe there's a relationship between these particular annual increases and the hope of some senators that cures will be perfected in time to save them personally. Whatever reasons the senators may have, funds for cancer and heart work were increased a total of more than $5 million."

The House and Senate comparative figures read thusly:

Cancer Institute—$15,371,000 asked, $15,250,000 approved by the House Committee and House; $17,887,000 approved by Senate Committee.

Heart Institute—$9,749,000 was asked, $9,600,000 approved by the House Committee and House; $12,000,000 approved by Senate Committee.

The Senate Committee also recommended $195,000 more than the House for mental health work and $50,000 more for the National Institutes of Health.

The ease with which the Senate seems to be able to appropriate funds for health and health research purposes, would indicate these things: possibly they are extra anxious to have health standards continue to improve above the present high level; and/or they would be equally vulnerable to arguments requesting increased appropriations to run compulsory health insurance, should such a thing occur in this nation. The medical profession will do well to keep an ever-watchful eye on such impressionable people as our senators and representatives have proven themselves to be.

NATIONAL HEALTH PLAN SPONSORED BY UNION

Proving that the issue of compulsory national health insurance is not dead, the recent 18th biennial convention of the Amalgamated Clothing Workers of America has passed a national health insurance resolution.

The labor union takes cognizance of, but doubts the value of, the progress made in the nation's health under the present voluntary system of doing things. It says that despite the tremendous advances in medical science achieved in recent years, the health needs of this nation have not been met. There are too few doctors, nurses, hospitals, clinics and medical schools, the group asserts, and the cost of these services makes it impossible for a great many Americans to obtain adequate medical care.

And then it advocates blindly the system that will stymie the present progress of medical science. It states:

> "Resolved, that the 18th biennial convention of the Amalgamated Clothing Workers of America (1) Calls upon Congress to pass legislation establishing a nation-

wide health insurance program which will provide the people of our nation with the needed medical services, facilities and personnel. (2) Urges the passage of a federal assistance program to professional medical and nursing schools through scholarships and grants to students . . ."

THE MINNESOTA STATE BOARD OF MEDICAL EXAMINERS

230 Lowry Medical Arts Building
Saint Paul 2, Minnesota

Julian F. DuBois, M.D., Secretary

SUPREME COURT OF MINNESOTA DECLARES VITAMINS TO BE DRUGS AND MEDICINE

Re. Milton Culver doing business as Culver's Food Market vs. John Nelson, John J. Pastenacki, Victor E. Feit, J. Norman French, B. A. Deterling and F. W. Moudry. (Minnesota State Board of Pharmacy.)

The Supreme Court of Minnesota, in a unanimous decision, has held that pure and concentrated vitamins or combinations of pure and concentrated vitamins, natural or synthetic, carried in an excipient, solid or liquid, and offered for sale as tablets, capsules, or in liquid form, are drugs within the meaning of the laws of the State of Minnesota. The lawsuit was instituted by a grocer, Milton Culver of the City of Saint Paul, Minnesota, who sought a declaratory judgment to determine his right, and those similarly situated, to sell at retail, tablets, capsules or liquids, containing vitamins, in their original packages as prepared by the manufacturer or distributor. The case was first tried in the District Court of Ramsey County before the Hon. Albin S. Pearson who held that the plaintiff had no right to sell such vitamins. An appeal was taken to the Supreme Court of Minnesota by the plaintiff.

In its decision the Supreme Court of Minnesota also held that such vitamins are not common household preparations sold exclusively for nonmedicinal purposes. The Supreme Court, likewise, held that such vitamins are not excepted from the operation of the laws of the State of Minnesota as being non-habit forming, harmless proprietary medicine. Lastly, the Court held that such laws are not in violation of the constitution of the State of Minnesota. In its decision the Supreme Court stated:

> "The opinion of the many eminent specialists in the field of medicine and chemistry called by defendants is that the vitamin products here involved are drugs. We conclude that they meet all the requirements under the definition of a drug in our statute."

The decision of the Supreme Court makes it clear that under the laws of the State of Minnesota the sale of vitamins is restricted to licensed and registered pharmacies and to licensed and registered doctors of medicine. From a public standpoint, the decision is extremely important and will be heartily approved by the medical profession as well as the pharmaceutical profession. The State of Minnesota was represented in the case by the Hon. J. A. A. Burnquist, Attorney General, and by George B. Sjoselius, Deputy Attorney General.

THE HOSPITAL DOLLAR

(Continued from Page 874)

"Plumbers rates are $22.00 for an eight hour day," he replied.

"What about the two night shifts?" he was asked.

"Those would be at double time. That would be $44.00, each."

"So the cost for one day of constant attendance by one plumber would be $110.00."

"That's right. And for three days, it would be $330.00."

"And that's for wages alone. It doesn't include material. It takes more than 400 full-time employes to operate Peralta Hospital—2½ employes for every patient, or 5/6ths of one person's efforts, around the clock, for your wife. In addition to this time, the hospital supplied food, linen, medication, surgical equipment, laboratory services, telephone services, dressings and techniques and skills which are at least as specialized as those of a skilled trade such as yours. In addition, the hospital assumed a tremendous responsibility for the safety of your wife."

There was a pause. "Do you still think your bill is too high?"

"For the first time," he said, "someone has taken the time to explain hospital charges to me, in language I can understand."

As gracefully as he could, the husband went out and paid his bill. He left with a good feeling.

The incident inspired some further analysis of comparative hourly costs of hospitalization compared with going rates among skilled trades. An electrician's rate per hour is $2.75, a machinist's $2.41, a teamster's $1.81, a laborer's $1.70. An analysis made of 70,516 patients admitted to Bay Area Hospitals during 1951 represented 374,027 patient days, or 8,976,648 hospital hours. Total money paid by these 70,516 patients was $10,003,042, a cost of $1.11 per hour, for all hospital services, including laboratory, surgery, et cetera.

The prevalent public misunderstanding of hospital charges is a good example of our failure in communications.—Reprinted from the *Bulletin of the Alameda-Contra Costa Medical Association,* June, 1952.

HOSPITALS CLOSED FOR LACK OF FUNDS

The Public Health Service is being forced to close four of its general hospitals as a result of Congressional cuts in Veterans Administration appropriations, Oscar R. Ewing, Federal Security Administrator, announced recently. He explained that funds cut would have provided contract care for Veterans Administration patients in Public Health Service hospitals.

The hospitals, located in Kirkwood, Missouri, Mobile, Alabama, Portland, Maine, and San Juan, Puerto Rico, will discontinue admitting patients within a few days and will be converted to outpatient clinics as soon as provisions can be made for their present patients.

Dr. Leonard A. Scheele, Surgeon General of the Public Health Service, stated that this unexpected cut amounts to about $1.5 million and requires a reduction from 650 to 375 in the number of Veterans Administration patients cared for by the Public Health Service.

Patients in Public Health Service hospitals include American merchant seamen, officers and enlisted men of the Coast Guard, Federal employes injured in line of duty, and others for whom the Service is responsible under law.

AMERICAN MEDICAL ASSOCIATION

House of Delegates—Summary of Proceedings

Chicago—June 9-13, 1952

The House of Delegates convened on Monday, June 9, in the Red Lacquer Room of the Palmer House, Chicago, and was called to order by the Speaker, Dr. F. F. Borzell, at 10 a.m.

After preliminary proceedings including the invocation, the roll call and adoption of proceedings of the clinical session in Los Angeles, the House elected a Vice Speaker, Pro Tem, in the absence due to illness of the regular Vice Speaker, Dr. James R. Reuling. Dr. E. Vincent Askey of California was elected. Dr. Paul Dudley White of Boston was elected to receive the Distinguished Service Award.

The House then heard the address of the Speaker which paid tribute to the high quality of men comprising the House of Delegates and the fine work they are doing. The Speaker then read the names of members of reference committees.

The address of the President, Dr. John W. Cline, was then heard by the House. Presenting a résumé of the past year's accomplishments, Dr. Cline stated that American medicine is "stronger, more unified and better able to prevent the destruction of the high standards of medical care inevitable in socialistic schemes."

The Speaker then presented to the House the President-Elect, Dr. Louis H. Bauer, and Dr. Ernest E. Irons, Past President, who presented invited guests.

President's Commission

The House considered a resolution regarding the President's Commission on Health Needs of the Nation, and after considerable discussion passed the following resolution: WHEREAS, The House of Delegates for many years has clearly enunciated principles of policy for dealing with problems concerning the health needs of the Nation; and WHEREAS, the Officers and Board of Trustees of this Association have diligently followed these principles; now therefore be it RESOLVED, That the conduct of the officers and Board of Trustees regarding the President's Commission is a re-affirmation of the principles subscribed to by the vast majority of the members of the American Medical Association.

Report of Board of Trustees

Dr. Dwight H. Murray, Chairman of the Board of Trustees, presented his report. He reported that the Association will have a decrease in revenue of approximately $250,000 from discontinuance of the Fellowship classification. His report also included recommendations and discussions of: deferment of students, reactivation of the Fellowship classification to include donors to the American Medical Education Foundation, tax deductions for postgraduate study, certain legislation of the 82nd congress, fluoridation of public water supplies, the "Legislative Review," the invitation for the 1955 convention, civil defense, honoraria for president and president-elect, Advisory board to Board of Trustees, Advisory Committee on Policy, Washington property, local health councils, dues for 1953, uniform types of membership, Health Home Council, case finding methods, general practitioner's award, S. 1140, certification of clinical psychologists, H. R. 7800.

The report was referred to proper reference committees. The report was discussed section by section. Approval was given to the Board's recommendation of a $50 a day honorarium for the president and president-elect in handling Association business, broadening the scope of the Advisory Committee on Policy, continued search for suitable property in Washington for permanent headquarters for the Washington office, $25 dues for 1953.

The Reference Committee on Medical Military Affairs approved the Board's recommendation pertaining to coordination between the Federal Civil Defense Administration and military organizations.

The Reference Committee on Miscellaneous Business recommended that the Board of Trustees be authorized to appoint a committee to study the problem of uniform types of membership. The committee concurred in the Board's recommendation that the House be freed from the responsibility of electing the outstanding general practitioner of the year.

The Reference Committee on Hygiene and Public Health approved the Board's request in regard to setting up a Health Home Council and added two minor changes and outlined some basic requirements.

The Reference Committee on Insurance and Medical Service approved the Board's acceptance of a proposal to encourage development, in offices of physicians, of case finding methods for tuberculosis, of a type even more effective than the services provided by voluntary health agencies and departments of public health in mass surveys. The committee takes cognizance of the work done by the Board-appointed committee on Federal Medical Services. Final reports of this committee will be heard at the December interim session.

The Reference Committee on Legislation and Public Relations concurred in approval of the resolution favoring establishment of a federal board on hospital services to determine the need and location of proposed new federal hospitals.

The Reference Committee on Medical Education and Hospitals recommended disapproval of a resolution to foster establishment of state boards for certification of clinical psychologists.

The Reference Committee on Legislation and Public Relations favored adoption of resolutions relative to a proposed amendment to the U. S. Constitution prohibiting making of any treaty or executive agreement which is in conflict with the Constitution or which may operate to regulate any of the purely domestic affairs of the United States.

After the Speaker introduced the delegates from the Student American Medical Association, the House heard the report of the American Medical Education Foundation, presented by Dr. Elmer L. Henderson, the Foundation's president. Dr. Henderson reported that the sum contributed so far by individual physicians is $121,000.

Dr. Elmer L. Henderson then presented the report of the Co-ordinating Committee, and this was approved by the House.

The report of the Reference Committee on Amendments to the Constitution and By-Laws was approved by the House, adopting changes making single membership classification a part of the constitution, and restricting terms of office of members of standing committees.

The report of the Council on Medical Education and Hospitals was read by Dr. H. G. Weiskotten, and approved by the House.

The report of the Committee on Blood Banks was read by Dr. Herbert P. Ramsey, Co-Chairman, which was approved and commended. It reported progress on blood procurement programs and related fields.

The House approved a resolution commending the heroic efforts of Dr. Walter H. Roehll in helping passengers of the train stalled in the Sierras last winter.

The House adopted a resolution requiring the records of the Judicial Council to be made into a permanent file, for availability to the membership on discretion of the editors of the *Journal of the American Medical Association.*

The House adopted a resolution requiring provision of Alternate delegates with badges for House sessions.

The House resolved to request the Council on Constitution and By-Laws to study and re-evaluate the Principles of Medical Ethics and report back its recommendations.

The House approved a resolution condemning the International Labor Organization's proposal to provide full-time salaried medical service to the United States as socialized medicine.

The House adopted a resolution reaffirming its previous stand that Negroes be admitted to medical societies where discrimination had been practiced. Progress was noted in this respect in the resolution.

The House approved a resolution supporting the Reed-Keogh bills which provide for establishment of retirement plans for the self-employed.

The House recommended that the Board of Trustees restudy the method and amount of compensation paid to state societies for the collection of AMA dues after consultation and conference with the organization of secretaries and officers of state societies.

The House adopted a resolution disapproving of the policy of veterans hospitals of accepting non-service-connected disability cases.

The House adopted a resolution changing the By-Laws to include the Section Delegate in the Executive Committee of the Section.

The House adopted a resolution requiring payment of expenses of Section Delegates in representing the Section at the House of Delegates meetings twice annually.

The House adopted a resolution approving transfer of seriously disabled veterans from service hospitals to Veterans Administration facilities.

The House referred to the Board of Trustees a recommendation for reactivation of the Committee on Motor Vehicle Accidents.

The House recommended adoption of the resolution stating that the American Medical Association does not support any political party or any candidate for elective public office.

The House approved resolutions amending the By-Laws to change the date of deciding on the apportionment of delegates from state associations from December 1 to December 31 of each year, and a provision allowing a duly elected delegate or alternate to finish his unexpired term even though that state's delegation apportionment has been reduced.

The House approved a resolution requiring a restudy by the Council on Medical Education and Hospitals of the policy of establishing residencies and internships toward correcting the imbalance between the large number of established internships and residencies and the small number of physicians available to fill them.

The House adopted a resolution recommending that the Veterans Administration be required to furnish a form or signed statement for eligibility to pay for services rendered by the VA.

The House adopted a resolution recommending an amendment to the Constitution of the United States which would limit the taxing power of the federal government.

The House then heard a few brief remarks from Dr. Ernest E. Claxton, Assistant Secretary of the British Medical Association. Dr. Claxton stated, "I believe that medicine's role and destiny in this atomic age is to give the nations of the world the answer, the secret of living together, that medicine can be an inspiring, uniting and cleansing force in the nations, and that we move from treating sick people to treating a sick world."

Dr. John M. Galbraith, President of the Nassau County, New York, Medical Society, presented Dr. Louis H. Bauer with a gavel.

The House heard the supplementary report of the Board of Trustees presented by Dr. Dwight H. Murray, Chairman. Approval was given to opposition to any regulation which would allow intern service to count against total military and reserve obligation; and approved a posthumous Citation for Distinguished Service to Mr. Howard W. Blakeslee, science editor for the Associated Press.

The House heard a telegram from Mr. Millard Caldwell, Federal Civil Defense Administrator, commending the American Medical Association for the development of its excellent and far-reaching program of civil defense medical preparedness.

Dr. Elmer L. Henderson, president of the American Medical Education Foundation, received for the Foundation a $10,000 check from the Woman's Auxiliary to the American Medical Association.

The House adopted a resolution officially expressing commendation and heartfelt thanks to Dr. Cline for his devotion to the ideals of the profession and his real contributions toward its advancement.

The House adopted a resolution urging the Advisory Board of Medical Specialties to take action so that participation in emergency medical service should not prejudice the standing of a physician with a specialty board.

Dr. Gunnar Gundersen, Chairman of the Joint Commission on Accreditation of Hospitals, presented Dr. Edwin L. Crosby, Baltimore, newly chosen director of that commission.

The House unanimously adopted a resolution condemning the passage of H. R. 7800 as a breach of faith by the administration with those who would benefit from this bill in a flagrant attempt to railroad through a provision to aid in the socialization of medicine which could not possibly be adopted if considered openly and fairly.

Election of officers followed:

President-Elect—Edward J. McCormick, M.D., Toledo, Ohio
Vice President—Leo F. Schiff, M.D., Plattsburg, New York
Secretary—George F. Lull, M.D., Chicago
Treasurer—J. J. Moore, M.D., Chicago
Speaker, House of Delegates—James R. Reuling, M.D., Bayside, New York
Vice Speaker, House of Delegates—E. Vincent Askey, M.D., Los Angeles, California

The House elected Drs. Dwight H. Murray, Napa, California, and James R. McVay, Kansas City, Missouri, as members of the Board of Trustees.

Dr. Homer L. Pearson, Jr., Miami, Florida, was elected as a member of the Judicial Council.

Dr. Stanley P. Reimann, Philadelphia, Pennsylvania, was elected as a member of the Council on Scientific Assembly.

The House elected the following members of the Council on Medical Education and Hospitals: Dr. Herman G. Weiskotten, Skaneateles, New York; Dr. John W. Cline, San Francisco, California; Dr. James M. Faulkner, Boston, Massachusetts; Dr. Charles T. Stone, Sr., Galveston, Texas; Dr. Leland S. McKittrick, Boston, Massachusetts.

Elected to the Council on Medical Service were: Dr. Elmer L. Hess, Erie, Pennsylvania; Dr. Carlton E. Wertz, Buffalo, New York; Dr. James Q. Graves, Monroe, Louisiana.

Dr. James Stevenson, Tulsa, Oklahoma, was elected a member of the Council on Constitution and By-Laws.

The House voted to accept the invitation to hold the Annual Session in Atlantic City, N. J., in 1955.

The following were elected as Affiliate members: Dr. Theodore F. Braun, Columbus, Ohio; Dr. John A. Cremer, Dembi Dollo, Ethiopia; Dr. Burton C. Dyson, Hamadan, Iran; Dr. Ivanoel Gibbins, Ambala City, Punjab, India; Dr. Paul Stayer Hoover, Bulsar, Surat District, India; Dr. John F. Sheldon, Salisbury, Southern Rhodesia, Africa; Frederick Gudernatsch, Ph.D., Sc.D., New York.

Dr. Edward J. McCormick, newly elected president-elect, then addressed the House, and pledged to do everything in his power for American medicine and for the preservation of the democracy which has made this country the greatest country in the history of the world.

Dr. F. F. Borzell, retiring Speaker of the House, expressed his extreme appreciation for the courtesies that had been shown to him. The House gave Dr. Borzell a rising vote of thanks.

After extending thanks and cordial greetings to the Chicago Medical Society and the Illinois State Medical Society for the hospitality and fine treatment received at the meeting, the House of Delegates adjourned at approximately 4:40 p.m., June 12, 1952.

Vein-Sparing

Parenteral Alimentation Facilitated with ALIDASE

For either rapid or slow administration of fluids, the use of ALIDASE®—highly purified hyaluronidase—places hypodermoclysis on a practical basis. When Alidase is added to the first few cubic centimeters of fluid, absorption from subcutaneous tissue is greatly facilitated. Injection is thus permitted at a convenient site with little or no swelling or discomfort, without arm boards and without many of the difficulties encountered with intravenous injection.

RESEARCH IN THE SERVICE OF MEDICINE

In Memoriam

DAVID DERRICK ANDERSON

Dr. David D. Anderson, a native of Minneapolis, and since his graduation from the University of Minnesota Medical School in 1920, a practitioner there, died July 31, 1952 at the age of sixty-two.

Dr. Anderson was born September 19, 1889. He interned following his graduation at the City and County Hospital in Saint Paul and in the Swedish Hospital in Minneapolis. Staff memberships were held in Swedish and Mount Sinai Hospitals. In 1936, he made a trip to Vienna for postgraduate work.

He was a member of the Hennepin County Medical Society, the Minnesota State Medical Association and the American Medical Association and of the American Academy of General Practice. He served on the board of deacons of the First Evangelical Free Church in Minneapolis for more than twenty years.

Dr. Anderson is survived by his wife, Signe, a son, David, and a daughter, Patricia. His father, Albert J. Anderson, two brothers and two sisters also are living.

MELVIN W. BINGER

Dr. Melvin W. Binger, a member of the Mayo Clinic staff from 1930 to 1946, died at his home in Chattanooga, Tennessee, on July 26, 1952.

Dr. Binger was born October 27, 1896 at Crete, Nebraska, and received a B.A. degree *cum laude* from Doane College in Crete in 1921. Degrees of B.S., M.A., and M.D. were obtained from the University of Nebraska in 1923, 1924 and 1926, respectively. Dr. Binger came to the Mayo Foundation in 1926 and was appointed to the staff of the Mayo Clinic in 1930. He had become an associate professor of medicine in the Mayo Foundation when he left for Chattanooga in 1946.

Dr. Binger had been certified as a specialist in internal medicine by the American Board in 1937. He was a member of the Central Society for Clinical Research, Sigma Xi and of the Tennessee State Medical Association and the American Medical Association.

Dr. Binger married Joy A. Hoffhine in 1927. They were divorced. Three sons: William, Richard, and Charles, and one daughter, Patricia, all of Rochester, survive him.

ARCHIBALD HILDRETH BEARD

Dr. Archibald H. Beard, a well-known internist of Minneapolis and best known for his interest in diabetes, died August 14, 1952. He was sixty-two years of age having been born in Pueblo, Colorado, May 13, 1890.

He received the degree of B.A. from the University of Kansas in 1910 and an M.D. degree from Harvard Medical School four years later. He interned at the Boston City Hospital in 1914-15, the Massachusetts General Hospital in Boston from March, 1915 to August, 1916. He was a resident at the University Hospital of Minneapolis from August, 1916, until September, 1917. He was a full-time instructor in Medicine at the University of Minnesota from 1916 to September, 1917, and was on the staff of Base Hospital 26 from 1917 to 1919. Postgraduate work was taken in tuberculosis at the Trudeau Sanatorium at Saranac Lake, New York, in 1925-26 and further postgraduate study for six months in Europe in 1928-29.

Dr. Beard was a member of the Hennepin County Medical Society, the Minnesota State Medical Association and the American Medical Association. He was also a member of the American College of Physicians and had served as chairman of the Committee on Health and Medical Care of the Minneapolis Community Chest. He was an elder at Westminster Presbyterian Church, a member of the Minneapolis Athletic Club, Masons and Scottish Rites. He also belonged to Sigma Alpha Epsilon, Nu Sigma Nu and Sigma Xi fraternities.

Dr. Beard married Amelia Hartman, who with a son, Archibald, and a daughter, Mary, survives him.

DAVID KNOX CALDWELL

Dr. David Knox Caldwell of Saint Paul died August 12, 1952, at the age of seventy-four.

Dr. Caldwell was born in Berlin, Illinois, March 30, 1878. He graduated from Hamline University in 1899 and taught school for two years before returning to Hamline University to study medicine. He had practiced in Saint Paul since 1907.

Dr. Caldwell is survived by his wife and two daughters: Mrs. T. J. Quick of the Island of Guam and Mrs. James Vaughn of Los Angeles.

EVERETT C. GAINES

Dr. E. C. Gaines, a beloved and respected resident of Buffalo Lake, Minnesota, tragically lost his life in an automobile accident August 15, 1952. He was seventy-nine years old and had practiced more than fifty years at Buffalo Lake.

Dr. Gaines was born in Minneapolis, January 31, 1874. He attended public schools in Minneapolis and received his medical degree from the University of Minnesota in 1899. While at the University, he won some distinction as an athlete on the track team. He took postgraduate work at the University of Chicago in 1912.

Dr. Gaines was an outstanding example of a general practitioner beloved by his community. In 1950, on the occasion of his having practiced in Buffalo Lake for fifty years, he was tendered a banquet by seventy-five of his friends and in the evening he and Mrs. Gaines were honored by a get-together in the High School of some 1,000 acquaintances. The celebration was attended by some of his former associates including Dr. Stephen Baxter of Minneapolis and Dr. Walter Sahr of Hutchinson. The gathering was addressed by Dr. Ernest M.

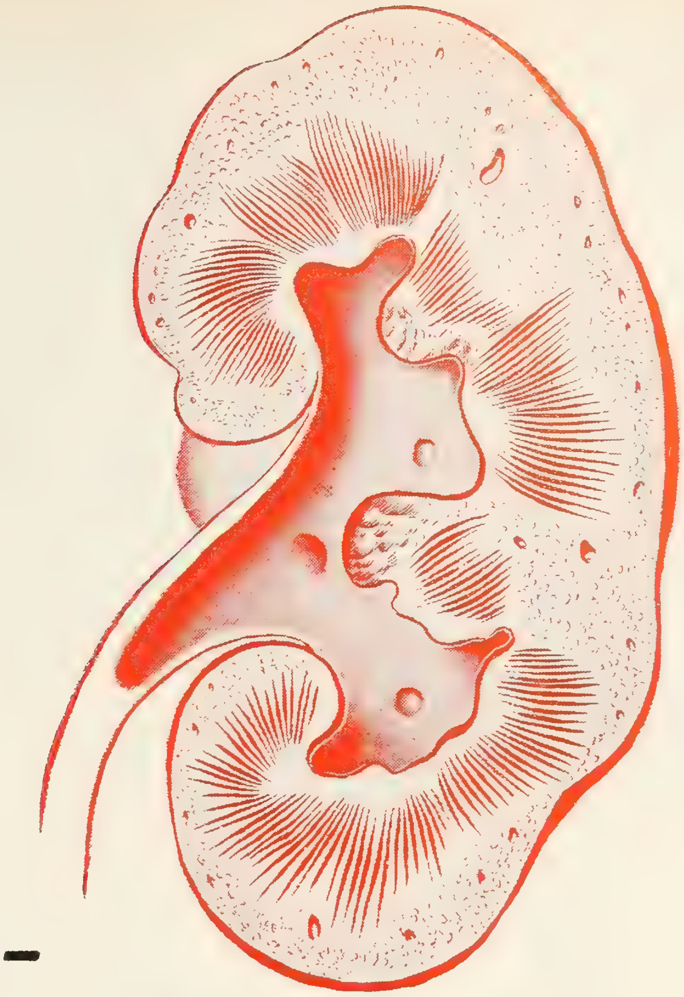
attain the goal in acute urinary tract infections– ***quickly...***



The immediate goal in pyuria, regardless of etiology, is to render the urine sterile. SULAMYD,® (sulfacetamide—Schering) is a highly soluble sulfonamide, rapidly cleared from the blood stream and highly bacteriostatic for most common urinary tract pathogens. SULAMYD quickly controls infections with negligible risk of renal complications because of its ready solubility in urine.

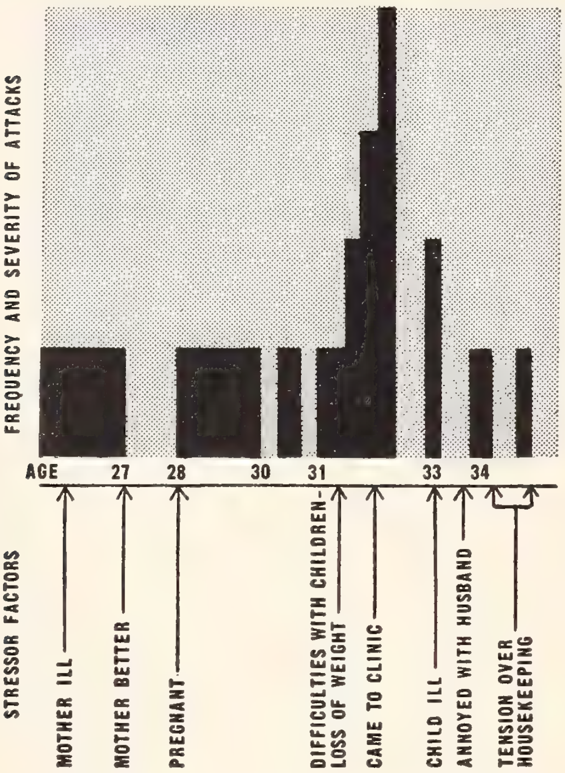
Stress . . .

Stressor factors which evoke autonomic responses occur often in our civilization. They are not always of external origin, frequently, stress springs from the "well of uncertainties, the fears, the angers, and the hostilities that an inadequate childhood nurtures in troubled people in a troubled world."[1]



After: Relationship Between Life Stress And Symptoms — Stevenson, I.: G.P. *4*: 67 (Dec.) 1951

When emotions aroused by these stresses are not dissipated in appropriate biological behavior, heightened autonomic impulses beat against a "moored" physique.[1]

Incessant "emotional buffeting" impinged on labile autonomic pathways is likely to produce deviations from normal body function and *a rash of symptoms.* In such cases, both branches of the autonomic nervous system are involved. For symptomatic relief oral administration of cholinergic and adrenergic blocking agents and central sedation has proven successful. Drugs effective for the several actions respectively are: belladonna alkaloids, ergotamine tartrate and phenobarbital. These drugs may be used individually or in combination,* as required by the individual case, to effect more stable function of the autonomic nervous system, thereby "dampening" overactivity of the involved organ systems.

* Dosage of each ingredient adjusted to the needs of the particular patient.

(Continued from Page 882)

Hammes of Saint Paul, and Dr. Gaines was presented with a gold watch by the Renville County Medical Society of which he was a former president. He also received a medal from the Minnesota State Medical Association for fifty years of service.

Dr. Gaines is survived by his wife, Adele Foster, a son William, of Buffalo Lake, and a daughter, Mrs. R. O. Boehlke.

NORMAN C. OCHSENHIRT

Dr. Norman C. Ochsenhirt, formerly a fellow in surgery at the Mayo Foundation, died in Pittsburgh on July 24, 1952, of coronary occlusion.

Dr. Ochsenhirt was born in Pittsburgh, February 12, 1892. He received his M.D. degree from the University of Pittsburgh in 1917. He served in the Medical Corps of the Army for a year during World War I and was in the U. S. Public Health Service for two years before entering the Mayo Foundation in 1924. He received the degree of M.S. in Surgery in 1927 from the University of Minnesota. After a brief stay in Cleveland, he moved to Pittsburgh.

He was assistant professor of oral surgery at the University of Pittsburgh School of Dentistry in addition to being on the surgical staff of several Pittsburgh hospitals. He was a fellow of the American College of Surgeons, the International Society of Dental Research, and the Pittsburgh Surgical Society.

CLIFFORD T. WADD

Dr. Clifford T. Wadd, for the past twelve years a practitioner at Janesville, Minnesota, died suddenly when his car left the road on July 21, 1952.

Dr. Wadd was born in Waseca, October 20, 1911. He obtained his M.D. degree from the University of Minnesota in 1937 and interned the following fifteen months at Minneapolis General Hospital.

In 1938 he became associated with Dr. O. J. Swenson of Waseca, Minnesota, and practiced there until he purchased the practice of Dr. C. R. Chadbourne in Janesville.

Dr. Wadd was active in community affairs and was respected by all who knew him. He was at one time president of the School board, was the Senior Warden of Janesville Lodge No. 124 A.F. and A.M., a member of the Waseca chapter of Regal Arch Masons, the Janesville Lodge I.O.O.F., the Mankato Lodge B.P.O.E. and the Janesville Methodist Church. He was also a member of the Waseca County Medical Society, the Minnesota State Medical Association and the American Medical Association.

Dr. Wadd married Reba Staley, who with three daughters and a son survives him. He is also survived by his parents, Mr. and Mrs. Alfred Wadd of Waseca.

The fatal accident was the more tragic in that it took a valuable citizen of Janesville in his prime.

◆ Reports and Announcements ◆

UROLOGY AWARD

The American Urological Association offers an annual award of $1,000.00 (first prize of $500.00, second prize $300.00 and third prize $200.00) for essays on the result of some clinical or laboratory research in Urology. Competition shall be limited to urologists who have been in such specific practice for not more than five years and to men in training to become urologists.

The first prize essay will appear on the program of the forthcoming meeting of the American Urological Association, to be held at the Hotel Jefferson, St. Louis, Missouri, May 11-14, 1953.

For full particulars, write the Executive Secretary, William P. Didusch, 1120 North Charles Street, Baltimore, Maryland. Essays must be in his hands before January 15, 1953.

FELLOWSHIPS FOR BASIC RESEARCH IN ARTHRITIS

The Arthritis and Rheumatism Foundation is offering to qualified individuals research fellowship in the basic sciences related to arthritis.

Followships w'll be granted on both the predoctoral and postdoctoral levels, and will run for one year with prospect of renewal.

The predoctoral fellowships will range from $1,500 to $3,000 per annum depending on the family responsibilities of the fellow, and the postdoctoral fellowships will range from $3,000 to $6,000 on the same basis.

The deadline for applications is November 1, 1952. Applications will be reviewed and awards made by February 15, 1953.

For information and application forms, address the Medical Director, the Arthritis and Rheumatism Foundation, 23 West 45th Street, New York 36, N. Y.

NATIONAL GASTROENTEROLOGICAL ASSOCIATION

The seventeenth annual convention and scientific sessions of the National Gastroenterological Association will be held at the Hotel Statler in New York City, October 20, 21, 22, 1952.

Included in the program will be a Symposium on Liver Diseases, a Symposium for the General Practitioner and a Symposium on Bleeding Esophageal Varices and the Problems of Portal Hypertension. Another interesting panel discussion will be on Gastrointestinal X-Ray Methods, Diagnosis and Treatments.

Immediately following the convention, the Association will conduct its Fourth Annual Course in Postgraduate Gastroenterology at the Hotel Statler in New York City. The course will again be under the personal direction of Dr. O. H. Wangensteen of Minneapolis and Dr. I. Snapper of New York.

Further information may be obtained by writing the Secretary, National Gastroenterological Association, 1819 Broadway, New York 23, N. Y.

OMAHA MID-WEST CLINICAL SOCIETY

The Omaha Mid-West Clinical Society will hold its twentieth annual Clinical Assembly at Hotel Paxton, Omaha, Nebraska, October 27-31, 1952. An outstanding program is assured and will include a panel discussion on chronic diseases by guest speakers on Friday, October 31.

This assembly has been approved by the American Academy of General Practice, and members will be credited with the actual number of hours of attendance at the sessions.

Further information may be obtained by writing to the executive office of the Society at 1031 Medical Arts Building, Omaha, Nebraska.

COURSES IN ASPHYXIAL TREATMENT

The New York Eye and Ear Infirmary, in cooperation with the Society for the Prevention of Asphyxial Death, Inc., announces the resumption of its New York City courses in Laryngoscopy and Intubation (Flagging) for the prevention and treatment of acute asphyxial accidents. These courses are given at the New York Academy of Sciences, 2 East 63rd Street, the first Friday and Saturday of each month. The September class will meet Friday afternoon and Saturday morning, September 5 and 6, 1952. Matriculation fee, fifty dollars.

A course will also be presented in San Francisco, September 19 and 20, 1952. The purpose of the course is to emphasize asphyxia as a major medical problem and to acquaint the General Practitioner, Pediatrician, Obstetrician and other groups with the death zone of the respiratory tract. This information is presently saving lives, in the hospital, in the office and in outside practice.

While this course is given regularly, in the fall, winter, and spring in New York City, out-of-town courses have met in Columbus, Ohio; Boston, Massachusetts; Washington, D. C.; Los Angeles, California; Honolulu, T. H.; Chicago, Illinois; Atlantic City, New Jersey; and in Baltimore, Maryland. Out-of-town courses require a period of two months for logistical development. Those interested in attending one of the monthly courses in New York City or in having a course presented in their home city, should communicate with Secretary, S.P.A.D., 2 East 63rd Street, New York City 21, New York.

MINNESOTA MEDICAL ALUMNI MEETING

The annual meeting of the Minnesota Medical Alumni Association will be held at the University Hospital on Saturday, November 1, 1952 at 11:30 A.M. The meeting will be held on the morning of the Homecoming football game between Minnesota and Iowa.

On the same occasion, Minnesota Medical Alumni as well as other physicians will be able to take part in other medical activities which will include a meeting

of the American Academy of General Practice at the Radisson Hotel, Minneapolis, on Wednesday, October 29; a Continuation Course in Medical Economics at the Center for Continuation Study and Museum of Natural History Auditorium on Thursday, October 30 and Friday morning, October 31 (tuition charge $15.00); Hospital Staff meeting Friday noon, October 31; Homecoming clinics Friday afternoon and Saturday morning, October 31 and November 1. The Medical Economics will deal with tax problems, investments, bookkeeping methods, office planning, et cetera, as applied to physicians.

MINNESOTA ACADEMY OF GENERAL PRACTICE

The Minnesota Academy of General Practice will hold its annual Fall Refresher at the Hotel Radisson in Minneapolis on Wednesday, October 29, 1952, starting at 8:20 A.M. This is an intensive one-day course on a variety of subjects. A distinguished list of speakers will include Drs. Philip Thorek and Philip Lewin of Chicago, Dr. A. C. Corcoran of Cleveland, Dr. J. E. Estes of the Mayo Clinic, Drs. E. T. Bell and Cecil J. Watson of the University of Minnesota.

MINNESOTA SOCIETY OF NEUROLOGY AND PSYCHIATRY

The regular meeting of the Minnesota Society of Neurology and Psychiatry was held at the Town and Country club in Saint Paul on September 9.

The following scientific papers were presented: "An Unusual Anomaly of the Spinal Cord," by Dr. Joseph A. Resch and "Pathology Found in Autopsies Performed on State Hospital Cases," by Dr. Jorge A. Lazarte.

The social hour began at 5:30 p.m. and dinner was served at 6:45 p.m.

CONTINUATION COURSES

The University of Minnesota will present a continuation course in *Fractures and the Surgery of Trauma* on November 13, 14 and 15, 1952. This program is intended primarily for physicians engaged in general practice and will include a discussion of the evaluation of injuries from the medico-legal standpoint. Two outstanding guest faculty members will participate: Dr. Carroll B. Larson, Chief of Service, Department of Orthopedic Surgery, State University of Iowa, Iowa City; and Dr. Edward L. Compere, Professor of Bone and Joint Surgery, Northwestern University Medical School, Chicago. The remainder of the faculty will include members of the clinical and full-time staff of the University of Minnesota Medical School.

* * *

A continuation course in *Medical Economics for Physicians* will be presented by the University of Minnesota next October 30 and 31. The course will be held in the Auditorium of the Museum of Natural History, which is adjacent to the Center for Continuation Study. During the one and a half-day session many topics of great interest to all physicians will be discussed by recognized authorities. A partial list of subjects to be

AT YOUR CONVENIENCE, DOCTOR . . .

you are cordially invited to visit our new and modern prescription pharmacy located on the street floor of the Foshay Tower, 100 South Ninth Street.

With our expanded facilities we will be able to increase and extend the service we have been privileged to perform for the medical profession over the past years.

presented includes the business aspects of medical practice, the doctor and the law, investments, and office planning.

At noon on Friday, October 31, following the conclusion of the course, a Homecoming Program for Physicians will get under way with the presentation of a special program at the staff meeting of the University Hospitals. On this occasion one of Minnesota's best-known and widely respected practitioners will discuss the role of the Medical School in relation to medical practice in the state. On Friday afternoon and Saturday morning, Homecoming Clinics will be held at the University Hospitals. These clinics, so popular prior to World War II, will be expanded and will include the presentation of interesting and instructive surgical, medical, pediatric, dermatological, and gynecological cases. All physicians are cordially invited to attend this Homecoming Program.

* * *

The University of Minnesota will present a continuation course in *Endocrinology* at the Center for Continuation Study on December 4 to 6. This course is intended primarily for physicians engaged in general practice and will include discussions of recent advances in the clinical use of ACTH and cortisone, the treatment of diabetes mellitus, and other common endocrine disorders. Dr. Dwight J. Ingle, Pharmacology Research, The Upjohn Company Kalamazoo, Michigan, will be the guest faculty member for the course. Dr. Ingle will also present the annual Journal-Lancet Lecture on December 4.

The course will be presented under the direction of Dr. C. J. Watson, Professor and Director, Department of Medicine, and the remainder of the faculty will include members of the full-time and clinical staff of the University of Minnesota Medical School and the Mayo Foundation.

In the United States about 3,000,000 persons are ill at any one time and more than 22 per cent of the yearly deaths are due to germ invasions. Nobody knows just how many persons have colds, influenza and sore throats each year, but estimates of common colds alone run as high as 85 per cent of the population.—*Christmas Seal Health News.*

Free tuberculin is again available to Saint Paul physicians at some eighteen drug stores in the city. This service is supplied by the Ramsey County Tuberculosis and Health Association which is supported by Christmas Seal funds.

* * *

Dr. Franklin A. Neva, Cloquet, was awarded a one-year post doctoral fellowship in virology. The fellowship is sponsored by the National Foundation of Infantile Paralysis and Dr. Neva will conduct his study at Children's Hospital, Boston, Massachusetts.

* * *

Dr. Byron E. Hall, a consulting physician at the Mayo Clinic and an associate professor of medicine in the Mayo Foundation, left Rochester July 1 to begin private practice in San Francisco.

* * *

Dr. Herman Joseph Just, formerly of Lafayette, was married August 2 to Mrs. Rose Mary Modlin, Saint Paul, at Hastings where he is now practicing. **Dr. Worth A. Hooper**, Blue Earth, recently joined Dr. Just in his practice at Hastings.

* * *

Dr. Harry C. Browne, recently staff physician with the Veterans hospital in Spokane, Washington, joined the Bratrud clinic, Thief River Falls, in August. Dr. Browne was graduated from the University of Oregon medical school. He was a resident in internal medicine at the Mayo Clinic Foundation from 1936 to 1939; a consultant and associate professor at the University of Minnesota, 1939 to 1947, and served two years with the Mayo Clinic hospital unit in the Pacific during World War II. Dr. Browne will specialize in allergies and diseases of the heart.

* * *

Dr. J. Gordon Beaton, member of the Fritsche clinic in New Ulm since 1951, left his practice there September 1. As yet Dr. Beaton has not decided where he will locate.

* * *

Dr. F. J. Hill, Minneapolis health commissioner, will attend the annual meeting of the American Public Health Association in Cleveland, October 20.

* * *

Dr. A. B. Nietfield, Warren, began practice in Sauk Centre in August. Dr. Nietfield has been a member of the Warren Hospital staff for six years. He was graduated from the University of Minnesota medical school in 1939 and served four years with the army in the American and Asiatic-Pacific theaters during World War II.

* * *

Dr. M. J. Lester, temporarily closed his practice in Truman on August 1, to serve with the United States Navy.

The "personality" sketch in *Time* magazine (week of July 19) featured **Dr. Benjamin Spock,** formerly of the Mayo Clinic and the Rochester Child Health Institute. Dr. Spock is now professor of child development at the University of Pittsburgh.

* * *

To commemorate his forty years of service to Park Rapids, **Dr. Walter W. Higgs** was honored July 31 at a dinner sponsored by the Ladies Auxiliary of the Veterans of Foreign Wars. **Dr. A. V. Garlock, Bemidji,** a classmate of Dr. Higgs at Northwestern University, gave the main speech.

* * *

Dr. Gregory Schissel, Ancker Hospital, Saint Paul, began practice in Crystal in July. Dr. Schissel is the first physician Crystal has had. His office is in the new Pharmacy building.

* * *

Dr. Herman J. Moersch, of the Mayo Clinic staff, left the United States in early August for several months' speaking tour. Dr. Moersch plans to present papers at medical meetings at Rio de Janeiro, Buenos Aires, Montevideo, Cordoba and Santiago. Dr. and Mrs. Moersch expect to visit Trinidad, Brazil, Argentina, Urugay, Chile, Peru, Panama and Mexico during their stay.

* * *

Dr. Russell Baker left his Hayfield practice in July to study x-ray diagnosis at the University of Wisconsin.

* * *

The Osseo Clinic will be moved into a new building as soon as the remodeling job, started in late July, on the Westinghouse store is finished. **Dr. John Pone** joined **Drs. Traugott J. Bloedel** and **Robert H. Ransom** on the Clinic staff, August 1.

* * *

Obstetrics and Gynecology, a new monthly journal being sponsored by the American Academy of Obstetrics and Gynecology, will make its appearance in January, 1953. The journal will be the official organ of the Academy and will provide an outlet for the publication of new developments and research in obstetrics, gynecology and allied fields.

* * *

Dr. Flower day was held in Gibbon on July 27, honoring ninety-one-year-old **Dr. W. Z. Flower** for his long years of medical service to the community.

* * *

The Silver Star medal and an Oak Leaf cluster were awarded to **Dr. Gilbert S. Campbell,** Minneapolis, for gallantry during his army duty in Korea in 1951.

* * *

Dr. William W. Winchester, staff, Mayo Clinic, left in July to begin private practice in San Jose, California.

Dr. H. J. Burns, Duluth, was appointed city civil service physician on August 4.

* * *

A physicians exchange service was begun in Owatonna in July. The co-operating physicians are **Drs. F. C. Anderson, John F. Arnesen, Donald H. Dewey, Daniel K. Halvorsen, Curt W. Lundquist, C. T. McEnaney, John A. McIntyre, Albert J. Olson, Oliver W. Roberts, Theodore W. Stransky** and **R. J. Wilkowske.**

* * *

Dr. Herb L. Huffington, San Jose, California, joined **Drs. George S. Bergh, Carter W. Howell** and **Solveig M. Bergh,** in their offices and practice in Montevideo, in August.

Dr. Paul T. Lowry, Minneapolis, received a one-year extension of his post-doctoral fellowship in internal medicine. The fellowship is sponsored by the National Foundation for Infantile Paralysis. Dr. Lowry is carrying on his study and investigation at the University of Minnesota.

* * *

Dr. Carl Weiss, Lawrence, Massachusetts, opened an office in the Radabaugh building in Hastings in August.

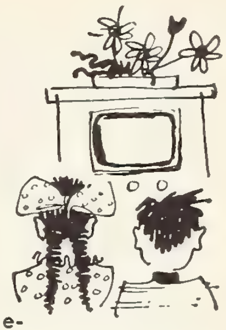
HOSPITAL NEWS

The new $1,707 000 unit at **St. John's Hospital** Saint Paul, which will add approximately eighty new beds to the hospital capacity will be completed about October 15, 1952. On that date it is contemplated all operations of the hospital will be concentrated in the new addition, and remodeling of the old building will begin.

On the first floor of the new addition there will be the new operating room and new administrative office space. The new obstetric division and nursery will be on the second floor. The third and fourth floors will be given over to general patients' rooms exclusively, while the top floor will house the chronic disease section.

Members of the building committee in addition to

"kid stuff"



Today's young "sprouts" are demanding more and more of their eyes. Audio visual aids, school work, daily routine, and entertainment media team up to bring constant strain to their priceless vision. It's all a part of every carefree day.

But *guarding the future* of these young eyes cannot be considered "Kid Stuff." For almost 40 years Benson's have worked with better eye doctors transforming the prescriptions of their youthful patients into glasses that will assure better vision throughout the lifetime ahead.

Open house was held August 16 to initiate the newly erected clinic building at Hancock. It is a one-story structure with full basement in which there are veterinary offices. Part of the ground floor is occupied by dental offices. **Dr. O. A. Eide** has his offices in the rest of the building. There is a reception room, office, laboratory, x-ray room and two treatment rooms. One treatment room is papered and decorated especially to appeal to children.

* * *

A $30,000 check for heart disease research was presented to the University of Minnesota, August 22, by the Minnesota Heart Association. The check was given to **Dr. Harold S. Diehl,** dean of medical sciences. The remainder of a $50,000 grant for the year 1952-53 will be turned over later.

* * *

BLUE CROSS-BLUE SHIELD NEWS

In the statistical data covering the first six months of 1952, just compiled by Minnesota Blue Shield, are to be found a number of facts of interest to physicians. Among the salient features revealed by this analysis are total Blue Shield benefits paid, the increased number of claims per year per 1000 contracts, the increased cost per year per contract, and the decreasing percentage of subscribers classified as unlimited under the present annual income levels. Though many other highly significant facts are apparent in this report, these especially are worthy of more detailed consideration.

Payments of Blue Shield claims during the first six months of 1952 total $1,857,080. On this basis total Blue Shield payments to doctors during the whole year of 1952 will amount to $3,745,000 or about four million dollars. This is particularly interesting when related to payments of two million dollars in claims in 1950, three million in 1951 and a total payment of ten million dollars in claims by the end of this year or during the first five years of Minnesota Blue Shield's existence.

That subscribers are using their contracts and filing more claims is evident from the fact that the number of claims per year per 1000 contracts increased from 384 in 1950 and 499 in 1951 to 515 during the first six months of 1952. This represents a 34 per cent increase in contract utilization during a three-year period.

Immediately upon realizing that more claims are filed under each contract per year, the question arises what influence has this upon the cost per year per contract. In this respect it is found that the cost per year per contract increased from $15.36 in 1950 and $17.85 in 1951 to $18.14 during the first six months of 1952. Percentagewise this increase is less than the increase in the number of claims per year per 1000 contracts just discussed yet it is actually an 18 per cent increase or about an increase of one-fifth in just three years.

Unlimited subscribers are those single persons with

MINNESOTA REPRESENTATIVE—S. E. STRUBLE, WYOMING, MINN.

annual incomes of $2000 or less or family subscribers with total gross family incomes of $3000 or less. For such subscribers participating physicians have agreed to accept the Blue Shield payments as payment in full for the services rendered. Analysis has been made of both the percentage of claims and percentage of cost, but since the different percentages so closely approximate one another, only the percentage of claims will be discussed. The report shows that in 1950, 30.6 per cent of the claims were for unlimited subscribers, whereas this ratio had decreased to 23.7 per cent in 1951 and only 14.4 per cent in 1952. In other words, there is a steadily decreasing percentage of subscribers whose Blue Shield claim payments must be accepted as payment in full for the services rendered.

This matter has been subjected to critical study in relation to incomes now found in various segments of Minnesota population. In other words the annual income levels of $2000 for single persons and $3000 for families covered nearly 70 per cent of the population of Minnesota in 1949, whereas now these same income levels include only 43 per cent of the state's population. This raises the question about the accuracy of the data secured from incompletely answered Medical Service Reports. This whole matter is stimulating a more detailed study.

During the first six months of 1952, hospital benefits in the amount of $6,960,468.00 were provided to Minnesota Blue Cross subscribers. This amount represented an increase of 10.3 per cent compared to $6,312,944.00 provided during the same period of 1951 and 24.2 per cent compared to $5,606,483.00 provided during the same period of 1950. On the basis of the past two years, it is estimated that hospital benefits provided during the year 1952 will be approximately $14,000,000.00 bringing the total benefits provided subscribers since 1933 to approximately $78,000,000.00.

Non-Group Enrollment

Commencing September 9, Blue Cross-Blue Shield non-group enrollment will be open to all residents of Minnesota in good health under sixty-five years of age who are anxious to receive this valuable Blue Cross-Blue Shield protection.

All doctor's offices will be provided with literature, posters, and application cards, and doctors are urged to help their patients in Blue Cross-Blue Shield enrollment—one of the finest types of hospital-medical-surgical coverage ever offered to the people of Minnesota.

The non-group campaign will run from September 9 to November 1, 1952, with all applications received prior to October 1 to become effective November 1 and applications received prior to November 1 to become effective December 1, 1952.

An entirely new type of Blue Cross non-group coverage will be offered—the new $25 deductible semi-private room contract, offering more liberal benefits.

Complete details concerning this new type plan have already been mailed and no doubt are already in the hands of every Minnesota doctor and hospital.

This new departure in health care contracts is frankly experimental, and designed not only to render utmost service to non-group subscribers but also to combat the threat of socialized medicine. It should be emphasized that its success will be largely dependent on the amount of support given this new deductible type contract by the doctors and hospitals of Minnesota.

In addition, the Blue Shield non-group contract will include a substantially increased schedule of surgical benefits, with thirty days of in-hospital care provided for each separate illness. These and other increased Blue Shield benefits will become available to subscribers at no increase in rates.

BOOK REVIEWS

Books listed here become the property of the Ramsey, Hennepin and St. Louis County Medical Libraries when reviewed. Members, however, are urged to write reviews of any or every recent book which may be of interest to physicians.

SEX AFTER FORTY. S. A. Lewin, M.D., and John Gilmore, Ph.D. Introduction by The Reverend Dr. Russell L. Dicks, Professor of Pastoral Care, Duke University. 200 pages. Illus. Price $3.50 cloth. New York: Medical Research Press, 1952.

METABOLIC METHODS; CLINICAL PROCEDURES IN THE STUDY OF METABOLIC FUNCTIONS. By C. Frank Consolazio, Chief of Biochemistry, United States Army, Medical Nutrition Laboratory, Chicago, Illinois; Robert E. Johnson, M.D., D. Phil. (Oxford), Professor and Head of the Department of Physiology, University of Illinois, Urbana, Illinois; and Evelyn Marek, M.A., Biochemist, United States Army, Medical Nutrition Laboratory, Chicago, Illinois. 471 pages. Illus. Cost $6.75. St. Louis: C. V. Mosby Co., 1951.

Metabolic Methods by Consolazio, Johnson and Marek represents a rather complete compilation of the various procedures used in metabolic studies. The book is arranged as a modified outline and in this way presents the material concisely and uniformly so that one can readily obtain the information he seeks. This book is not intended for thorough reading but more as a handy, concise and quite complete reference volume. Bibliographies are appended to almost every section and subsection, and original references are given with the presentation of each procedure. Laboratory procedures are described in detail.

J. F. Alden, M.D.

SURGICAL GYNECOLOGY, INCLUDING IMPORTANT OBSTETRIC OPERATIONS. By J. P. Greenhill, M.D., Professor of Gynecology, Cook County Graduate School of Medicine; Attending Gynecologist, Cook County Hospital; Attending Obstetrician and Gynecologist, Michael Reese Hospital. Illustrated by Angela Bartenbach. (A Handbook of Operative Surgery). 350 pages. Illus. Price, $8.50. Chicago: Year Book Publishers, Inc., 1952.

Surgical Gynecology is a handbook of operative surgery. The book is divided into four sections. The first section is a short but concise discussion of preoperative Preparation and Postoperative Care and Complications, with a very extensive bibliography at the end of the section.

The remaining three sections are divided as follows; Vulvar and Perineal Operations, Vaginal Operations, Abdominal Operations. These sections are arranged so that it is possible to read the very short operative directions on the left side of the book and look at the pertinent plate on the right side.

PATTERSON SURGICAL SUPPLY COMPANY
103 East Fifth St., St. Paul 1, Minn.
HOSPITAL AND PHYSICIANS SUPPLIES AND EQUIPMENT
Cedar 1781-82-83

This volume includes almost every operative procedure necessary in gynecological surgery. Some of the operations which have been described are no longer performed in some clinics; however, for such a small book there is considerable readily available useful and practical information.

As a handy reference to refresh one's memory regarding a surgical procedure with a minimum of reading time plus a quick glance at the plates, this book is invaluable to a surgeon.

JOSEPH F. MELANCON, M.D.

QUESTIONS AND ANSWERS ON ANIMAL EXPERIMENTATION

The National Society for Medical Research announces a new publication—"38 Common Questions—38 Authoritative Answers" on the subject of animal experimentation. The book is a compilation of the questions most commonly asked about the use of experimental animals and brief, direct and factual answers to each of them. Included are questions about pain, the meaning of "vivisection," the ethics of animal experimentation, the animals used, sources of supply, and the purposes for which experimental animals are used.

There is also a section on the legal questions concerning the use of pound animals and the legal aspects of "pound legislation."

About the size of a folded train schedule, the booklet will be valuable as a quick reference for speakers, debaters or teachers. It should be of special interest to secondary and college level teachers and to study groups. Doctors and other scientists and leaders of civic clubs will also find it of value.

Copies may be obtained from the National Society for Medical Research, 208 N. Wells Street, Chicago 6, Illinois.

An American mother today has better than 999 chances out of 1,000 to come through childbirth safely—the best record in our history and, on a comparable basis, the best in the world.—*Christmas Seal Health News.*

Looking Toward New Horizons

The day of adventure and experimentation is by no means past. But current accomplishments are often overlooked in the zeal to scan the horizon for something better. It's sage advice that suggests that we take advantage of and nail down the present maximum accomplishments. It is also sage advice that suggests that you turn to your Society's investigated and tested plan of Accident and Sickness Insurance. The horizon holds no greater value.

Income protection should have priority over all other forms of insurance, for you are not able to maintain anything that you own nor reach that Utopia without income. Please call us today.

DIABETES DETECTION?

This year's Diabetes Detection Drive will begin with Diabetes Week, November 16-22.

By joining, or helping to form, a Committee on Diabetes of your Medical Society, you can cooperate in the organized program to find unknown diabetics in your community.

As an individual practitioner, you can take an active—and essential—part in diabetes detection *all year round,* by making a test for urine-sugar routine for each and every patient.

> P.S. It is only too easy for a busy doctor to overlook testing himself and members of his family.

To screen for diabetes, the simplest method is testing for urine-sugar. A test is made of the first specimen voided one to three hours—preferably 90 minutes—after a full meal. Positive findings of glycosuria are checked by blood-sugar determinations.

During the Diabetes Detection Drive, *Clinitest* Reagent Tablets are available to your Medical Society without charge when requested from the American Diabetes Association. For information call or write the Secretary of your Society.

AWARD WINNING BRASSIERES!

ACCEPTED FOR ADVERTISING IN PUBLICATIONS OF THE AMERICAN MEDICAL ASSOCIATION

Cordelia surgical brassieres have won the Blue Ribbon for five consecutive years. Now, Cordelia has won BOTH the GOLD MEDAL and BLUE RIBBON AWARDS at the 1952 California State Fair Fashion Exhibit.

When she asks . . .

HERE ARE THE FACTS!

Most corrective, surgical and maternity brassiere problems have been scientifically solved by the staff of Physiospecialists at Cordelia of Hollywood.

THE GOLD MEDAL WINNER!

Each Cordelia brassiere is planned and made for easy, individual fittings by experts in local stores.

THE BLUE RIBBON WINNER!

Every Cordelia brassiere is a luxury in fashion fabrics — beautifully, youthfully designed. These are the facts judges took into consideration — then awarded *Cordelia the winner!*

BAKER'S MODIFIED MILK

is fortified by SYNTHETIC Vitamins ONLY

The vitamin content of Baker's Modified Milk is fortified by the addition of sufficient pure synthetic vitamins (except vitamin C) to meet the Recommended Daily Allowances of the Food and Nutrition Board of the National Research Council.

Vitamin A is added in the form of vitamin A palmitate and vitamin D in the form of vitamin D_3.

Thus Baker's contains neither fish liver oil nor fish liver oil concentrate. Therefore, Baker's Modified Milk may be safely used in the feeding of those infants thought to be unable to tolerate fish liver oils.

Added thiamine and niacin are provided as thiamine hydrochloride and niacinamide, thereby avoiding the digestive disturbances sometimes associated with the use of wheat germ or yeast extracts. Adequate riboflavin is supplied by the milk itself.

Since Baker's contains no vitamin C, an auxiliary source of vitamin C should be prescribed by the physician.

Baker's is ethically promoted and ethically distributed.

BAKER'S
MODIFIED MILK
Powder form
For the Bottle-fed Baby
THE BAKER LABORATORIES, INC.
BAKER'S
MODIFIED MILK
Liquid form
For the Bottle-fed Baby
THE BAKER LABORATORIES

POWDER AND LIQUID

AVAILABLE IN DRUG STORES

Baker's Modified Milk is made from Grade A Milk, (U. S. Public Health Service Milk Code) which has been modified by replacement of the milk fat with animal and vegetable fats and by the addition of carbohydrates, vitamins and iron.

VITAMIN CONTENT PER QUART OF NORMAL DILUTION:

Vitamin A	2500 U.S.P. Units
Vitamin D	800 U.S.P. Units
Vitamin C	None
Thiamine	0.6 Milligrams
Niacin	5.0 Milligrams
Riboflavin	1.0 Milligrams

Provides vitamins A and D, also thiamine, niacin, riboflavin, calcium and iron above the minimum daily requirements in the amounts of milk customarily taken by infants. A source of vitamin C should be prescribed by the physician.

Salient facts on the new antituberculous drug...

NYDRAZID

Squibb Isoniazid

	what is known	what is not known
Antituberculous effect	Nydrazid has greater potency against the tubercle bacillus than any other known compound, both in vitro and in experimental animals. Clinical results are encouraging. The effect on fever and general status is often dramatic. Roentgenographic improvement occurs often, but is generally slower than in patients treated with streptomycin.	It is too early to predict what the long-term effect of Nydrazid will be. Presumably chronic lesions will not respond better than they do to streptomycin, except insofar as Nydrazid penetrates better. Nydrazid and streptomycin appear to have additive effect in vitro, but it is not known how effective such a combination will be in clinical practice.
Bacterial resistance	Tubercle bacilli with increased resistance to Nydrazid have been isolated from patients. Resistant organisms can also be cultured in vitro, but this phenomenon is virtually eliminated when cultures are exposed to streptomycin and Nydrazid simultaneously.	The clinical implications of bacterial resistance are not completely known. Patients harboring resistant organisms may continue to improve under treatment. The question of delaying the emergence of resistant bacilli by combined therapy must await further study.
Toxicity	Toxic reactions to Nydrazid are chiefly due to stimulation of the central nervous system. They are negligible in the therapeutic dose range, except in patients with convulsive tendencies.	It appears probable that central nervous reactions to Nydrazid can be controlled by barbiturates. But with continued use of the drug, it is not known what sensitivity reactions may occur.

Nydrazid is supplied in
50 and 100 mg. scored tablets,
bottles of 100 and 1000.

For further information on Nydrazid send for the Nydrazid Abstract Folder.

TEMPTATION

Here's a tip: Desoxyn Hydrochloride will make the dieting patient a better bet than before by curbing his appetite and elevating his spirits. More potent than other sympathomimetic amines, Desoxyn produces the desired anorexia with smaller doses. Only one 2.5-mg. or 5-mg. tablet before breakfast and another an hour before lunch are usually sufficient.

In recommended doses, Desoxyn has quicker action, longer effect and a low incidence of side-effects. It is also effective as an adjunct in depressive states accompanying menopause, extended illness and convalescence, and in the treatment of alcoholism and narcolepsy. Available at all pharmacies in 2.5-mg. and 5-mg. tablets, elixir and 1-cc. ampoules. Abbott

action substantially without reaction

For those patients in whom penicillin G causes sensitivity reaction, Cer-O-Cillin provides the same antibiotic action but is substantially free from side effects in most cases.

Upjohn researchers developed Cer-O-Cillin (penicillin O) by replacing the benzyl group of penicillin G with an allylmercaptomethyl group, thus making penicillin therapy available to nearly *all* patients.

For action substantially without reaction . . .

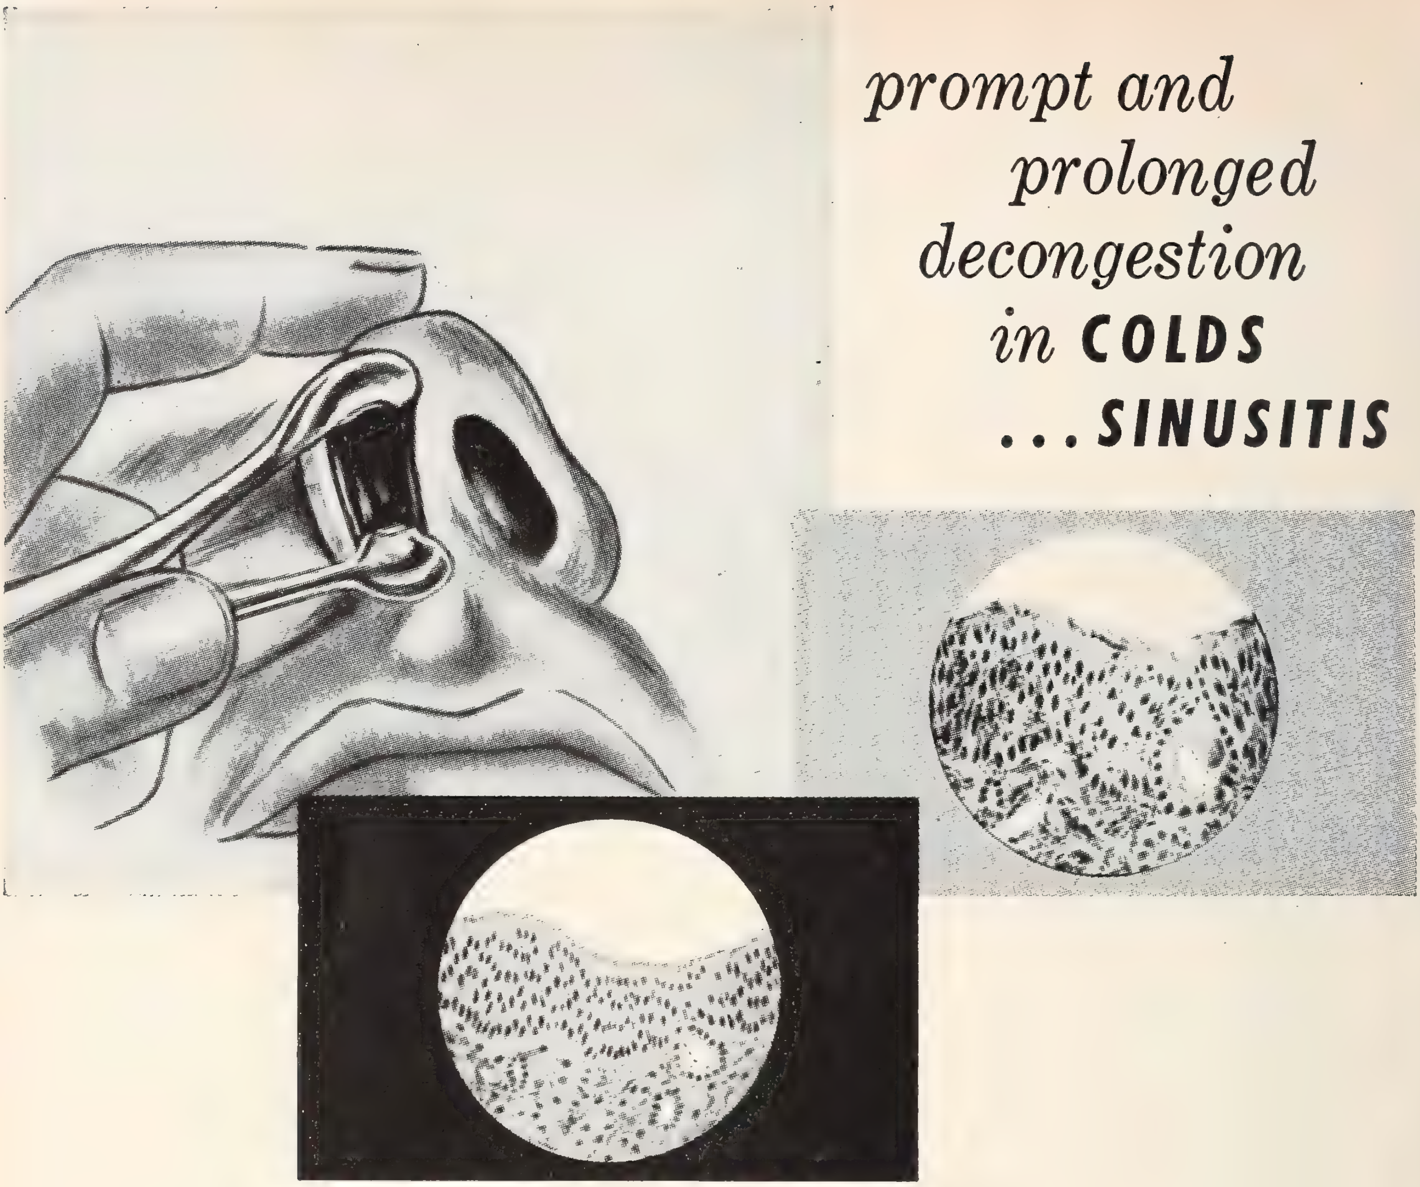
prompt and prolonged decongestion in **COLDS** **...SINUSITIS**



Neo-Synephrine hydrochloride, through immediate and prolonged decongestive action, not only restores nasal patency, but also helps to reestablish and protect the physiologic defense mechanisms of the nasal cavity: sinus drainage and aeration.

Neo-Synephrine hydrochloride is notable for its relative freedom from sting and for virtual absence of compensatory congestion. Furthermore, it does not usually produce systemic side effects such as nervous excitation, cardiac reaction or insomnia.

The decongestive action of Neo-Synephrine hydrochloride is undiminished by repeated use—insuring relief throughout the duration of the illness.

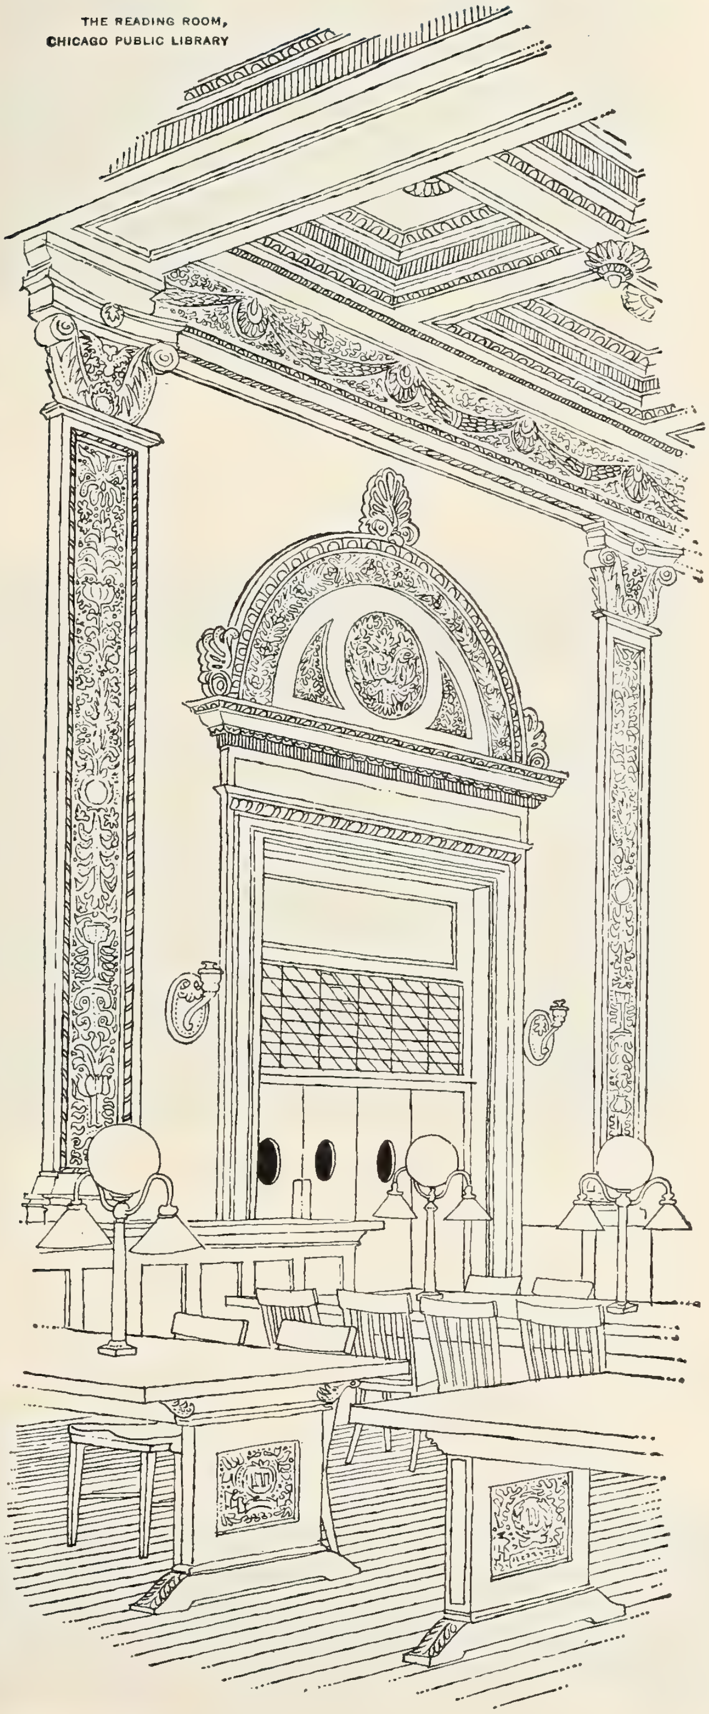
AUREOMYCIN

Hydrochloride Crystalline



THE READING ROOM, CHICAGO PUBLIC LIBRARY

because

Aureomycin penetrates the ocular tissues and fluids, after passing the blood-aqueous barrier.

Aureomycin in 0.5% solution is well tolerated by the conjunctiva.

Aureomycin may be used locally in appropriate solution; or by mouth; or, in emergency, intravenously; or by a combined approach, depending upon the seriousness of the infection.

Aureomycin has proved of value in a number of ocular infections in which other remedies have failed.

Aureomycin has been reported to be effective against susceptible organisms in the following conditions commonly seen by ophthalmologists:

Blepharitis
Conjunctivitis
Dendritic Keratitis
Epidemic Keratoconjunctivitis
Episcleritis
Periorbital Infection
Acute Trachoma
Uveitis

Throughout the world, as in the United States, aureomycin is recognized as a broad-spectrum antibiotic of established effectiveness.

Capsules: 50 mg.—Bottles of 25 and 100.
250 mg.—Bottles of 16 and 100.
Ophthalmic: Vials of 25 mg. with dropper; solution prepared by adding 5 cc. of distilled water.

WHEN DRUG THERAPY

Increases Nutrient Requirements

The administration of many drugs can sharply increase the patient's requirements for various essential nutrients. The presence and action of certain drugs in the organism may alter normal utilization of nutrients to purposes of detoxication of these drugs.

In some instances, drugs may impair absorption of nutrients, increase their destruction within the digestive tract, interfere with their metabolism, or hasten their elimination. With prolonged administration, therefore, unless the intake of various nutrients is increased, deficiency states may be precipitated.

The dietary supplement Ovaltine in milk can significantly increase the nutrient intake of the patient when therapy makes this adjustment necessary. As shown by the table below, it provides substantial amounts of all nutrients known to be essential. Its excellent quality protein furnishes an abundance of all the indispensable amino acids.

Because of its delicious flavor, Ovaltine in milk is universally enjoyed by patients. It is easily digested, bland, and its nutrients are quickly available for utilization. The two varieties of Ovaltine, plain and chocolate flavored, both similar in high nutrient content, allow choice according to flavor preference. Children particularly like Chocolate Flavored Ovaltine.

Doctor Harris builds a new house

You may be certain that he will insist on a good solid foundation for his new house, consistent with his having built a successful medical practice on sound principles of integrity and dependability. These are the qualities he looks for in others. He has found them to be characteristic of those whose products he chooses to prescribe. Just such a company is now making . . .

. . . the hematinic which comes from antibiotic production

Since the antianemia effect of liver was discovered twenty-six years ago, true pernicious anemia has ceased to be a necessarily fatal disease; pharmaceutical refinements have made liver therapy increasingly acceptable; knowledge of the constituents of liver and the nature of anemias has increased. These developments have been helped substantially by teamwork between the Lilly Laboratories and other investigators.

It is now known that several chemically dissimilar substances in liver are effective in macrocytic anemias. For example, vitamin B_{12}, which is also derived as a by-product of Lilly streptomycin production, is usually effective in pernicious anemia. It is ineffective, however, in certain other macrocytic anemias in which folic acid, another natural constituent of liver, is indicated. From investigations such as are continuing in the Lilly Laboratories, it now appears that there are still other unisolated substances in liver which are potent agents capable of producing blood regeneration. Until all of these are identified and their relationships more clearly defined, the use of liver extract in macrocytic anemias will continue as sound therapy.

CANCER DETECTION

Report from the Center at the University of Minnesota

T. BRANNON HUBBARD, Jr., M.D.*
and
DAVID STATE, M.D.
Minneapolis, Minnesota

SINCE the institution of the first Cancer Detection Center in this country in 1937,[4] there has existed considerable controversy among the medical profession regarding the attributes and shortcomings of such centers. Those reports that have appeared in the literature[1,3] have concerned clinics which dealt only with the so-called "accessible" cancers, and which made no attempt to detect gastrointestinal neoplasms. Even as regards only exterior cancers, such reports seem to agree that further refinements in screening techniques are needed to make cancer detection clinics generally practicable.

The Cancer Detection Center at the University of Minnesota was begun on March 1, 1948, with the approval of the Minnesota State Medical Association.[2] Its purposes were threefold:

1. To see if such a program which included search for gastrointestinal cancers, was feasible and practical for use on a broad scale.
2. To evaluate various screening methods, in the hopes of formulating a relatively brief, economical program which could be used throughout the country either in smaller centers or ideally by the individual physician in his office.
3. To benefit immediately those patients who were examined by this center, although obviously they could constitute only a minute fraction of the population in this area.

The following is a brief summary of the results of the four years, March 1, 1948, to March 1, 1952.

Presentation of Data

Material.—Only "symptom-free," apparently well individuals, forty-five years of age and over, are examined. They are instructed (1) to eat no meat products for three days before examination and to bring a stool and urine specimen with them, and (2) to clean the lower bowel by repeated tap water enemas until clear the night and morning before their examination.

Procedure.—A thorough history form is filled out by the patient. This form, based on true and false columns, covers habits, family history, and all symptoms which might conceivably suggest a malignancy.

All are given a routine examination which occupies the greater part of one day.

In the morning:

1. Complete blood count.
2. Urinalysis.
3. Blood Wassermann test.
4. Occult blood in the stool (both by guaiac and benzidine tests) after a meat-free diet for three days.
5. Gastric expression, using histamine (1 dose, 0.5 mg) as a gastric stimulant.
6. A proctoscopic examination by a proctologist.
7. Female patients have a complete pelvic examination by a gynecologist, with Papanicolaou smears.
8. Photofluorogram of chest.

In the afternoon:

1. Ear, nose and throat examination by an otolaryngologist.
2. General physical examination by one of our doctors with correlation of all findings including the history form.

From the Department of Surgery, University of Minnesota Medical School. Sponsored by the Council of the Minnesota State Medical Association and supported in part by the Minnesota Division of the American Cancer Society.

*Dr. Hubbard's present address is 1211 Forest Avenue, Montgomery, Alabama.

The latter doctor then discusses the results with the patient and the patient is told to return to his family doctor for more detailed information. In particular, if any cancer or similar lesion is found, the patient is told to return to his doctor for immediate treatment. No therapy is given at the Center. Each patient is required to give the name of his personal physician, and to the latter is sent a complete résumé of our findings with our recommendations.

TABLE I. TYPES OF CANCER FOUND AT THE CANCER DETECTION CENTER
(March 1, 1948 to March 1, 1952)

Location	Number of Cases
Stomach	10
Colon	19
Duodenum	1
Breast	6
Cervix	4
Ovary	3
Prostate	5
Skin	22
Lymphosarcoma	4
Leukemia	3
Total	77

The above ends the routine examination. Further x-ray studies, aimed at the "inaccessiible" cancers, are taken only for specific indications and at a later date by appointment.

With occasional exceptions, these x-rays are of only two types. They are as follows, and are taken when any one of the listed criteria are present.

1. X-rays of the stomach with barium meal, when one or more of the following pertains:

   (a) Individuals with histamine achlorhydria and hypochlorhydria (less than 30 degrees of free acid).
   (b) Patients with occult blood in the stool.
   (c) Patients with a strong family history of gastric carcinoma.
   (d) Patients with an unexplained hemoglobin level below 11.0 grams.
   (e) Patients with vague symptoms of gastric pathology which in any sense could be interpreted as being due to gastric carcinoma by the examining physician.

2. X-rays of the colon after barium enema, with or without air contrast studies, when one of the following pertains:

   (a) Patients with abnormal findings on proctoscopic examination.
   (b) Patients with occult blood in the stool.
   (c) Patients with an unexplained hemoglobin level below 11.0 grams.
   (d) Patients with a family history of large bowel malignancy.
   (e) Patients who have vague symptoms that could possibly be conceived as being due to malignancy of the large bowel by the examining physician.

TABLE II. PRECANCEROUS LESIONS FOUND AT THE CANCER DETECTION CENTER
(March 1, 1948 to March 1, 1952)

	First Examination	Recheck Examination	Total
Polyps of colon and rectum	532	337	869
Gastric polyps	2	0	2
Kraurosis vulvae	15	7	22
Leukoplakia	115	51	166
Irritated nevi	230	49	279
Polyps of vocal cords	1	0	1
Senile keratosis	139	81	220
Thyroid adenomas	72	34	106

With rare exceptions the other more intricate examinations, such as intravenous pyelography, gastroscopy, et cetera, are not done here but are recommended to the patient's personal physician.

Follow-up.—The personal physician is asked to notify us when the patient returns to him and to let us know if his findings coincide with ours. All patients with the diagnosis of malignancy are followed and a report of the pathological findings is obtained. Thus all cancers listed in the results below are microscopically proven.

All masses, designated by us as "suspicious tumors" are also followed. When such lesions are excised, they are then relegated into the list of malignant or benign tumors as indicated.

All patients are asked to return for recheck examinations which are the same as the first. Such examinations recur at intervals of approximately one year. Remarkably few patients have failed to return for their recheck appointments, and at the present time five "recheck" patients are being examined for every one new patient.

Results.—8,230 examinations have been made on 4,352 patients (2,153 men; 2,199 women). Our findings have been as follows:

1. 77 cancers (including three cases of leukemia). (Table I)
2. 1,632 "precancerous" lesions. (Table II)
3. 2,536 benign tumors.
4. 125 suspicious tumors which required further diagnostic procedures.
5. 6,427 non-cancerous conditions which were worthy of medical attention.

Analysis

If one makes no discount for the original outlay for permanent equipment, including x-ray apparatus, the seventy-seven cancers were found at a cost of approximately $3,400 each. Obviously to each of these seventy-seven patients this was a worthwhile expense. However, as a measure to be applied to the population as a whole, there is some doubt as to the practicability of such an examination as a purely therapeutic venture. Aside from actual dollars there is also, of course, some doubt as to whether such examinations carried out on a nation-wide scale and finding a similar incidence of cancers, would yield results deserving of the time expended by the doctors, nurses and technicians required.

TABLE III. INCIDENCE OF CANCER FOUND AT THE FIRST EXAMINATION IN RELATION TO AGE AND SEX, CANCER DETECTION CENTER (March 1, 1948 to March 1, 1952)

Age	Cancers per 1000 Examinations	
	Men	Women
45-54 years	6.4	6.8
55-64 years	15.8	15.6
65 years +	26.9	12.2
Total	12.4	10.5

Based upon the supposition that early detection of cancer is worthwhile, and that a more economical (re both time and money) examination is desirable, a preliminary analysis of our data has been made:

(A) *Total Results.*—9.3 cancers were found per 1,000 examinations (11.9 cancers per 1,000 first examinations and 6.4 cancers per 1,000 recheck examinations).

(B) *Total Cancers.*—If one breaks down our results in regard to age, sex, first examinations, and recheck examinations, the incidences are as shown in Tables III and IV. It is apparent, and of course is to be expected, that a much more fruitful examination could be done if one dealt only with patients over the age of fifty-five years.

An exception to this rule is the woman with cancer of the cervix, all four of the latter having occurred in patients under fifty-five years of age.

(C) *Gastrointestinal X-rays.*—5,233 stomach x-rays have been made on 2,881 patients, and ten gastric cancers and two gastric polyps have been found. This is an incidence of 3.4 cancers per 1,000 patients or 1.9 cancers per 1,000 x-rays. Although these examinations were based on one or more of the indications listed above, the only characteristics common to all ten gastric cancers were a low free acid on gastric analysis, and an age of over fifty-five years.

If one had taken x-rays only for achlorhydria or hypochlorhydria and only in patients of fifty-five years or more, one would have found 5.1 cancers per 1,000 x-rays or 10.6 cancers per 1,000 patients; the incidence of cancer in the men being 1.7 times that in the women.

TABLE IV. THE INCIDENCE OF CANCER FOUND ON RECHECK EXAMINATIONS, IN RELATION TO AGE AND SEX, CANCER DETECTION CENTER (March 1, 1948 to March 1, 1952)

Age	Cancers per 1000 Examinations	
	Men	Women
45-54 years	2.1	5.2
55-64 years	7.1	7.0
65 years +	12.2	30.3
Total	5.3	7.9

(D) *Barium enema X-rays.*—3,443 colon x-rays were taken on 1,711 patients, and eight cancers and twenty-six polyps were found which were above the reach of the proctoscope. This is an incidence of 2.3 cancers per 1,000 examinations, or 4.6 cancers per 1,000 patients. The indications for x-rays in the case of both the cancers and the polyps were based either on abnormal proctoscopic findings or on the presence of occult blood in the stool. The age of these patients ranged over all three decades, however, and involved both sexes to approximately equal degrees.

If one had taken x-rays based only on proctoscopic findings, or on occult blood in the stool, one would have found 8.8 cancers per 1,000 x-rays or 11.0 cancers per 1,000 patients, and no polyps or cancers would have been missed.

(E) *Papanicolaou Smears.*—Approximately 6,000 smears have been studied. However, all four proven cervix cancers were picked up by biopsy, before the smears were read, and two of the latter were read as false negatives. There is one Class IV smear, not counted as a cancer, which is as yet unconfirmed by repeated and thorough biopsy and curettage. These results suggest that, when a thorough pelvic examination is done, with biopsy of suspicious areas, the Papanicolaou smear may be a rather redundant luxury in women over forty-five years of age; although, of course, it may well be a very valuable procedure when such a pelvic examination cannot be done due to shortages of time or personnel.

(F) *Proctoscopic Examination.*—The worth of this maneuver is shown, both by the fact that of the nineteen cancers of the rectum and colon, seventeen were picked up directly or indirectly by proctoscopy; and by the fact that benign rectal polyps have been found on proctoscopy in one out of eight first examinations, and in one out of ten recheck examinations.

TABLE V. INCIDENCE OF RECTO-SIGMOID POLYPS FOUND AT THE FIRST EXAMINATION CLASSIFIED BY AGE AND SEX
(March 1, 1948 to March 1, 1952)

Age	Men	Women
	Per Cent with Polyps	Per Cent with Polyps
45-54 years	17	8.0
55-64 years	15	9.5
65 years +	17	9.0

As may be seen in Tables V and VI, there was a slightly greater incidence of polyps in men than in women. However, in both sexes the yield from this relatively innocuous procedure was sufficiently high to make it worthwhile.

(G) *Other Tests.*—No cancers were led to by the routine urine examination, Wassermann examination, or chest x-ray, the latter probably reflecting the state-wide chest survey.

Although three leukemias were found, two of these were suggested by lymphadenopathy. Hence, it is probable, especially in view of the inefficacy of treatment at present, that the routine leukocyte count is superfluous in such a program.

Oddly enough, no cancers were found based upon a low hemoglobin alone, and this test may on further examination prove superfluous in asymptomatic patients, when x-rays are taken for the previously described indications.

Discussion

It has been inferred by some that early diagnosis by present-day methods will offer little improvement in our "cure-rate" of cancer. However, that early diagnosis of asymptomatic cancer is of some value is suggested by the fact that, of the seventy cancers found at this center (excluding seven leukemias and lymphosarcomas), 77.1 per cent were early, without demonstrable lymph node metastases: 50 per cent of the stomach cancers, 83 per cent of the colon and rectum cancers, 50 per cent of the breast cancers, 100 per cent of the ovarian and cervix cancers (i.e. Stage I). This proportion of lymph-node-free cases is, of course, considerably higher than that found in the usual hospital population. It is generally recognized that such localized cancers have a much higher survival rate; and even in the stomach malignancies, generally regarded pessimistically, our experience at the University Hospitals has revealed a five-year survival rate of 50.4 per cent in those cases without lymph node metastases at operation.

TABLE VI. INCIDENCE OF RECTO-SIGMOID POLYPS FOUND AT RECHECK EXAMINATION (PATIENTS NEGATIVE AT FIRST EXAMINATION), CLASSIFIED BY AGE AND SEX
(March 1, 1948 to March 1, 1952)

Age	Men	Women
	Per Cent with Polyps	Per Cent with Polyps
45-54 years	10.5	6.8
55-64 years	15.0	9.0
65 years +	10.2	10.9

Moreover, the ultimate salvage resulting from the removal of the 1,632 precancerous lesions cannot be fully evaluated.

Although there is little doubt that a system of examination as has been outlined above is too time consuming and expensive to be applied to the whole population, it should be possible to judiciously modify such an examination until it is brief, economical and feasible. It is the purpose of this clinic to define such a modified program. No attempt has, however, been made to subject the above data to detailed statistical analysis for the following reasons. In the first place the number of cancers found of any one type is as yet too small, and any critical analysis should of course treat each cancer type separately since each one involves different age groups, sex ratios, and symptomatology. Secondly, in spite of the efforts made, one can never be certain that those patients who come to the Center for the first time are truly asymptomatic. It is quite possible that some of such new patients come because they have symptoms, and they are therefore selected. To arrive at any conclusions concerning an ideal examination for the asymptomatic population at large we should deal in our analysis only with "recheck" patients, those who gave negative findings at their first examination, and who came back for re-examination, not because they wanted to, but because they were asked to return.

Nevertheless the above preliminary analysis is suggestively reliable since it coincides quite closely with what we know about these various cancers. For this reason a tentative program is suggested below:

1. Only patients over the age of fifty-five years to be examined.
2. Laboratory work to consist only of gastric analysis and examination of the stool for occult blood.
3. A routine physical examination for all patients.
4. Proctoscopy for all patients, after proper preparation.
5. A pelvic examination consisting only of bimanual palpation, but not including the use of the speculum or of the smear.*
6. X-rays of the stomach in those patients revealing less than 30° of free acid on gastric analysis.
7. X-rays of the colon in those patients showing abnormal proctoscopic findings or occult blood in the stool.
8. X-rays of the chest, only if a state-wide survey has not been made in that area.

It should be re-emphasized that the above is only a theoretical outline, and that final conclusions concerning the ideal program must await the accrual of more material. It should also be said that the effectiveness of any of these examinations, even the simpler ones, such as examination of the skin, breasts, rectum, and vagina, depend entirely for their effectiveness upon a very high index of suspicion. One must look not for the obvious cancer, but for the ulcer or lump which could be benign but *might* be a cancer.

It may also be stressed that the deletion of various details of physical examination and of laboratory examination in the above tentative detection program does not infer that such details are of no value, but that they merely appear less essential if one is striving for economy of effort and time.

Summary

A résumé of the first four years work of the Cancer Detection Center at the University of Minnesota has been presented, and a theoretical program has been suggested by which one could conduct a detection clinic more economically and almost as effectively. Any final conclusions regarding such an "ideal" examination must, however, await the accumulation of larger numbers of unselected, recheck patients who are reliably asymptomatic.

---

*In this age group, such an examination is necessary for the detection of ovarian or fundic cancers. Pelvic examination of women younger than 55 years would be directed more toward cervical cancers and should constitute an entirely separate program.

BENTYL HYDROCHLORIDE AND GLAUCOMA

Chronic simple glaucoma is undiagnosed in one out of every forty people forty years of age or older. Unsuspected glaucoma may be precipitated by the use of atropine, belladonna, and many of the newer autonomic blocking drugs. These drugs have a tendency to increase intraocular pressure and thus bring on an attack of heretofore clinically unrecognized glaucoma.

Two patients suffering from glaucoma have been treated, because of irritable colon syndrome, with Bentyl hydrochloride. Although Bentyl has considerable atropine-like action on the gastrointestinal tract, it does not produce pupillary changes that might influence intraocular pressure. These known glaucoma cases (both were female, aged 60 and 70) received Bentyl 10 mg., four times daily by mouth for two to four weeks. "Intermittent Bentyl therapy has been continued for over one year in each case without producing dilatation of the pupil or an increase in the ocular pressure. Both patients have continued local use of 2 per cent pilocarpine in the eye, which has not interfered with the antispasmodic effect of Bentyl upon the gastrointestinal motility."—From Hufford, A. R.: Bentyl hydrochloride—Successful administration of a parasympatholytic antispasmodic in glaucoma patients. Am. J. Digest. Dis., 19:257-258, 1952.

SOME FUNCTIONAL DISORDERS OF THE SMALL INTESTINE OF CLINICAL IMPORTANCE

Carman Lecture

ROSS GOLDEN, M.D.
New York, New York

TO THE Minnesota Medical Society I wish to express my deep appreciation of the invitation to give the Carman Lecture of 1952. At the time Russell Carman was making his important contributions very little attention was paid by either clinicians or radiologists to the small intestine. He would have been much interested in and would have contributed to the remarkable advances which have occurred in the radiologic study of this important part of the digestive tract, as have his successors in the division of Roentgenology of the Mayo Clinic.

Disease or disorders of the small intestine may be disclosed incidentally during a radiologic examination of the stomach and duodenum, or, in rare instances, during an examination of the colon. The best way to study the small intestine by x-ray is to follow a barium suspension through its entire length by films at regular intervals, and fluoroscopic observations.

The three major indications for a small intestine study are: (1) diarrhea; (2) intestinal bleeding; (3) abdominal pain, particularly located in the periumbilical region or the right lower quadrant, assuming that disease in the more common sites in the stomach and large intestine has been ruled out by appropriate examinations.

I shall review first some facts concerning the motor physiology of the small intestine which seem to have a bearing on the phenomena demonstrable by x-ray methods. I will then discuss some disorders of neurogenic origin, the effect of certain drugs, various conditions associated with gas distention of the intestine and some of the possible physiologic mechanisms involved in these disorders.

Physiology

In spite of much study over many years, much remains to be learned about the basic physiology of the small intestine. However, certain generally accepted facts are of importance in understanding some disorders of the intestine. A more extensive discussion of small intestine physiology applicable to the radiologic examination is available elsewhere.[6,7]

The propulsive movements of the small intestine are composed of contractions of both longitudinal and circular muscle, preceded and followed by relaxation. These movements become disorderly and ineffective in experimental animals when the wall of the intestine is cocainized, and are regarded as reflexes, co-ordinated and controlled through the intramural nervous system. It follows, therefore, that to be normal and effective these movements require proper function of the nervous apparatus in the wall. Bayliss and Starling[2] showed that the first evidence of fatigue of the muscle in the dog's intestine was failure of the wall to relax ahead of a contraction. It has also been shown that these contractions are associated with electrical discharges (Puestow,[16] Smith[19]).

The mucosa of the small intestine, like that of the stomach, by virtue of the muscularis mucosae moves independently of the tunica muscularis. The muscularis mucosae forms and changes the mucosal folds which give the characteristic feathery pattern of the small intestine .

The intestine is innervated by the parasympathetic and the sympathetic divisions of the autonomic nervous system. The fibers of both divisions, along with blood vessels, pass between the two layers of the mesentery of the intestine where they are vulnerable to certain diseases. The intramural nervous system is composed of the myenteric (Auerbach's) plexus and the submucosal (Meissner's) plexus. Both contain ganglion cells and pre- and post-ganglionic fibers of the parasympathetic, and also post-ganglionic fibers of the sympathetic. Both also contain fibers not related to either division but which connect

The Carman Lecture delivered at the annual meeting of the Minnesota State Medical Association, Minneapolis, Minnesota, May 26, 1952.

one short segment of intestine with another; presumably the reflexes which control the propulsive movements operate through these intersegmental fibers.

Stimulation of the vagus (parasympathetic) in animals or giving parasympathomimetic drugs increases tonus and peristalsis in the small intestine. Stimulation of the splanchnics or giving sympathomimetic drugs relaxes the intestine and diminishes peristalsis. Some of the reactions observed in the human intestine, however, suggest that the nervous control is not as simple as this sounds.

Evidence has been presented that stimulation of the parasympathetic produces acetylcholine, and that the injection of acetylcholine causes effects similar to parasympathetic stimulation. It has also been shown that sympathetic stimulation produces a substance similar to adrenalin in its effects. These two substances became known as chemical mediators.

The production of acetylcholine by an enzyme called "choline acetylase" (Nachmansohn and Machado[15]) requires among other things the correct concentration of potassium ions and the presence of a thiamin compound. Insufficiency of either of these or of other ingredients would interfere with the production of acetylcholine and, therefore, with the flow of nerve currents and with their effects on muscle cells.

Acetylcholine is inactivated very rapidly by a specific enzyme, "acetylcholine esterase," which is present only in nerve tissue. This enzyme is inhibited or destroyed by a number of substances including prostigmine. The administration of one of these inhibitors has an effect similar to stimulation of the parasympathetic system because it intensifies and prolonges the effect of any acetylcholine which happens to be present. However, an inhibitor such as prostigmine will have little or no effect if acetylcholine is reduced in amount or absent. It is generally agreed that acetylcholine is necessary for the passage of the nerve impulse along the nerve fiber and across the synapse and that it must be rapidly destroyed to permit the passage of the next impulse.[3]

The mechanism by which adrenalin produced by the sympathetic nerves counteracts the effect of the parasympathetic is apparently not known, but it acts in some respects like an inhibitor of acetylcholine.

X-Ray Examination of the Small Intestine

Examination of the small intestine by x-ray methods gives information, (1) about the transit time from the ingestion of the opaque material to its entrance into the cecum; (2) about the width of the lumen as a manifestation of tonus; and (3) about other less important manifestations of the motor function. The transit time varies to a degree with the character of the barium suspension. With barium in normal saline the transit time varies in apparently normal individuals from one to four hours. The width of the barium shadow varies from 2.5 to 3.0 cm. in the jejunum to 2.0 to 2.5 cm. in the ileum. Excessively rapid transit time and a narrow lumen can be regarded as a manifestation of excessive parasympathetic influence.

"Normal" is defined in the dictionary as average, and "abnormal" would, therefore, be defined as a deviation from the average. But in medicine the deviation must be of sufficient degree to be of clinical significance. The borderline between normal and abnormal is not often sharp and distinct.

Disorders Consistent with Parasympathetic Overactivity

The influence of emotional states on the gastrointestinal tract is well known. The effect may be diarrhea or pain or both.

Psychosomatic diarrhea in a number of cases has been associated with a very rapid transit time. Using a barium-saline suspension the opaque material reached the cecum in approximately fifteen minutes in some of these patients. One young woman was having up to fifteen watery movements a day at the time of admission. This patient's diarrhea quickly stopped under psychotherapy, but the rapid transit time in the small intestine persisted. In these cases the colon is also hypermotile, which does not allow sufficient time for the water in the contents of the small intestine to be absorbed in the large intestine.

A woman, aged seventy, was admitted in 1931 because of attacks of abdominal pain which began thirty-five years previously after desertion by her husband, leaving her five young children to support. The small intestine study disclosed extreme hypertonicity of the lower jejunum and proximal ileum (Fig. 1). Her symptoms were temporarily relieved by atropine, a parasympathetic inhibitor. Extensive clinical study failed to disclose an organic reason for the attacks of pain which she was still having in 1949 at the age eighty-eight. The clinical picture and the abnormal intestinal physiology shown by x-ray examination in 1931 and again in 1949 can be best explained as excessive parasympathetic influence of psychogenic origin.

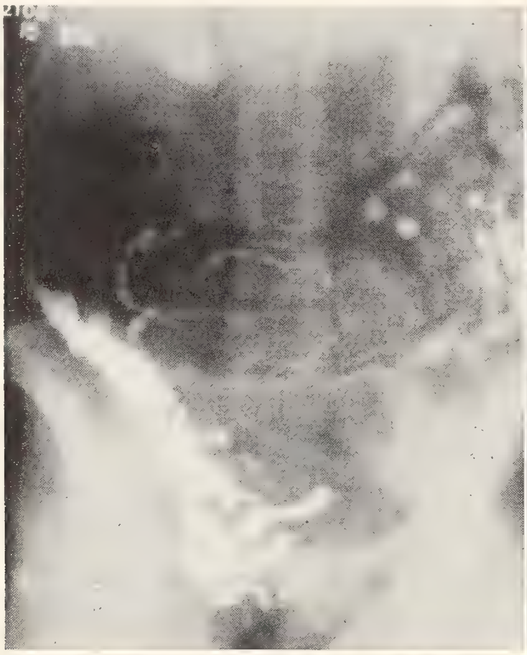

Fig. 1. (*left*) Hypertonicity of the small intestine associated with attacks of abdominal pain of psychosomatic origin.

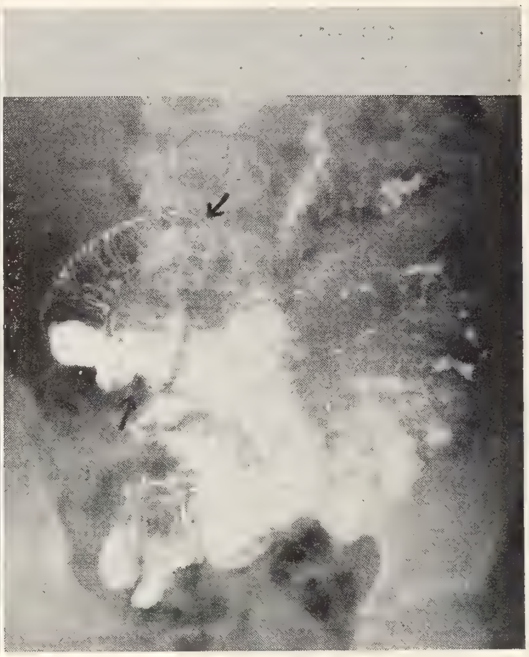

Fig. 2. (*right*) Functional Intussusception. An eleven-year-old boy (Unit No. 877251) came to the Babies Hospital because of attacks of abdominal pain which began following the death of his father five years previously. A small intestine study disclosed at least two temporary intussusceptions, one of which is reproduced above. Careful clinical study led to the conclusion that his symptoms were of psychosomatic origin and that his mother needed psychiatric treatment even more than he did. After a congenial stepfather joined the family, the attacks of pain recurred less and less frequently and finally ceased. A second roentgen study about six months after the first showed nothing abnormal. (*Courtesy of Dr. John Caffey.*)

Functional intussusception, that is, intussusception without organic disease of the wall, was produced in monkeys[22] by stimulation or extirpation of the cortex of the premotor area and was associated with overactivity of the intestine. The injection of parasympathetic stimulants in cats caused "contraction rings" in the small intestine, which either remained stationary or moved along and sometimes occluded the lumen.[20] Kuntz[11] states that a failure of the mechanism co-ordinating contraction and relaxation is apparently the initiating factor in the intussusceptions of infancy. Falor[5]and Keith[10] saw several intussusceptions at laparotomy in soldiers wounded in battle in Western Germany with no direct injury to the intestines themselves.

Teitlebaum and Arenson[21] showed that recurrent, self-reducing intussusceptions in the small intestine of children can be demonstrated by x-ray methods. We have seen this in adults and also in a number of young children with celiac disease, where it is probably the mechanism producing the abdominal pain of which celiac children not infrequently complain. Figure 2 shows an example of functional intussusception of psychosomatic origin in a child.

Kuntz[11] regards allergic reactions as functional disturbances which involve primarily tonic changes in the musculature of viscera. These reactions are to be attributed to deviations from the normal autonomic balance, produced by "heightened parasympathetic or cholinergic reactivity."

Allergic reactions in the gastrointestinal tract responsible for symptoms are uncommon and are usually difficult to detect. We have seen a transit time of one-half hour or less and hypertonicity, particularly of the lower half of the small intestine, in patients whose symptoms were relieved by the elimination of some food, for example milk or eggs, from the diet. However, allergic phenomena manifest many vagaries. A rapid transit time and hypertonicity of the intestine are merely evidences of parasympathetic overactivity which in any given instance might be the background for allergic responses, and therefore do not justify a diagnosis. The examination of the small intestine is done with opaque material from which possible allergens are excluded. In the presence of an allergen, transit time may be slowed and abnormal segmentation of the barium shadows may appear.

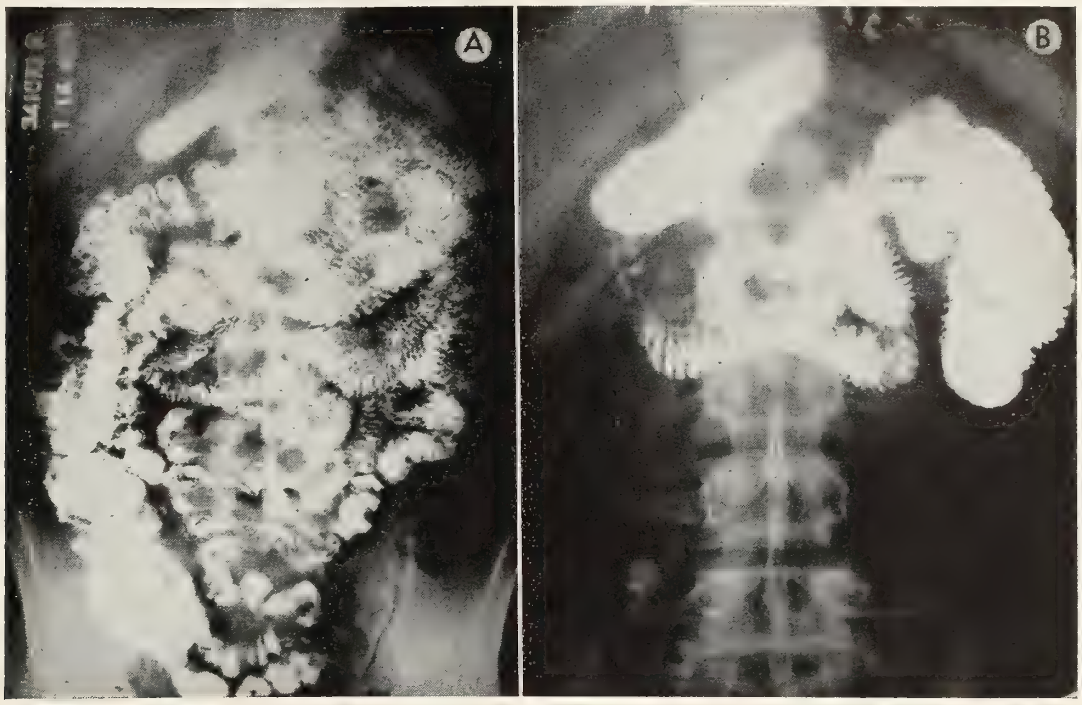

Fig. 3. Parasympathetic inhibition by banthine in a man twenty-three years old with a history of allergy. (*A.*) The half-hour film, January 14, 1948, shows the head of the barium column in the midtransverse colon. The stomach was empty in one hour. At a similar examination on February 2, 1950, the barium entered the cecum and the stomach was empty in one and one-half hours. (*B*) On February 14, 1950, the patient received 100 mg. of banthine by mouth. This film, five and one-half hours after the ingestion of barium, shows a large amount of opaque material remaining in the stomach and the head of the column in the proximal part of the jejunum. The barium did not begin to enter the cecum until about nine and one-half hours. This illustrates the retarding effect on gastrointestinal movements of the parasympathetic inhibitor.

Parasympathetic Inhibition

Physiologists have long known that atropine and certain other drugs prevent or reduce the effect of parasympathetic stimulation and of parasympathomimetic drugs. More recently another drug of this type called banthine has been put on the market and has been used largely to reduce gastric secretion, which is stimulated by the vagus. Its effect has been shown to be more prolonged than that of atropine.

Banthine also has a definite effect on the motor function of the small intestine. As shown in Figure 3, it produces hypotonicity and considerable slowing of the transit time. It has been useful in some patients with symptoms and signs consistent with excessive parasympathetic effect. In two of our cases it produced mild paralytic ileus. Both of these patients had ulcerative colitis with involvement of the rectum. It has long been known that rectal irritation produces stimulation of the sympathetic. In these cases, therefore, in addition to this abnormal sympathetic stimulation, the banthine produced an inhibition of the counteracting parasympathetic influence. In fact, one of these patients found that he could control his abdominal distention by reducing the dose of banthine.[12]

Parasympathomimetic Drugs

The effects of parasympathetic action may be intensified and prolonged by any drug which inhibits choline esterase and thus prevents the destruction of acetylcholine (e.g. prostigmine, eserine, etc.), or by the use of an acetylcholine derivative (e.g. mecholyl, urecholine, etc.). These drugs are useful in the investigation of the motor phenomena of the small intestine.

Occasionally patients are encountered who have abdominal pain or distention, with a slow transit time. The symptoms in a number of these have been relieved by parasympathomimetic drugs. We have found that urecholine can be administered by mouth in doses which have a definitely stimulating effect upon a sluggish stomach and intestine without producing unpleasant side effects and which are followed by relief of symptoms.

Ingelfinger and Moss[9] made studies of the motor activity of the intestine by means of a balloon in two cases of sprue. They found evidence of low tonus and sluggish contractions. Injection of prostigmine produced slight or no response but a prompt strong response followed the injection of mecholyl. They concluded that in these cases the intramural nervous apparatus of the intestine was unable to elaborate active acetylcholine.

May and McCreary[14] showed that the injection of mecholyl in children with celiac disease, in which disordered motor function of the intestine occurs, was followed by an increase in intestinal movements and in the absorption of glucose.

The observations of Ingelfinger and Moss were reproduced in a sprue patient at the Presbyterian Hospital, using barium instead of a balloon.[7]

In one instance, distention suggesting a paralytic ileus appeared about eight days after amputation of the breast for carcinoma in a woman aged seventy-five. No cause for the persistent distention could be found. Prostigmine produced no response, suggesting a lack of acetylcholine. Administration of urecholine, however, was followed by prompt disappearance of the distention and uneventful recovery.

These observations indicate that under certain conditions insufficient acetylcholine is produced in the intestinal wall for reasons which are not clear. Because acetylcholine is necessary for the transmission of nerve impulses, the result of this lack would be manifested along the axone as interference with reflexes as well as at the effector cell. Could the apparent need for more parasympathetic influence in these individuals be analogous to the physiologic disorder of myasthenia gravis in skeletal muscles?

Sympathetic Overactivity and Intestinal Distention

The sympathetic may predominate because of: (1) overactivity of the sympathetic itself; or (2) insufficiency of the parasympathetic.

Overactivity or predominance of the sympathetic division of the autonomic nervous system theoretically should have effects similar to those of a parasympathetic inhibitor. General peritonitis is frequently associated with paralytic ileus. Arai[1] showed in cats that experimental peritonitis resulted in slowing movements of the small intestine but this effect would not result if the splanchnics had been previously sectioned or if choline was injected. Arai concluded that the effect of peritonitis on the intestine was the result of overstimulation of the sympathetic. Considerable experimental evidence is available which indicates that epinephrine inhibits the action of acetylcholine, analogous to the effect of atropine.

Volk, at the Presbyterian Hospital, found no electrical activity in the intestine of a patient with paralytic ileus caused by an appendiceal abscess. As the patient improved, electrical activity was recorded before intestinal movements and before audible evidence of peristalsis could be detected.

Extreme distention of the intestine occurred in a strong 18-year-old boy who suddenly developed severe pain in the back and muscle spasm from what was later shown to be a herniated lumbar intervertebral disc. This distention disappeared quickly when the pain was relieved but reappeared on two later occasions when the pain recurred. In this case, the distention amounted to a paralytic ileus, was associated with distention of the bladder, and can be explained on the basis of sympathetic stimulation resulting from the pain and muscle spasm. Similar phenomena in a mild form have been associated with lumbar myositis, ureteral colic, et cetera. Unfortunately a satisfactory sympathetic inhibitor, like banthine for the parasympathetic, is not available, so that this physiologic hypothesis cannot be tested directly.

Intestinal Distention in Conditions with Insufficient Production of Acetylcholine

Banthine, a parasympathetic inhibitor, either depresses the production of, or reduces the effect of, acetylcholine. As mentioned above, this drug can cause gas distention of the intestine, presumably because the depression of the parasympathetic permits the sympathetic to become predominate. Distention may occur by this mechanism in any condition in which the production of acetylcholine is insufficient.

Administration of excessive amounts of intravenous fluid causes hypoproteinemia with edema and gas distention of the intestine. Under these conditions, this type of paralytic ileus may occur after operation or may complicate mechanical ileus. Edema of the lungs, with or without peripheral edema, may develop. Intestinal distention occurred in a burn case receiving large amounts of intravenous saline. No response to prostigmine is obtained in such cases, which suggests that acetylcholine is not being produced in sufficient quantity to cause an effect on the muscle or else that the muscle becomes incapable of responding to acetylcholine when the inhibitor of acetylcholine esterase is given. The distention disappears when the excessive fluid intake is discontinued and the blood protein returns to normal.

Edema fluid in the intestine collects in the submucosa. Because the submucosa extends into the mucosal folds (valvulae conniventes), the fluid widens these folds (Fig. 4). This widening of the folds in the presence of edema can often be detected in the shadows of gas-distended loops of jejunum. These mucosal folds appear as fine lines running across the gas shadows; as edema develops these cross striations become two to four times the normal width, may become indistinct and even disappear.

A low blood potassium produces the same effect even in the presence of normal blood protein. A loss of potassium occurs after operations and is aggravated by excessive administration of intravenous saline. According to Randall and coworkers,[17] symptoms of hypopotassemia usually appear from four to nine days after the operation, drowsiness, languor, "chronic ileus," scanty urine and edema. The first signs appear when the potassium level descends to 3.5 meq./L (normal 4 - 5 meq./L), and at 2.6 meq./L or less the symptoms become severe. This distention of the intestine is also not relieved by prostigmine, suggesting that the amount of acetylcholine available is insufficient to affect the muscle. The proper concentration of K ions is necessary for the production of acetylcholine and hence for the transmission of nerve impulses. Winter, Hoff and Dso[23] put rats into potassium deficiency and found reduced tonus and rhythmicity of the whole digestive tract, but particularly of the stomach and small intestine.

The amount of potassium in the blood serum may not give a correct picture of the electrolyte balance. The level in the blood may be normal in the presence of an intracellular deficit or may be low when potassium ions are rapidly leaving the blood to go into cells in which a deficit has occurred.

According to experimental evidence[13] potassium accelerates the production or the release of acetylcholine, which is counteracted by calcium and magnesium. Movement of potassium ions plays a part in the transmission of nerve impulses. Possibly these mechanisms are disturbed in the presence of a potassium deficit. The rapidity of recovery following the administration of potassium suggests that this disorder of either nerve or muscle function is easily reversed.

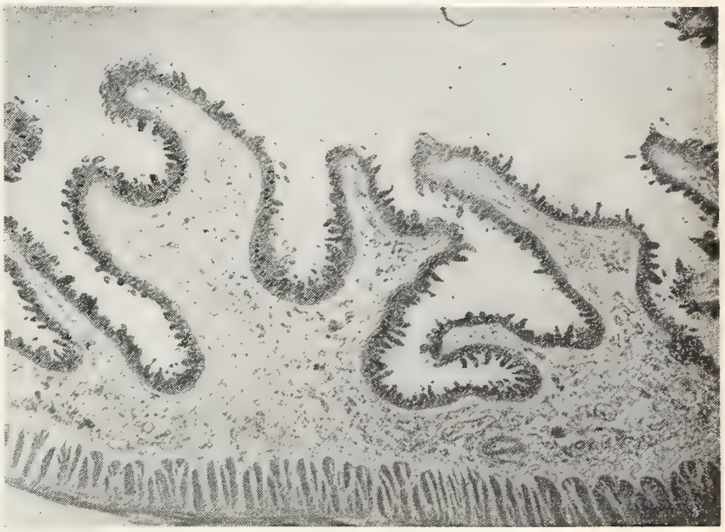

Fig. 4. Edema of the intestine due to hypoproteinemia in subacute yellow atrophy of the liver. The total blood protein was 5.0, albumin 3.1. The fluid is collected in the submucosa, not within the mucous membrane, and has produced a widening of some of the folds. This widening of the folds can sometimes be detected on films of the gas-distended intestine. The separation of the bundles of circular muscle is the result of artefact, not of edema. (*Courtesy of Dr. Edith Sproul.*)

Gas Distention with Disease of the Intestinal Wall

It seems advisable to point out that certain organic diseases of the wall of the intestine or of the mesentery may be associated with gas distention and that this may be differentiated with difficulty from gas distention of functional origin. Three organic diseases are worthy of mention in particular.

Scleroderma may involve the digestive tract. The esophagus is the most frequent site. However, Hale and Schatzki[8] found dilatation of the small intestine with a slow transit time in four of twenty-two patients with scleroderma. In one case prostigmine and in another mecholyl, a derivative of acetylcholine, failed to produce an effect. The lack of response to mecholyl is particularly significant and indicates that the intestinal wall is incapable of responding to acetylcholine and therefore to parasympathetic stimulation.

Amyloidosis of the intestine may give the picture of ileus and may result in operation for intestinal obstruction.[18]

Dr. R. A. Powers, Palo Alto, California, sent me films and pathologic material on a patient in whom the symptoms of mechanical ileus were present. Microscopic examination of the wall of the intestine showed amyloid deposits in the intramural nerve ganglia as well as replacing muscle fibers.

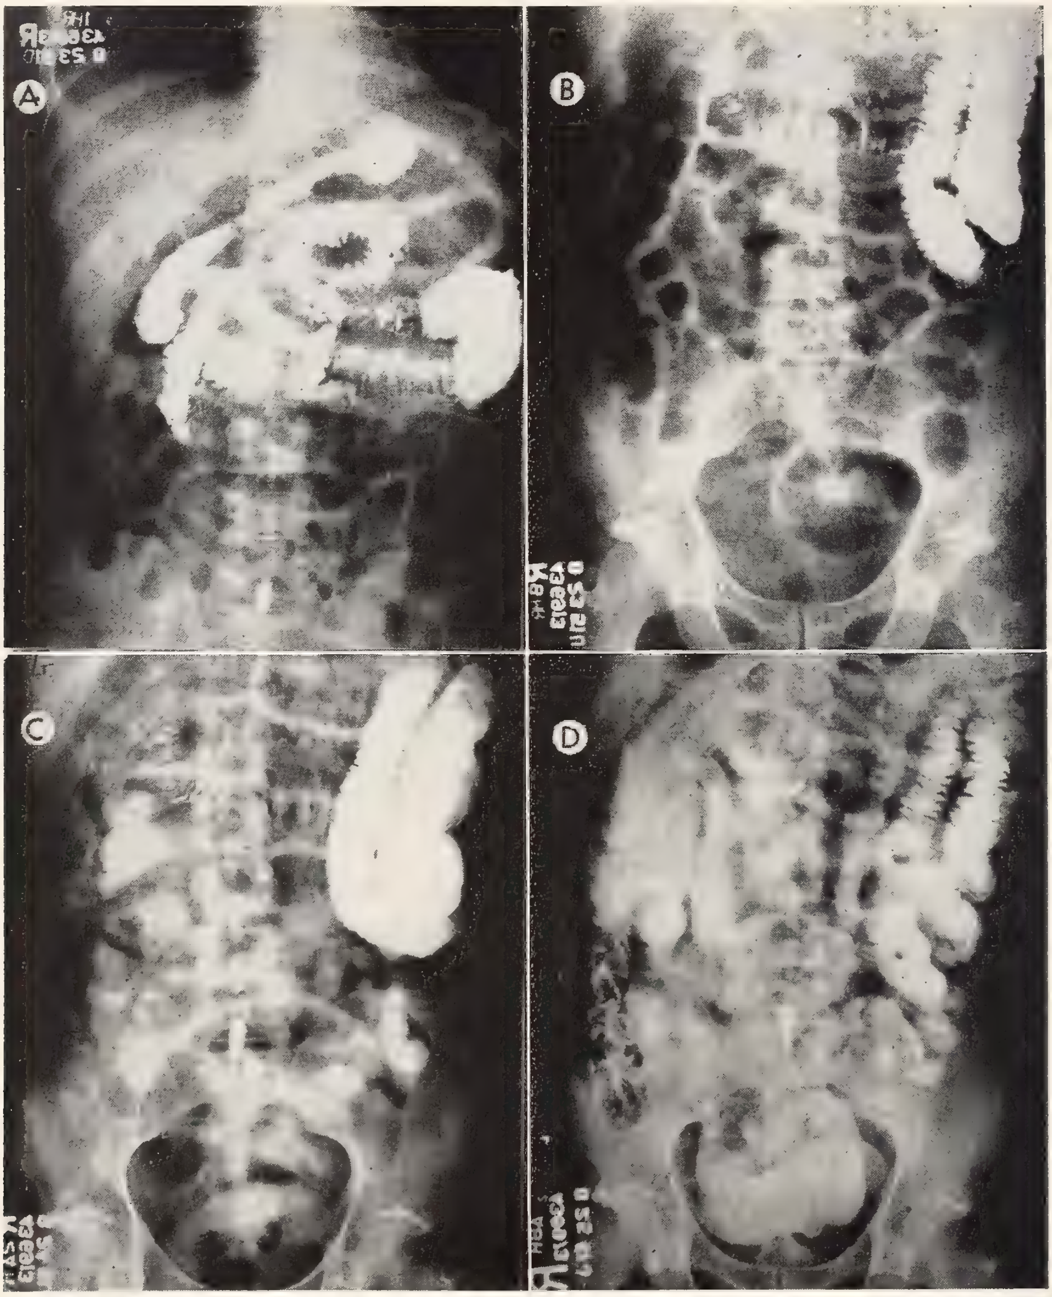

Fig. 5. Slow movement of barium in amyloidosis of the intestine. (*A.*) One hour after taking barium. The proximal loops of jejunum are filled and show wide mucosal folds. (*B.*) At eight hours the head of the barium column is in the middle of the jejunum. The thickness of the wall of the intestine is well shown on this film. (*C.*) At twenty-four hours a little barium is distributed through the ileum, but most of it still remains in the jejunum. (*D.*) At forty-eight hours most of the barium remains in the jejunum and ileum. Very slow movement of intestinal contents does not necessarily mean obstruction but, as in this case, may result from inability of the intestine to contract. The pateint was a man aged forty-two (Unit No. 048643) with albuminuria for ten years, mild neurological symptoms two years, and abdominal symptoms only about four months. Amyloidosis was shown by biopsy of the gum and two months later at autopsy.

A recent patient at the Presbyterian Hospital had persistent gas distention for several weeks and a very slow transit time, with no response to prostigmine or to urecholine (Fig 5). Lack of response to this derivative of acetylcholine suggested that possibly the muscle was unable to react because of disease of the intestinal wall. For this reason, amyloidosis was suggested as one possible explanation, and two months later at autopsy the intestinal wall was found to be extensively involved by amyloid. This case illustrates the importance of approaching the problem of diagnosis of intestinal disorders from a physiologic standpoint and the value of tests with physiologic drugs in the search for explanations of these disorders.

Organic disease of the mesentery may cause gas distention and very slow movement of the intestine. In one case reported by me tremendous dilatation of the ileum was associated with and apparently caused by carcinomatous infiltration of the mesentery from linitis plastica carcinoma of the stomach demonstrated at operation.[7] Several months later the intestine on x-ray examination appeared normal in width. This patient died elsewhere about nine months later. A hypothetical explanation can be offered on the basis of denervation of the intestine by the carcinomatous infiltration of the mesentery and the resulting increased sensitivity to adrenalin of the intestinal musculature which would produce dilatation. This sensitivity has been shown in animal experiments to decrease with the passage of time. The interesting phenomena of denervation are described at length by Cannon and Rosenblueth[4] and by Youmans.[24]

Other diseases of the mesentery may cause moderate dilatation of the intestine with little or no gas distention, e.g. sclerosing mesenteritis, and regional enteritis with fibrosis of the mesentery.[6]

Summary

Familiarity with certain aspects of the motor physiology is a necessary approach to an understanding of some of the disorders of the small intestine encountered in x-ray examinations. Neuromuscular physiology and the chemical mediator theory are particularly important.

Excessive influence of the parasympathetic based on emotional reactions can produce rapid passage of intestinal contents through both small and large intestines with diarrhea, hypertonicity, functional intussusception and can apparently also provide the background for allergic reactions.

Parasympathetic inhibition with slowing of intestinal movement and reduction of tonus can be produced by parasympathetic inhibitors, particularly by a new drug "banthine." Too much parasympathetic inhibition may result in gas distention, a type of paralytic ileus. Evidence has been presented that adrenaline and therefore sympathetic stimulation prevents the action of acetylcholine on the muscle.

Parasympathomimetic action can be produced by inhibiting acetylcholine esterase and preventing the destruction of acetylcholine, provided sufficient acetylcholine is present. Injection of an acetylcholine esterase inhibitor may be used as a rough test to indicate whether acetylcholine is present in approximately normal amounts. In some patients administration of an acetylcholine derivative is necessary to get a parasympathomimetic effect.

Gas distention of the intestine may result from a number of causes, which apparently inhibit movement by depressing the effect of the parasympathetic. This has been seen (1) with severe pain in the back and with acute peritonitis, apparently through the mechanism of excessive stimulation of the sympathetic; (2) with hypoproteinemia; (3) with hypopotassemia; (4) with an apparent lack of acetylcholine in the intestinal wall of unknown origin and relieved by giving urecholine.

Gas distention is also seen with certain organic diseases of the intestine, (1) scleroderma, (2) amyloidosis, (3) carcinomatous infiltration and probably other disease of the mesentery.

INTRA-ARTICULAR USE OF HYDROCORTISONE IN RHEUMATIC DISEASES

PAUL J. BILKA, M.D.
Minneapolis, Minnesota

ADEQUATE evidence is available that cortisone exerts a definite anti-inflammatory action on many tissues in their response to physical trauma, chemical irritation, infection, and hypersensitivity.[1] This non-specific ability to suppress the signs of inflammation is also shared by the closely related compound hydrocortisone. Corticotropin, which stimulates the adrenal cortex to produce these and other compounds, exerts a similar effect. In some instances, as in certain bacterial and viral diseases, this repression of the inflammatory response can be harmful in that it prevents the development or maintenance of a natural barrier to the spread of infection. In many other instances, however, especially in the group of disorders designated "collagen diseases," and in various allergic phenomena, which are associated with sterile inflammation, these drugs have a beneficial and at times life-saving value.

In addition to its effectiveness by systemic administration, the local application of cortisone has demonstrated an anti-inflammatory effect in various diseases of the eye[7] and the skin.[2] Hollander et al[4] extended the use of cortisone to intra-articular injection in patients with arthritic diseases. They found only a mild local suppressive action from cortisone, but hydrocortisone produced a very marked local anti-inflammatory effect. Their patients with osteoarthritis received benefit for an average of three weeks and patients with rheumatoid arthritis received benefit for an average of about eight days following one injection of 25 mg. hydrocortisone acetate.

The purpose of this report is to present in some detail the results of the local use of hydrocortisone acetate in a group of arthritic patients in order to define more clearly the place of this new agent in the therapeutic armamentarium of the medical practitioner.

Method of Study

Fifty-seven patients were given a total of ninety-two intra-articular injections of which seventy-six were hydrocortisone acetate and sixteen were cortisone acetate. Twenty-eight patients had rheumatoid arthritis, twenty-four patients had osteoarthritis, three patients had periarthritis of the shoulder, and one each had chronic gouty arthritis and staphylococcal septic arthritis. The greatest number of injections were into the knee joint; next most frequent was the hip joint; and there were two elbow and one wrist injections. All injections were performed as out-patient clinic or office procedures. Initially, procaine was used for local anesthesia, but in a short time it was felt that most injections could be done without this preliminary step, especially if a 22-gauge needle was used. It is the author's impression that injection of the knee joint from the lateral direction is less painful than medial injection.

The dosage used in the majority of instances was 37.5 or 50 mg. of hydrocortisone acetate suspended in a saline solution at a concentration of 25 mg. per cc.* A few injections of as high as 87.5 mg. were given but there appeared to be no essential difference in the degree of relief or its duration with these various doses. In several of the earlier rheumatoid arthritic patients who were given just 25 mg. of hydrocortisone acetate, it was the impression that the duration of benefit was two to three days shorter than when the larger dosage was given, although in a few instances this difference was not observed.

The dosage of cortisone acetate* was 100 mg. in all instances except one, when 50 mg. was given to a patient who previously had experienced a moderate flare in her knee joint for twelve hours after injection of 100 mg. This injection also produced a flare which, however, lasted only six hours. Each flare was immediately followed by marked local improvement. This transient and apparent irritative action of the cortisone acetate was observed in one other patient.

In patients with rheumatoid arthritis the objective criteria such as joint swelling, tenderness and increased range of motion, following the intra-articular injection of these compounds were so obvious that it was felt that there was little

TABLE I. RESULTS IN TWENTY-THREE PATIENTS WITH RHEUMATOID ARTHRITIS TREATED WITH INTRA-ARTICULAR HYDROCORTISONE ACETATE.

Grade of relief.	No. patients.	Average Duration of relief in days.
0	1	0
1 (10-25%)	1	4
2 (25-50%)	4	8 -12
3 (50-95%)	16	10-21
4 (essentially complete relief)	1	28

need for control placebo injections. Nevertheless, saline was injected in two patients who had obtained definite improvement from hydrocortisone, one of whom also obtained benefit from cortisone, and in neither instance was any subjective or objective change noticed. Also, with few exceptions, repeated injections of the same steroid in the same patient produced strikingly similar responses. In osteoarthritis, however, a very different situation pertains. Evaluation of these patients rests almost entirely on subjective phenomena. By very careful inquiry as to the distance the patient can walk without pain, the time it takes to limber up after a rest period, the disappearance of a limp, etc., these subjective data can be rendered quite valuable, but the marked spontaneous variation in symptoms which these patients experience is familiar to patient and physician alike. Therefore, in four patients with osteoarthritis of the hip joints who had obtained some benefit from hydrocortisone, control injections of saline were made in three and procaine was used in the fourth. In all instances, a comparable degree of improvement followed the control injection. In one patient, an objective increase in hip flexion by 15 degrees followed each procedure. One sixty-six-year-old man with severe osteoarthritis of the knees (including the presence of multiple loose bodies) obtained no relief following an intra-articular injection of 1 cc. of 1% procaine. On five other occasions he has obtained marked relief lasting two to four weeks following injections of cortisone or hydrocortisone. Two patients with mild chronic osteoarthritis of both knees received 1 cc. of saline in one knee and 50 mg. hydrocortisone in the other knee: one patient reported a mild improvement, estimated at 5 to 10%, in each knee; the other reported no improvement in either knee. It is apparent, therefore, that the interpretation of uncontrolled observations, especially in patients with chronic osteoarthritis treated with this or any agent is difficult and hazardous.

Rheumatoid Arthritis

Twenty-three patients with rheumatoid arthritis were given intra-articular injections of hydrocortisone acetate into their knee joints. The results are summarized in Table I.

In one patient no effect was noticed and in another only a minimal improvement was recorded. All other patients noticed very appreciable subjective and objective improvement. The improvement was limited to the injected joint and in several instances coincidental flares occurred in other joints. Some patients noticed improvement within four to six hours, most patients were aware of improvement within twelve hours after the injection, and all noticed it by twenty-four hours. Maximal subjective improvement occurred by the second day, and this was usually the time that the knee joint swelling and tenderness was at a minimum. This state then persisted for seven to twelve days, when gradual return of swelling and pain occurred over the next three to seven days. In a few patients, the return of symptoms was more rapid, and in several patients, there was some persistent improvement for several weeks. No significant declines in sedimentation rate were noticed. No adverse local or systemic reactions were observed.

In addition to the knee joint injections, two patients were given 50 mg. hydrocortisone acetate into involved elbow joints. A grade 3 improvement occurred in each case which lasted over three weeks. Some persistent benefit was present one month and one and a half months later respectively. Another patient was given 25 mg. hydrocortisone acetate into the medial aspect of a swollen right wrist. A grade 2 improvement, localized to just the medial half of the wrist, occurred, and lasted for one week.

Seven patients with rheumatoid arthritis were given a total of fourteen intra-articular injections of cortisone acetate into their knee joints. The results are summarized in Table II.

Two patients, on a total of four occasions, developed increased pain lasting six to twelve hours after the injections, but each such episode was then followed by a grade 3 improvement lasting four to nine days. One patient obtained a complete remission of knee joint symptoms following a single injection of 100 mg. of cortisone acetate. There then developed rather rapid improvement in the patients other joints. This coincidental spontaneous remission was still in evidence nine months later.

It is apparent that while cortisone acetate has a definite local anti-inflammatory effect, its action is less reliable and only about half that of hydrocortisone acetate.

The practical value of this procedure in rheumatoid arthritis is subject to serious limitations. In most patients, the disease process is polyarticular, and rather little is to be gained from temporary improvement in just one or two joints. However, there are definite instances of marked value. A case in point is a young nurse whose most serious involvement is the right knee, and by injecting this joint every third week she has been able to continue work. In several instances the local injection of hydrocortisone acetate seems to have facilitated the employment of physical therapy and the more rapid reduction of knee flexion contractures.

Knee joint synovial biopsies,[6] before treatment, were performed in six patients. In three patients, repeat biopsies were performed on the fifth or seventh day after the intra-articular injection of hydrocortisone acetate. A slight decrease in the tissue reaction was thought to be evident in one patient but no change occurred in the other two. One of these patients was then continued on weekly intra-articular injections of 50 mg. hydrocortisone acetate despite the non-return of symptoms. A week after the third injection, or after an asymptomatic period of three weeks, the biopsy was repeated. The improvement in the histologic picture is evident from the comparative biopsies (Figs. 1, 2, 3). Peculiarly, the patient's knee joint improvement persisted for over one month following her fourth and last weekly injection, whereas on two previous occasions improvement lasted only ten to fourteen days. This raises the question as to the possibility of producing more marked, and perhaps longer enduring, improvement through the continuous suppression of the local tissue reaction for a month or more.

4	1	28 plus

Recently Goldman, O'Hara and Baskett[3] have reported the detection of crystals of cortisone and hydrocortisone some months after their injection into the normal skin of man.

Osteoarthritis

Twenty-four patients with osteoarthritis were given intra-articular injections of hydrocortisone acetate. One of these patients also was given cortisone acetate intra-articularly. Sixteen of the patients had osteoarthritis of the knees; eight had osteoarthritis of one or both hips. Knee joint biopsies were performed in two patients who seemed to have somewhat greater synovial reaction than is ordinarily seen in osteoarthritis. In each instance the histologic picture was consistent with that seen in osteoarthritis.

The results in the eight patients with hip involvement are summarized in Table III.

The one patient who obtained a complete remission of symptoms was a man, fifty-six years old, who twisted his left hip while bending over to inspect a roller in a paper mill. He developed immediate hip pain which recurred on any attempt to bend or to bear weight on the left hip. Physical examination showed slight limitation in flexion and abduction of the left hip, and x-ray examination showed slight narrowing of the hip joint space with minimal hypertrophic spurring. The patient had been disabled from work for four months. Twelve hours after the injection of 37.5 mg. hydrocortisone acetate into the left hip joint (checked by film while the patient was on the x-ray table), there was complete relief of symptoms and the patient returned to work in a few days. He continued to be without symptoms, and physical examination was normal, one month later. Three patients obtained no relief from the injection of hydrocortisone acetate. Of the remaining four patients who obtained some relief, all were subsequently given placebo injections. In each instance, the placebo injection duplicated the result of the steroid. It is apparent, therefore, that with the

one exception of the patient with a traumatic arthritis superimposed on a minimal osteoarthritis of the hip, the beneficial effect of hydrocortisone acetate in chronic osteoarthritis of the hip joint is in doubt.

The results in sixteen patients with osteoarthritis of the knee joints are given in Table IV.

The total in Column 2 is 17 due to the fact that one patient had no benefit following the injection of 50 mg. hydrocortisone acetate into her left knee which was only mildly involved, while she experienced a grade 2 improvement following a similar injection into her right and more severely involved knee joint—although a previous injection of procaine into this same knee gave no relief. Of the eight patients who obtained a grade 3 or grade 4 improvement, all gave past histories of essentially asymptomatic or only mildly involved knee joints with more recent flares in knee pain as a result of excessive physical activity. A typical case history is as follows:

A male factory worker, sixty-seven years old, had had for the previous three years occasional episodes of mild aching in both knees, especially noticeable toward the end of his work days. One evening, following the shoveling of a 10-inch snowfall from his front walk, he experienced a marked increase of pain in the right knee. The next morning he went to work but after being on his feet for just one hour the pain had so increased that he had to be taken home. Physical examination that afternoon revealed moderate limitation in joint motion apparently due to muscle guarding, and slight medial joint tenderness. X-ray of the knee revealed extensive hypertrophic spurring and fairly marked medial narrowing of the joint space. The patient was placed at absolute bed-rest and the symptomatic use of heat, codeine, and aspirin were prescribed. On the fifth day, there was less pain at rest and passive motion of the knee was more free, but weight bearing still elicited severe pain. At this time 37.5 mg. hydrocortisone acetate was injected into the right knee joint. Ten hours later the patient was able to bear his full weight on the right knee without pain. The knee was normal on physical examination two days later. The patient returned to work on the third day and he has continued well except for the occasional return of the mild aches he had experienced in the past.

One of the patients who on two occasions obtained a grade 3 improvement from hydrocortisone lasting two to three weeks, was given an intra-articular injection of cortisone acetate. After a localized flare lasting twelve hours, he experienced a grade 2 relief which lasted ten days.

A striking fact emerged from the analysis of the data in the group of patients with osteoarthritis of the knee joints: the poor or minimal results were in those patients with a chronic and on the whole a relatively mild degree of disability, while the excellent results were, without exception, in patients who had acute or subacute flares superimposed on their chronic osteoarthritis. In most of these latter patients a definite traumatic event could be brought out from their histories, and the improvement usually was complete in patients who had no symptoms before their trauma, while those patients with chronic low grade symptoms usually were restored to their previous state of mild disability. This would appear to indicate that hydrocortisone acetate is of the greatest value in suppressing the acute inflammatory reactions of trauma rather than the minimal and gradual type of tissue reaction that is more characteristic of chronic osteoarthritis. The dramatic improvement reported in a few instances of acute traumatic joints in young individuals treated with hydrocortisone would appear to support this concept.[5]

Other Rheumatic Conditions

One patient with chronic gouty arthritis was given 37.5 mg. hydrocortisone acetate into the right knee joint. An improvement graded as 2 plus occurred within twelve hours and persisted for about two weeks when he began to experience improvement in the other knee and several additional involved joints as a result of the interim gout therapy. This generalized improvement has continued under the program of a low purine diet and salicylates.

One patient with septic arthritis of the knee, secondary to a severe staphylococcal cellulitis of the forearm, was treated with the intra-articular injection of hydrocortisone acetate. The injection was made during the convalescent period when there was no longer evidence of active knee joint infection, but while there was persistent severe pain which prohibited weight bearing and which interfered with the attempts of physical medicine to restore a normal range of motion. Within six hours after the injection of 50 mg. hydrocortisone acetate the knee was less painful and by twenty-four hours full weight bearing was possible. A grade 3 improvement which lasted for five days permitted the discharge of the patient from the hospital and the continuation of physical therapy as an out-patient. By ten days much of the knee pain returned but this was again relieved by a second injection of 50 mg. hydrocortisone.

Three patients with acute periarthritis or so-called "bursitis" of the shoulder were treated by the injection of 25, 30, and 37.5 mg. of hydrocortisone acetate respectively into the localized area of acute tenderness. One patient noticed about a 25 per cent improvement within twenty-four hours, and she then gradually recovered in two weeks. The other two patients received no help from the injection. One patient subsequently made a good response to x-ray treatment.

Summary and Conclusions

1. The injection of 37.5 to 50 mg. hydrocortisone acetate into the joints of twenty-three patients with rheumatoid arthritis produced a moderate to marked local improvement in symptoms and objective findings in 90 per cent of patients which lasted from one to two weeks.

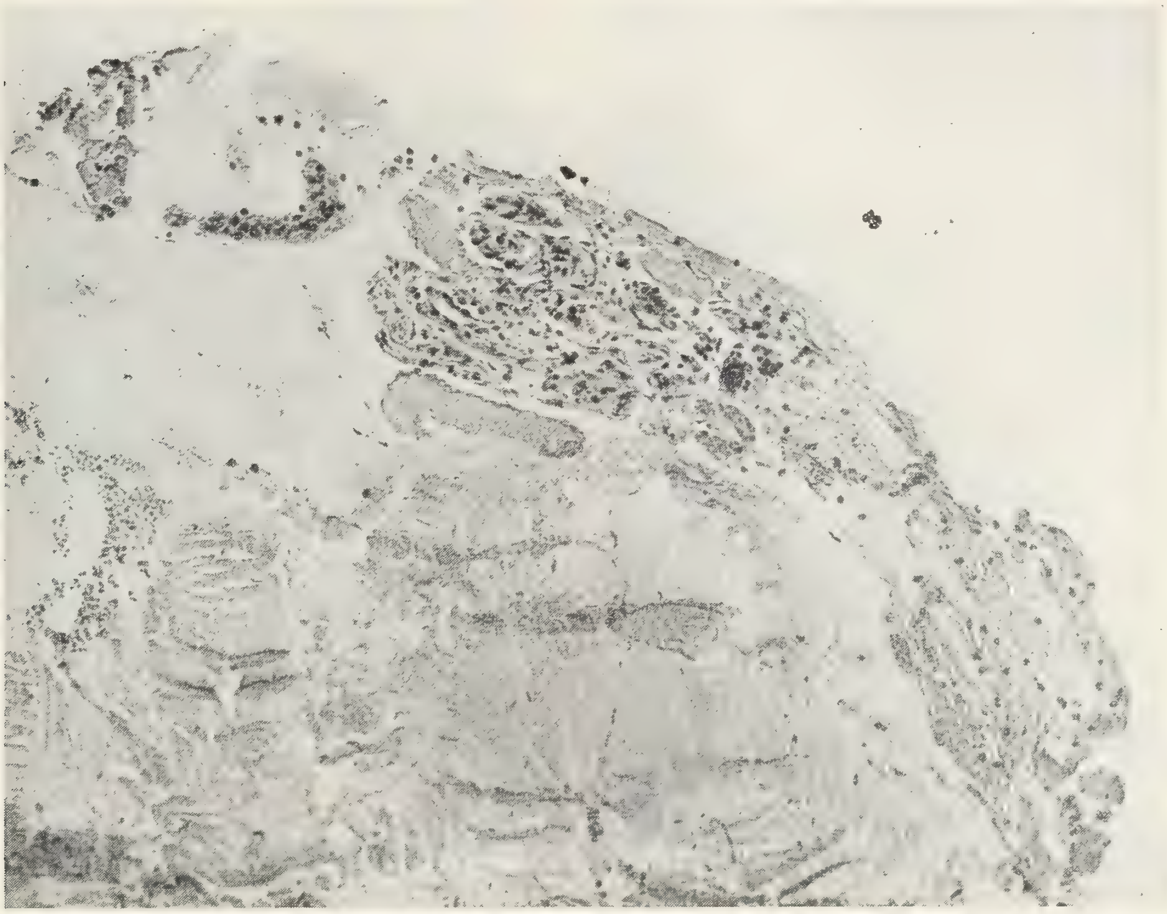

Fig. 3. Synovium, from the microscopic field showing the greatest cellular reaction, taken twenty-one days after starting weekly injections of 50 mg. hydrocortisone acetate.

2. Histologic study of the synovium in a small group of cases showed rather little comparative change in the local tissue reaction with the exception of one patient who was given weekly injections and who after three weeks showed definite evidence of microscopic "healing."

3. The injection of cortisone acetate in doses of 100 mg. into the joints of seven patients with rheumatoid arthritis produced an effect about half that of hydrocortisone. In addition, a temporary local irritation occurred in two patients.

4. In osteoarthritis of the hip joints there is much doubt as to the value of local injections of hydrocortisone. The importance of controlled studies is emphasized.

5. In osteoarthritis of the knees hydrocortisone acetate appears to be of little value in the average case of chronic, low grade activity. However, in patients who are experiencing acute or subacute flares in symptoms as a result of recent trauma, etc., the local injection of hydro-

(Continued on Page 968)

SEGMENTAL RESECTION IN THE TREATMENT OF INFLAMMATORY PULMONARY LESIONS

W. ROBERT SCHMIDT, M.D.
Minneapolis, Minnesota

IN 1939, Churchill and Belsey[5] demonstrated and reported segmental resection in the treatment of inflammatory lesions in the lung. Many surgeons were reluctant to employ segmental resection in preference to lobectomy because of higher incidence of postoperative complications that occurred with segmental resection. Many of the residual segments functioned improperly due to kinking or interference with the bronchi, and also due to interference with the blood supply of the small residual segments. Important refinements in the technique of segmental resection have been made by Overholt,[7] Claggett,[6] Blades,[1] Ramsey[8] and others, so that at the present time, great stress is laid upon the necessity for accurate, anatomical, intersegmental dissection of the segments. With present-day techniques, it is possible to completely excise the diseased segments with no distortion of the anatomy or impairment of the bronchial or blood supply to the adjacent segments. Improvements in the technique of operation, the wider range of antibiotic drugs available, increased knowledge of the intersegmental anatomy[2,6] and the increased familiarity with this operation have all led to a reduction in the morbidity following this operation, so that at present segmental resection can be carried out with as few major complications as lobectomy. The incidence of minor complications still remains somewhat higher with segmental resection than with lobectomy.

Segmental resection has certain advantages over lobectomy. It provides a method by which the diseased tissue can be excised with minimal interference with pulmonary function. This factor becomes of great importance when operating on patients with poor or reduced pulmonary reserve. There are many occasions in which the diseased pulmonary segments are not confined to one lobe, but are scattered throughout several lobes of both lungs. In such cases, segmental resection offers the only possible surgical approach which will allow complete eradication of all the diseased tissue.

Bronchiectasis will often be distributed in characteristic patterns. Rather commonly one sees involvement of the basilar segments of both lower lobes; the lingula of the left upper lobe and the right middle lobe. The superior segments of the lower lobes usually are uninvolved and have undergone marked enlargement and hypertrophy at the expense of the contracted diseased segments (Fig. 1). Segmental resection here affords a methods of excision of all diseased segments, with preservation of sufficient functioning pulmonary tissue to avoid severe respiratory crippling. It is essential that the bronchogram show all branches of the bronchial tree, as the surgeon cannot palpate the diseased segments at operation.

We have outlined a number of these small residual segments by attaching metal radio opaque markers to their margins during the operation. Postoperative chest x-rays demonstrate normal expansion. These segments obviously function very well as space-fillers. This fact alone would justify preserving small segments in order to prevent overexpansion of the adjacent lobes and thus improve the pulmonary function. There is good indirect evidence obtained by differential bronchiospirometry that these residual segments function normally as efficient respiratory organs.

Surgeons have been slow to utilize segmental resection for known tuberculous lesions. There has been a reluctance to dissect near caseous tuberculous foci for fear of producing tuberculous empyema and spread of the disease. Experience has shown that this violation of tuberculous tissue has, to date at least, not been productive of demonstrable harmful effects.[3,4] Segmental resection, combined with local excision, appears to be of great value in the eradication of multiple, scattered, bilateral, caseous, cavitary, tuberculous foci. (Figs. 2, 3 and 4).

Limited excision of tuberculous foci has been carried out in a number of patients who have

---

Read at the Annual Meeting of the Minnesota State Medical Association, Minneapolis, Minnesota, May 26, 1952.

residual caseous foci, in order to reduce the incidence of reactivation and spread that is known to occur in this group. (Figs. 5 and 6).

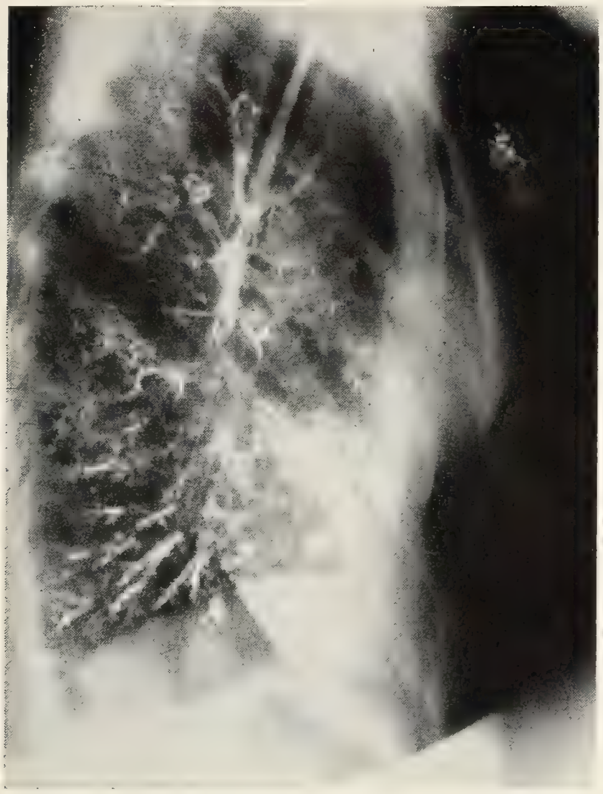

Fig. 1. Bronchogram of right lung showing Bronchiectatic basal segments with normal superior segment bronchi. Middle lobe bronchi are also involved. Note overexpansion of the superior segment of the right lower lobe.

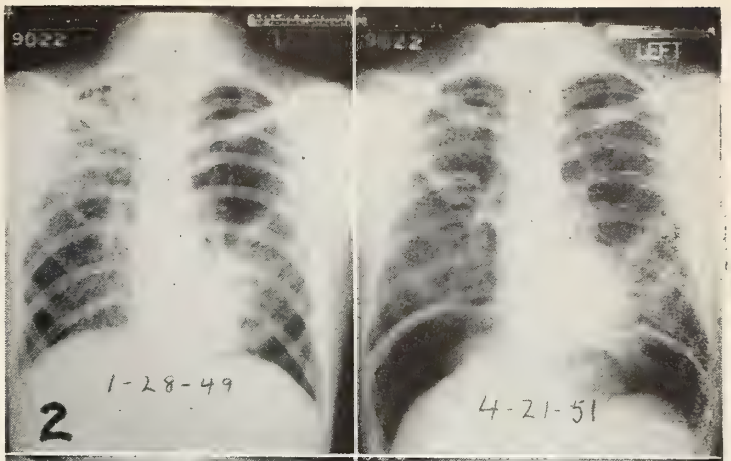
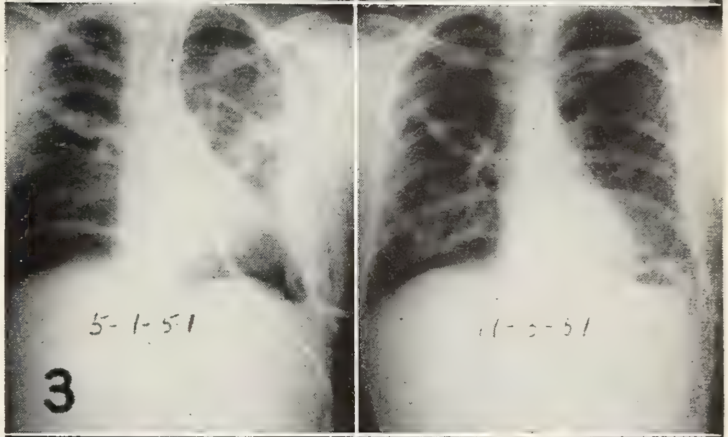
Finally, a third group has been subjected to localized or segmental resection of residual tuberculous lesions in preference to thorocoplasty, since resectional therapy will be more saving of pulmonary function, with a somewhat greater incidence of sputum conversion.

A summary of eighty-four resections on the author's service from March, 1951, to February, 1952, at Glen Lake Sanatorium reveals that fifty-eight primarily segmental resections were done in fifty-one patients. Of this group of fifty-one patients, thirty-one had bilateral involvement. One patient died as a result of cardiac arrest, giving a patient mortality rate of 1.9 per cent, and a mortality rate per operation of 1.7 per cent. Of the fifty survivors, four (8 per cent), had severe complications, consisting of one contralateral spread, one broncho-pleural fistula (now closed), one residual cavity in a patient who also developed uremia with convulsions as an exacerbation of pre-existing severe nephritis, and one who has a questionable recurrence at the site of the previous local excision.





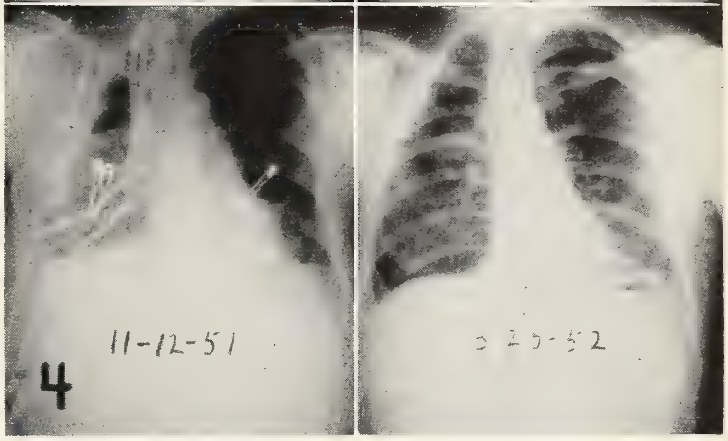


Fig. 2. L.G. *(left)* Admission film showing extensive bilateral tuberculosis with cavitation. *(Right)* Preoperative film twenty-seven months after admission. Had bedrest and pneumoperitoneum plus tibione.

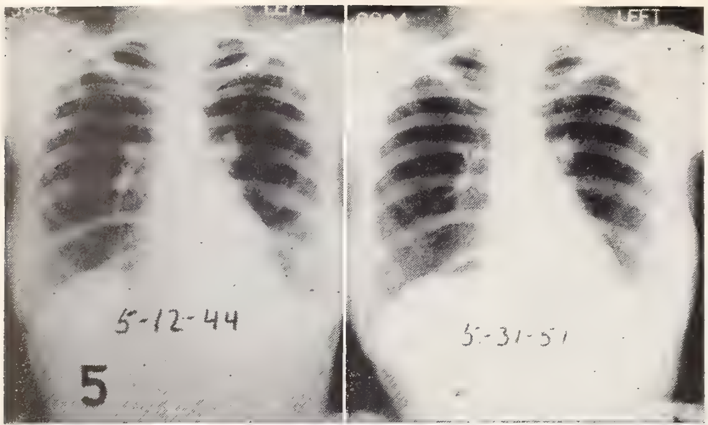
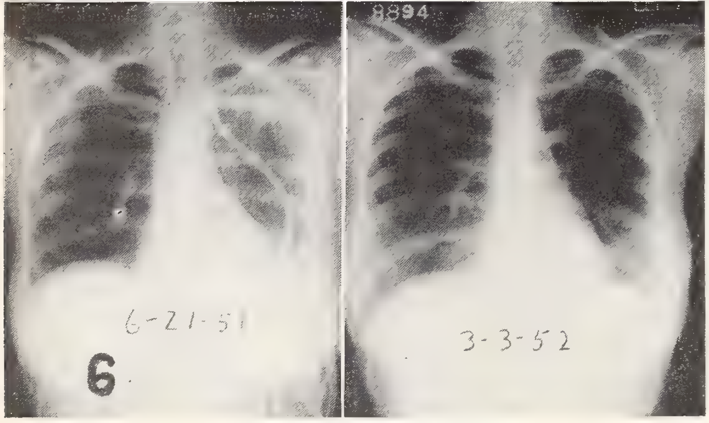
Fig. 3. L.G. *(left)* Immediate postoperative x-ray. Excision of nodules in left lower lobe and segmental resection lingula of left upper lobe. *(Right)* Film six months after first resection. Vital capacity 3,200 cc. The left lung contributes 50 per cent of vital capacity and has better oxygen uptake than the right.

Fig. 4. L.G. *(left)* Immediate postoperative x-ray after right upper lobe lobectomy, segmental resection of portion of right middle lobe, and excision of nodules in right lower lobe. *(Right)* X-ray after bilateral resection. He has had five gastric cultures since operation, all negative for tubercule bacilli.

Seven patients had minor complications consisting of residual air pockets which persisted for varying lengths of time. One of these patients had a small thorocoplasty done ten days after the resection; the remainder were treated expectantly



5



6

Fig. 5. P.H. *(left)* Note fibronodular disease in left upper lobe. This patient has had intermittantly positive sputum with activity since 1941, despite prolonged sanitarium care. *(Right)* Preoperative film showing residual fibronodular disease in left upper lobe. Gastric cultures positive for acid-fast bacilli.

Fig. 6. P.H. *(left)* Immediate postoperative x-ray after resection of segment of left upper lobe. *(Right)* Late postoperative film. Six gastric cultures have all been negative for tubercule bacilli.

or by aspiration with eventual obliteration of the pleural space.

A number of factors are present which make interpretation of the postoperative sputum status difficult. The period of follow-up is too short; many of the patients are awaiting surgery on the contralateral lung. Some have converted to negativity as a result of their medical management, especially with the use of streptomycin therapy prior to surgery, and are still on antibiotic therapy to control small residual foci.

Twenty-three patients have cultures running; one patient died. This leaves twenty-seven available for study at the present time. Of these twenty-seven, eighteen (66 per cent) have had negative sputum and gastric cultures; five (18 per cent) have had an occasional positive culture. Two (7.4 per cent) have positive cultures but are improved, and two (7.4 per cent) have positive cultures with x-ray evidence of active disease. These conversion rates compare favorably with the early studies of conversion rates following lobectomy.

POSTDOCTORAL FELLOWSHIPS AVAILABLE

The National Foundation for Infantile Paralysis announces the availability of a limited number of additional postdoctoral fellowships to candidates whose interests are research and teaching in medicine and the related biological and physical sciences. The purpose of these National Foundation fellowships is to increase the number of professional workers qualified to give leadership in the solution of basic and clinical research problems of poliomyelitis and other crippling diseases.

The fellowships cover a period of from one to five years. Stipends to Fellows range from $3,600-$7,000 a year, with marital and dependency status considered in determining individual awards. Institutions which accept Fellows receive additional compensation for expenses incurred in relation to their training programs.

Eligibility requirements include United States citizenship (or the declared intention of becoming a citizen), sound health and an M.D., Ph.D., or an equivalent degree.

Selection of candidates is made by a Fellowship Committee composed of leaders in the fields of research and professional education. The designation "Fellow of The National Foundation for Infantile Paralysis" will be given to successful candidates.

A total of 144 fellowship awards in these categories have been made by the National Foundation up to August 31, 1952.

Complete information concerning qualifications and applications may be obtained from: Division of Professional Education, The National Foundation for Infantile Paralysis, 120 Broadway, New York 5, New York.

AUREOMYCIN IN INFECTIONS OF THE URINARY TRACT

A Clinical and Bacteriologic Study

JAY R. LONGLEY, M.D.
and
GERSHOM J. THOMPSON, M.D.
Rochester, Minnesota

DURING the past five years the discovery and development of new antibiotic agents have been so rapid that a precise knowledge of their effectiveness and clinical applicability has sometimes failed to keep pace. Since 1946, when penicillin came into general use, streptomycin, aureomycin, chloramphenicol, terramycin, polymyxin and neomycin have swiftly appeared, each with its own special therapeutic value and unlimited prospects for the future.

One of the latest antibiotics, aureomycin, was first isolated by Duggar from the yellow pigment-producing mold Streptomyces aureofaciens in 1947 but was not described by him until 1948 when he reported his work before the New York Academy of Sciences.[2] His results from *in vitro* antibiotic studies suggested that aureomycin was effective against a multitude of organisms, some of which were pathogens of the urinary tract. By 1949, when our study began, little clinical evidence had been reported to corroborate these laboratory implications.

Purpose of Study

It was our desire to determine the sensitivity of a large variety of bacteria obtained from cultures of infected urine of patients, to treat as many of these patients as possible with aureomycin for a fixed time and to observe the clinical and bacteriologic results.

Methods and Materials

Examinations of the urine of 174 patients were made prior to treatment of infections of the urinary tract with aureomycin. A total of 187 separate cultures and sensitivity tests were performed before treatment, the larger number of cultures representing mixed infections in some of the patients. Of the 174 patients only fifty were carefully enough controlled to be included in this study as far as clinical response was concerned. Patients excluded were those who could not take oral medication, those who were treated with another antibiotic in conjunction with aureomycin and those who were dismissed without a follow-up culture or Gram stain, or both.

The urine was collected in sterile containers and transported immediately to the Section of Bacteriology. On receipt in the laboratory approximately 0.1 cc. of the urine was placed on the surface of an eosin-methylene blue plate and a blood-agar plate and incubated over night. In some instances the organisms obtained by culture were held over until aureomycin therapy had been completed in order that their susceptibility to aureomycin could be compared with that of organisms isolated after completion of therapy. Tests of sensitivity to aureomycin *in vitro* were carried out on freshly prepared blood-agar plates in which aureomycin was incorporated. A uniform inoculum of an eight-hour culture was spread evenly over the surface of a series of blood-agar plates containing twofold dilutions of aureomycin. The plates were incubated at 37° C. for seventeen hours and the sensitivity recorded was the concentration of aureomycin which would inhibit completely the growth of the organisms.

The degree of sensitivity to aureomycin was graded according to the amount of the drug necessary to inhibit growth, in the following manner: highly sensitive—growth inhibited by 1.56 micrograms or less per cubic centimeter; moderately sensitive—growth inhibited by 3.12 micrograms per cubic centimeter, and resistant—growth not inhibited by 6.25 micrograms per cubic centimeter or more. In some instances the sensitivity of the organisms was checked against concentrations of aureomycin as high as 500 micrograms per cubic centimeter.

Dosage of aureomycin, both total and daily, varied with the organism cultured from the urine,

---

The aureomycin used in this study was supplied by Lederle Laboratories Division, American Cyanamid Company, Pearl River, N. Y.

The laboratory work was carried out by the Section of Bacteriology.

Dr. Longley is a Fellow in Urology, Mayo Foundation, University of Minnesota and Dr. Thompson is with the Section of Urology, Mayo Clinic, Rochester, Minnesota.

TABLE I. ORGANISMS ISOLATED IN 187 CULTURES FROM 174 PATIENTS WITH INFECTION OF THE URINARY TRACT AND THE SENSITIVITY OF THESE ORGANISMS TO AUREOMYCIN IN VITRO

Organism	Total Cultures	Highly Sensitive	Moderately Sensitive	Resistant Number	Resistant Per cent
Escherichia coli	61	11	28	22	36
Aerobacter aerogenes	48	13	22	13	27
Proteus vulgaris	31	0	1	30	97
Micrococcus pyogenes	18	15	0	3	17
Pseudomonas aeruginosa	16	0	1	15	94
Streptococcus faecalis	12	11	1	0	0
Streptococcus viridans	1	0	1	0	0
Total	187	50	54	83	

TABLE II. ORGANISMS ISOLATED IN FIFTY-FOUR CULTURES FROM FIFTY PATIENTS WITH INFECTIONS OF THE URINARY TRACT AND THE PROPORTION NOT CONTROLLED BY TREATMENT WITH AUREOMYCIN

Organism	Total cultures	Not controlled bacteriologically Number	Not controlled bacteriologically Per cent
Aerobacter aerogenes	23	1	4
Escherichia coli	16	3*	19
Streptococcus faecalis	5	0	0
Proteus vulgaris	3	2	67
Pseudomonas aeruginosa	4	3	75
Micrococcus pyogenes	3	1	33
Total	54	10	19

*Two of these were sensitive and 1 was resistant to aureomycin *in vitro*.

its sensitivity, and the size of the patient; it was usually 1 gm. a day for four days. At first, post-therapy cultures were taken forty-eight hours after the administration of aureomycin had been stopped, in accordance with previous reports[1] that the lapse of approximately this much time is necessary to clear the urine of aureomycin. Later we discovered that in most instances the concentration of aureomycin in the urine had little effect if the cultures were made shortly after use of the drug was discontinued; dilution and instability of the drug no doubt contributed to these findings in cultures. Sensitivity was determined after treatment in a number of instances in which cultures were positive and the organism tested against higher concentrations of aureomycin.

Results and Comment

The variety of organisms isolated in our study and their sensitivity to aureomycin are indicated in Table I. Escherichia coli was the most common organism (33 per cent of the cases) and 64 per cent of these were sensitive *in vitro*. Aerobacter aerogenes was the second most common one (26 per cent of the cases) and 73 per cent were sensitive *in vitro*. Proteus vulgaris was found in 17 per cent of the series and all but one was considered resistant (97 per cent were resistant). Micrococcus pyogenes formed 10 per cent of the 187 cultures and 83 per cent were considered sensitive. Pseudomonas aeruginosa was present in 9 per cent of the cultures and all but one were resistant (94 per cent were resistant). Streptococcus faecalis was cultured eleven times (6 per cent of the cases) and all were sensitive. Streptococcus viridans was found on one occasion and it was sensitive.

Proteus and Pseudomonas were resistant to aureomycin at high concentrations *in vitro*. In two cases Proteus was inhibited by 500 micrograms per cubic centimeter; Pseudomonas was inhibited by 100 micrograms per cubic centimeter in two cases and by 500 micrograms per cubic centimeter in one case.

From Table I it may be seen that 104, or 56 per cent, of the 187 organisms were sensitive to aureomycin *in vitro* and, if the Pseudomonas and Proteus groups are excluded, 73 per cent of the other bacteria were sensitive to this antibiotic *in vitro*.

Table II summarizes the clinical results. Escherichia coli and Aerobacter aerogenes occurred frequently enough to give significant results. In these groups treatment failed in 19 per cent and 4 per cent, respectively, as compared to *in vitro* resistance in 36 per cent and 27 per cent, respectively. As is indicated by comparison of Table I and Table II, *in vitro* tests in this series were somewhat misleading as to therapeutic results to be expected. The difference may mean that our standards for resistance to these organisms may have been too low when one considers the high urinary levels of aureomycin attainable clinically[3] and that a certain percentage of the organisms that did respond but were "resistant" *in vitro* may have been inhibited in the next few stronger dilutions of aureomycin in the laboratory sensitivity tests.

In some of the cases of urinary infection the original organism was removed by treatment with aureomycin but another organism, usually Proteus or Pseudomonas, grew out in the culture when use of the drug was stopped. These were cases

THE HYPERTENSION PROBLEM

Recent Advances in Clinical Description and Management with Drugs

CARLETON B. CHAPMAN, M.D.

Associate Professor of Medicine
University of Minnesota Medical School
Minneapolis, Minnesota

ESSENTIAL hypertension has been recognized as a disease entity for over sixty years. During this period progress toward effective treatment has been painfully slow and the course of the disorder can only rarely be halted. It seems reasonable to believe that this situation will not always obtain and the profession should not fall by the wayside into the morass of therapeutic nihilism. On the other hand, it is high time a measure of reason was introduced into our outlook concerning the course of the untreated disease. In any case, progress toward an adequate description of the natural history of essential hypertension has, in recent years, been more impressive than progress in the treatment of the disorder.

We can, therefore, begin to cut this monster down to size. Since no effective depressor measure is, or is likely to become, free from inconvenience and possibly danger to the patient, it is clearly wrong to employ such agents unnecessarily. Likewise, it is fatuous to claim great success for therapeutic agents when they have been tested on patients who would do well even if left untreated. It all comes down, in the last analysis, to two questions: (1) What patients with essential hypertension should we treat? (2) What therapeutic method should we use in those patients who require treatment? In the latter connection, this presentation will deal only with some of the newer drugs, in view of the nature of our own experience and the limited time available.

Normal and Abnormal Blood Pressure

Every physician knows that many, and perhaps most, hypertensive patients go for many years without developing any of the dread sequelae of prolonged hypertension such as heart failure, cerebrovascular accidents, or uremia. He also knows that many of them are able to continue at their daily work, particularly if they can be persuaded to maintain a firm and unruffled attitude toward their disease. This is not to say that cardiac failure and cerebrovascular disease due to essential hypertension are particularly uncommon, but, relative to the number of patients we usually consider to be hypertensive, they are indeed infrequent or at least surprisingly slow to make their appearance.

TABLE I. INCIDENCE IN PER CENT OF HYPERTENSION BY SEX AND AGE.
Condensed from Master, Dublin, and Marks (1).

Sex—Age		140/90	150/90	150/100	180/105
Men	16-19	13.1	9.2	4.0	0.5
	35-39	29.1	23.3	9.5	1.5
	60-64	60.3	48.5	36.9	8.2
Women	16-19	5.3	4.0	1.4	0.2
	35-39	20.8	16.4	6.1	1.1
	60-64	64.4	51.8	40.8	13.1

One may well wonder, therefore, about our criteria for differentiating between normal and high levels of blood pressure. This question has recently been subjected to close scrutiny by Master and colleagues[4] who base their views on physical findings in about 75,000 adults. Consideration of their work shows that there can be no rigid definition of the normal blood pressure. They confirm the impression that although people in their teens and twenties normally have blood pressures that are well below the usually accepted 140/90, the levels in otherwise normal middle-aged and elderly people often exceed this value. If we try to define the incidence of so-called hypertension in people who are otherwise healthy, we must, of course, accept some rather arbitrary blood pressure level as separating the normal from the abnormal. Again using Master's data, we see clearly that the incidence depends entirely on our definition (Table I). If 140/90 is accepted as a dividing line, as custom often requires, relatively large numbers of people, especially in the older age groups, must be classified as abnormal. If we go to the other extreme and set 180/105 as the dividing line, the number so classified is much smaller. It seems likely, in the older groups at

---

These studies are being supported in part by a grant from the Minnesota Heart Association.

Minnesota Medical Foundation lecture delivered before the annual meeting of the Minnesota State Medical Association, Minneapolis, Minnesota, May 28, 1952.

least, that the 180/105 dividing line is more realistic than the 140/90 level. The blood pressure alone, therefore, turns out to be a rather unsatisfactory means of separating healthy from unhealthy individuals. Standard statistical assumptions show that a certain number of normal persons have blood pressure levels that are well above or below the average figure for the group. On this basis, Master and colleagues have calculated lower and upper limits of normal for persons of various ages. Above and below these limits are borderline areas and blood pressure readings that fall within them may or may not indicate the presence of disease. There is no way of knowing how accurate these limits really are, but the data strongly suggest that many individuals are wrongly classified as abnormal on the basis of the blood pressure alone. The work also shows how very badly we need some measurement *other than* the blood pressure to help us separate those individuals who usually show somewhat elevated blood pressures but who have no actual disease from those who, with comparable blood pressures, actually have early essential hypertension. In any case, a single abnormal measurement of the blood pressure is rarely sufficient evidence on which to base the diagnosis of essential hypertension. In a study conducted by Dr. Ancel Keys and co-workers at the University of Minnesota, 283 middle-aged men have been carefully examined every year for five years. Thirty-five and seven-tenths per cent of the group showed systolic blood pressure readings of 140 mm. Hg or above, and/or diastolic readings of 90 mm. or over *at least once* during the five years. But only 10 per cent of the group consistently showed readings at or above this level. Should the 25 per cent who do not *consistently* show levels of 140 systolic and/or 90 diastolic be called hypertensive and should treatment be instituted? In the absence of other evidence of disease, the burden of proof is surely on the man who answers these questions in the affirmative. Even if, as the study proceeds, they do indeed prove to have essential hypertension, the question of treatment is still a moot one.

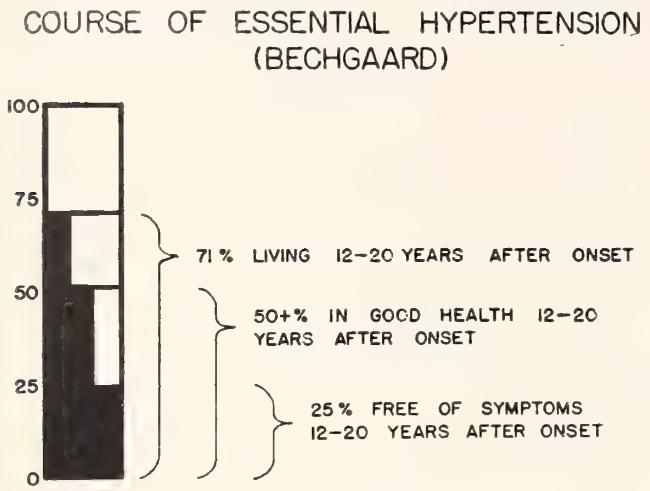

Fig. 1. The course of essential hypertension in 1,002 patients followed by Bechgaard[1] for seven to eleven years.

Natural History of Untreated Essential Hypertension

It is difficult to be certain that any method of treating essential hypertension actually alters its course. Until recently, documentary evidence to show the course of the untreated disease has been lacking. Without this knowledge, it has been impossible to gauge the long-term effect of treatment of any kind. The information now at hand puts us on firmer ground. Two large studies, one by Bechgaard,[1] and the other by Frant and Groen,[2] are in good agreement. They show that essential hypertension, *considered generally,* is indeed a benign disease. We should note, however, that no single patient is really described by an average figure and that each needs careful individual evaluation, preferably over considerable periods of time. Bechgaard's large study shows that about 71 per cent of patients with essential hypertension survive at least twelve to twenty years after onset and that over half of them remain in good health for such a period (Fig. 1). By good health he means that over half of his patients continued at productive employment or were able to lead relatively normal lives. Only 25 per cent of the group, however, remained asymptomatic for this length of time and the fact deserves comment. Symptoms in essential hypertension may or may not be directly due to the fact that the blood pressure is elevated. Some of them are definite enough. Dyspnea on exertion and complaints relative to cerebrovascular accidents—actually symptoms of sequelae of hypertension and not of elevated blood pressure itself—are unmistakable and usually can easily be separated from subjective complaints. But what of the headache, nervousness, and fatigibility that are so frequently non-specific symptoms, possibly of iatrogenic disease and may well represent anxiety symptoms rather than direct symptoms of hypertension itself? It we had some way of distinguishing clearly between organic and nonorganic symptoms in patients with essential hypertension, it seems safe to assume that far more than 25 per cent of Bechgaard's cases would have been put in the asymptomatic category.

These generalizations apply to essential hypertension *en masse.* They are well supported by reliable data but leave out all consideration of age-sex factors. For this reason, they are somewhat misleading. Looked at more analytically, the data show clearly that established essential hypertension is a serious disease in young people and especially in young men, not so serious in middle-aged people of both sexes, and a mere annoyance in the elderly. More specifically, according to Bechgaard, a man who develops definite essential hypertension between the ages of thirty and forty-nine is eight times more likely to die within ten years of onset than is a comparable normotensive man over the same period of time. Women, in contrast, who develop the disease between thirty and forty-nine are only 1.4 times more likely to die during such a period of time than are comparable normotensive women. Men and women who develop the disease between the ages of fifty and sixty-nine have an excellent chance of living out a normal life span and attempts to treat the disease in this age group, except in unusual cases, are often ill-advised. These data suggest that overtreatment may have been the rule rather than the exception in the management of many cases of essential hypertension but they underscore the urgent need for effective therapy of the disorder, particularly when it occurs in young people and especially in young men.

Treatment of Essential Hypertension with Drugs

A clinically feasible method of controlling essential hypertension with drugs is not available. There are, however, many drugs which cause lowering of the blood pressure, almost all of which have, at one time or another, been recommended in the treatment of the disorder. The profession has quite rightly developed a rather critical attitude toward new depressor agents since so many have come and gone without contributing much to the year-to-year management of hypertensive patients. Depressor drugs do not, of course, strike at the cause of essential hypertension but, theoretically at least, if a prolonged depressor effect could be achieved, many of the worst sequelae of the disorder would be avoided or postponed. Toward this goal three groups of drugs are currently under investigation: (1) adrenergic blocking agents, (2) drugs acting centrally or centrally and peripherally, and (3) ganglionic blocking agents.

RELATIVELY NON-TOXIC

TOLERANCE DEVELOPS AT VARIABLE RATE

Fig. 2. The chemical structure and pharmacologic characteristics of 1-hydrazino-phthalazine.

Adrenergic blocking agents, also known as sympatholytic drugs, are thought to abolish or modify arteriolar constriction by direct action on the vascular wall or on the nerve endings in it. Several such drugs, including dibenamine and dibenzyline (688-A) have been tried in the treatment of essential hypertension with as yet inconclusive results. We have had no experience with them.

L-hydrazino-phthalazine, a drug thought to act centrally and known to produce renal hyperemia in the human being, has recently been introduced in the management of essential hypertension (Fig. 2). It has been found by Schroeder[6] to exert a mild depressor effect in patients with benign essential hypertension and a more marked depressor effect in patients with the malignant phase of the disorder. The drug appears to be relatively non-toxic and its effect is said to be enhanced by previous lumbodorsal sympathectomy. Tolerance to the drug probably develops over a variable period of time and it has not yet been shown to be effective in controlling essential hypertension over long periods. In our own hands, the drug has produced a moderate decrease of blood pressure in patients with severe essential hypertension but it has not been possible to maintain the effect more than a few weeks. Schroeder[6] reports probable benefit extending over many months. At best, however, the drug temporarily moderates the course of essential hypertension and, as pointed out by the above author, rarely restores the blood pressure to normal levels for any length of time. The drug, although commercially available, has not had adequate clinical testing and its place in the management of essential hypertension is still uncertain.

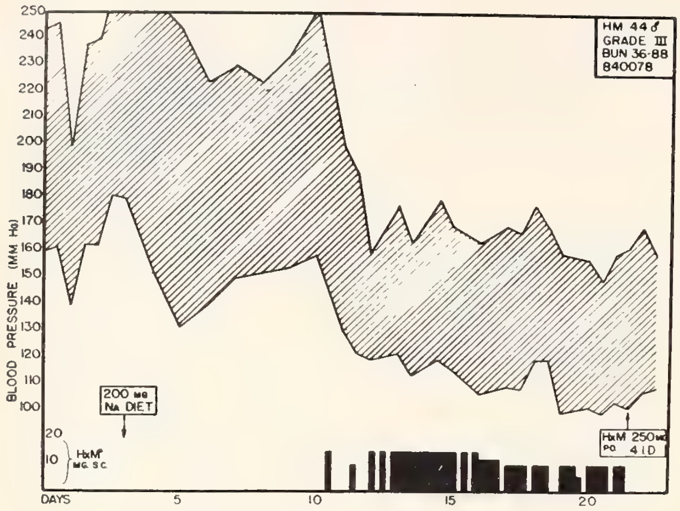

Fig. 3. Depressor effect of parenteral hexamethonium in a patient with severe essential hypertension.

Ganglionic blocking agents have recently attracted considerable attention. The first drug of this type to be investigated (tetraethylammonium) proved to have a very brief depressor action and for this reason was impractical as a means of controlling essential hypertension. More recently, longer acting drugs of this type have become available in the forms of penta- and hexamethonium salts.[5] When administered parenterally, the hexamethonium form produces a moderate to extreme depressor effect lasting up to about two hours. Although caution must attend its use, it is relatively non-toxic and can be used over long periods of time. Unfortunately, tolerance to the depressor effect of the drug is rapidly developed.

Studies on the effect of parenteral hexamethonium have been in progress at the University Hospital for about a year. Patients with severe, symptomatic essential hypertension have been used as test subjects. An initial 15 mg. dose of the drug is given intramuscularly and its effect on the supine blood pressure is carefully followed. If there is no effect, doses are increased by 15 mg. at three hourly intervals until a satisfactory response is obtained. This dose is then continued at three to six-hour intervals. The largest single dose determined in this way was 100 mg. After several days, it is usually necessary to increase the dose still further in order to maintain a satisfactory depressor effect and after seven to ten days it becomes impossible, in most cases, to maintain a satisfactory depressor effect without, at the same time, producing marked side-effects.

In one group of twelve severely hypertensive patients treated in this manner, definite lowering of the blood pressure was maintained for an average of 8.4 days. The relief of symptoms, especially of headache, was striking. The average fall in systolic pressure over the period was 48 mm.Hg. and was 27 mm. in the diastolic. Only three of the patients, however, showed more than momentary falls to normal (below 140/90) during the period of treatment. The fall in pressure in one patient is shown graphically in Figure 3.

Attempts to control the blood pressure in severely hypertensive patients over longer periods of time with parenteral hexamethonium have been disappointing. Three of the twelve were taught to give their own injections two or three times daily and were followed at weekly intervals in the clinic for two to three months. Although the remission in symptoms continued, the blood pressure levels returned to, or nearly to, the pretreatment levels. It was not possible, for various reasons to continue the parenteral treatment after discharge from the hospital in the remaining nine patients. Seven patients, however, were treated while in the hospital with parenteral (intramuscular) hexamethonium and then were treated with an oral form of the drug. As with the parenteral drug, the dosage of the oral preparation varies a great deal from patient to patient. It runs about ten times the parenteral dose and, in some patients, we have used up to 3 grams of it a day. The average control blood pressure in the group was 211/132. Treatment with parenteral hexamethonium reduced the average to 170/111. Subsequently, treatment with oral hexamethonium for two to ten weeks resulted in an average blood pressure reading of 189/114 for the group. We infer from our experience that the parenteral form of the drug is more effective and more predictable than the oral form but that the latter is not totally devoid of depressor effect (Fig. 4).

It should be noted that the above figures are averages that cover the entire period of a given type of treatment. This method of expressing results conceals the fact that most hypertensive patients show a maximum depressor response to hexamethonium soon after treatment is begun. Subsequently, although doses are steadily increased, blood pressure levels tend to rise presumably owing to the development of tolerance to the drug. To describe results in terms of *maximum* depressor response, however, is clearly misleading although it makes the results seem much more striking; day-to-day therapeutic results are of little significance in the lives of patients suffering from a disorder that characteristically lasts for years.

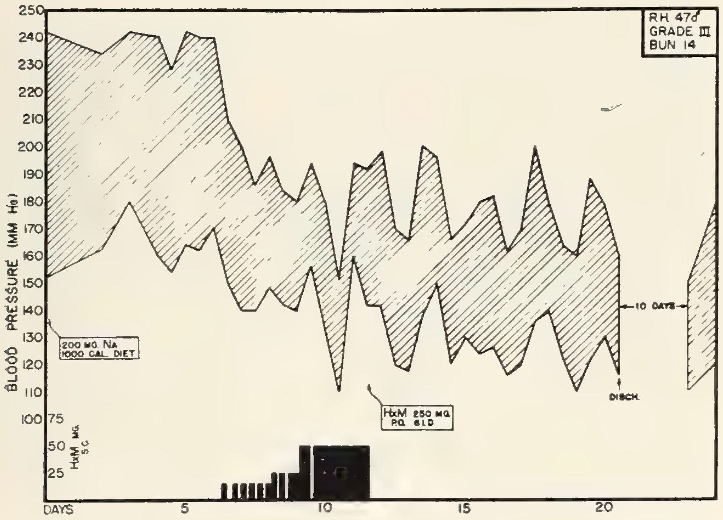

Fig. 4. Effect of parenteral, followed by oral, hexamethonium in a patient with severe essential hypertension.

In six patients with malignant hypertension, as evidenced by grade IV eyegrounds, there was moderate to marked decline in blood pressure after institution of treatment with parenteral hexamethonium. In all six, papilledema disappeared and in several there was recognizable diminution in retinal vascular constriction. As in the non-malignant group, relief of symptoms was striking. Temporary benefit was thus obtained in all six patients but the evidence does not yet suggest that use of hexamethonium significantly altered the course of the disease. One young man, with very fulminating malignant hypertension, showed a very satisfactory depressor response to the drug but the BUN continued to rise and the patient expired three days after treatment was begun (Fig. 5). Another patient in the group improved temporarily but died after adrenalectomy was performed. The remaining four patients are still living and show grade III eyegrounds. All still have marked hypertension but have temporarily weathered a malignant crisis, possibly owing to treatment with hexamethonium. Other types of hypertensive crises have been treated with the drug with some success. One patient, an eight-year-old boy, probably suffering from some type of renal hypertension, developed hypertensive encephalopathy with convulsions. Hexamethonium promptly lowered the blood pressure and terminated the convulsions but, probably because of the development of tolerance, the pressure rose again during the next few days. Subsequently, various combinations of drugs and diets brought the patient under fair control but maintenance has been difficult and he is now about where he started. It seems to us that, as matters now stand, the hexamethonium compounds are undeniably useful in the management of hypertensive crises but that some modification of them will have to be made before they can be adequately evaluated in the long-term treatment of essential hypertension.

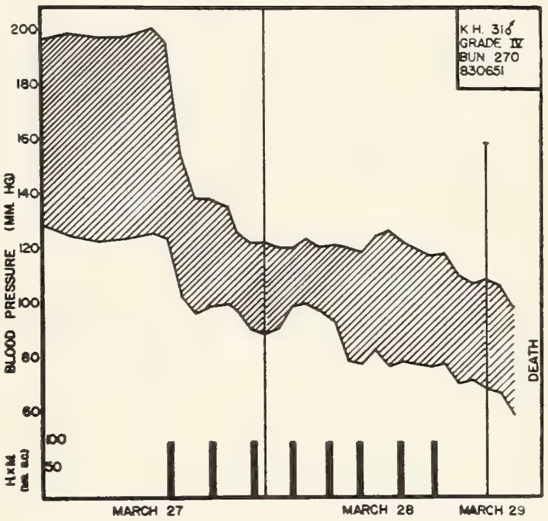

Fig. 5. Depressor effect of parenteral hexamethonium in a patient with malignant hypertension and progressive uremia.

The use of 1-hydrazino-phthalazine in combination with hexamethonium has recently received considerable attention.[3] The most valid reason for using hexamethonium and 1-hydrazino-phthalazine in combination is that such use delays the development of tolerance to their depressor effects. By giving the drugs in alternate doses, it is possible to maintain a fairly constant effect without giving either drug so frequently that rapid tolerance develops. Our own experience with the combination is too small to permit firm conclusions. The combination, when applied to five patients in the hospital, had a depressor effect that was comparable to that observed when hexamethonium alone was used. The combination has failed, in our hands, to maintain a significant depressor effect after patients were discharged from the hospital to be followed in the clinic. We have not attempted to instruct the patient or a member of his family to take the blood pressure and to adjust the dose of the drug accordingly. The technique seems to us to be ill-advised in view of the probable unreliability of the sphygomamometric readings. In addition, there is good reason to question the wisdom of directing the patient's attention so constantly to the level of his blood pressure. In any case, there is no satisfactory proof that hexamethonium alone or in combination with 1-hydrazino-phthalazine can effectively control essential hypertension on a year-to-year basis.

It is, therefore, still out of the question to speak of curing essential hypertension by means of drugs and the prospect for a convenient, easy way of controlling it by the use of drugs over long periods of time is not particularly bright. On the other hand, it is not unreasonable to expect that the newer depressor drugs can be improved, that more effective dosage schedules can be worked out, and that the development of tolerance to the effects of the drugs can be overcome to some extent. With the prospect of having several safe and effective depressor drugs at hand, and with the knowledge that depressor dietary measures can be safely applied for limited periods of time, effective long-term treatment of the disease may well become a reality. We may, in this way, be able to retard the development of the cardiovascular, and possibly the renal sequelae, for very considerable periods of time. But the basic disorder underlying essential hypertension, whether it be physiologic, biochemical, psychiatric, or all three, still escapes us.

In conclusion, we can answer the two questions posed initially only partly:

1. Attempts to treat essential hypertension by means of drugs should be limited to patients with severe, or rapidly progressing, forms of the disorder. An aggressive therapeutic attitude, however, should be adopted in dealing with well-established essential hypertension in the younger age groups and especially in young men.

2. Safe and practical methods of controlling hypertensive crises by the use of drugs are available. The long-term management of essential hypertension with drugs is not yet established as therapeutic fact.

Acknowledgments

Supplies of hexamethonium dibromide (Vegolysin) were at first provided by courtesy of Dr. R. D. H. Maxwell of May and Baker, Ltd., Glasgow, Scotland. Subsequently, oral and parenteral (Bistrium) forms of the drug were supplied by Mr. L. D. Foster and Dr. A. D. Console of E. R. Squibb and Sons, New York. A continuing and generous supply of hexamethonium bromide for oral use is being provided by Dr. G. E. Farrar of Wyeth, Inc., Philadelphia.

"ERADICATION" URGED

Representatives of all organizations interested in brucellosis in fourteen states met in Saint Paul in July, 1952, and launched a unified and determined campaign for eradicating this disease in cattle. The point was stressed throughout the discussions that only by eradicating brucellosis in animals can it be kept from infecting human beings.

Formation of statewide brucellosis committees in each state was recommended. It was agreed that all available means should be used to wipe out brucellosis—ring-testing of milk, blood-testing of animals in herds shown by the milk test to be suspect, calfhood vaccination where indicated, identification and ultimate elimination of reactors, quarantine of infected herds, and restrictions on the movement and sale of infected or untested animals.

The opinion was voiced at the meetings that Minnesota is outstanding in the degree of co-operation existing among various agencies working for the eradication of brucellosis. Other states represented at the conference were Illinois, Indiana, Iowa, Kansas, Kentucky, Michigan, Missouri, Montana, Nebraska, North Dakota, Ohio, South Dakota, and Wisconsin. Participating in the discussions were representatives of dairy, beef cattle, and swine raising groups; agricultural and farm extension organizations; veterinarians, animal disease control groups, health and medical groups, and the agricultural press, from both state and national levels.

Ralph L. West, D.V.M., secretary and executive officer of the Minnesota State Live Stock Sanitary Board, served as chairman. He was empowered to call the group together again when the need arises. A full report of the proceedings is being prepared and will be sent to each of the participants.—*Minnesota's Health.*

NASAL HEMORRHAGE

G. L. LOOMIS, M.D.
Winona, Minnesota

A VERY frequent condition which the general practitioner and specialist alike are repeatedly called upon to treat is that of nasal hemorrhage. Often occurring at night, it probably takes care of itself more times than we realize, but those cases which the physician sees usually require some kind of treatment. As we will see later, it is coming to be more and more a geriatric problem.

A review of nasal anatomy, while seemingly elementary, is worthwhile in considering the treatment in severe and resistant cases.[1,4] The numerous venous plexuses and arterial anastomoses present in the nasal region have been demonstrated by Batson in his dissections. The arteries of the nose come from the branches of the internal and external carotid. The anterior ethmoidal artery is a branch of the ophthalmic artery which supplies the area of the anterior-superior portion of the nasal cavity. From the external carotid, the septal branch of the labial artery, which is a twig from the external maxillary, supplies the extreme anterior end of the nasal septum. The alveolar branches of the internal maxillary supply the mucosa of the maxillary sinus, while a pharyngeal branch, also from the internal maxillary, supplies the mucosa of the sphenoids. The descending palatine branch of the internal maxillary passes through the palate into the incisive foramen and anastomoses with the sphenopalatine, which is the most important branch of the internal maxillary. The sphenopalatine enters the nose through the sphenopalatine foramen near the posterior end of the middle turbinate. The medial branch enters the septum and the lateral branch the turbinates, maxillary and ethmoid sinuses. The veins are very numerous and follow the arterial blood supply closely.

There are many causes of nasal bleeding. Trauma, self-induced, accidental or surgical, is a frequent cause. Surgical trauma occurs after intranasal operations or adenoidectomy. Arteriosclerotic vessels in older persons commonly bleed at night spontaneously and often require medical attention. Hallberg states that over 40 per cent of patients requiring hospitalization for epistaxis have hypertension, arteriosclerosis or both. They have an irritating tendency at times to stop before the physician arrives or soon afterwards, only to begin again the next night, and soon your patient is exhausted and your patience likewise.

Blood dyscrasias and neoplasms may cause spontaneous bleeding requiring surgical intervention. Also seen are hemorrhages from acute infectious diseases of the nose, foreign bodies in the nose, violent exertion, high altitude, septal ulcers, chemical intoxication such as mercurial and phosphorous poisoning, angiomas or malignant growths of the nose, vicarious menstruation, and many contitutional diseases such as hemophilia, purpura, leukemia, syphilis, tuberculosis, certain iron-deficiency anemias, vitamin C deficiency and hypertension.

The site of the bleeding naturally determines the ease of the treatment. By far the most common source is the anterior inferior portion of the septum known as Kiesselbach's area. There is a rich venous plexus here that bleeds easily from trauma, nose picking or dislodging crusts. Farther back on the septum bleeding may occur also but, if visible, still does not present too difficult a problem. Bleeding from trauma may be so generalized and profuse and the parts so edematous as to make actual control by direct vision impossible. A deviated septum may also cause difficulty in exactly locating the hemorrhage and may even require submucous resection.

Bleeding in the posterior nasal area is usually impossible to visualize and presents a more difficult problem. The blood usually drains into the pharynx and can often be seen dripping rapidly off the tip of the uvula. A long dependent clot may hang down in the hypopharynx, and no bleeding be seen at all. On removal of the clot, bleeding will often begin again and be seen coming down from above. Sometimes the first evidence of renewed bleeding is pallor, sweating, cold skin, rapid pulse and sudden emesis of blood.

Control of nasal hemorrhage can be very simple or extremely complicated, depending on location and severity. Methods and materials used to control it are almost numberless and run from simple pressure to packing the nasal cavity with various

---

Read at the annual meeting of the Minnesota State Medical Association, Minneapolis, Minnesota, May 27, 1952.

agents soaked in various solutions. Often used are vasoconstrictors, chemical agents such as silver nitrate, phenol, trichloracetic acid, chromic acid, Monsel's solution, tannic acid, salt pork, peroxide, vinegar, rubber balloons, Simpson splints, and so on, endlessly. More recently hemostatics of oxidized cellulose gauze or cotton have been found to be of considerable help.

Application of these methods varies with the case. Hemorrhage in children or adults with simple bleeding from Kiesselbach's area, if treated at home, can be controlled usually by pressure from a plug of either plain gauze or cotton in the nares. An easy method of control without using a pack is touching the bleeding point, if visible, with a chromic acid bead which one can easily make in the home. Similarly a local application of a mixture of equal parts of cocaine, phenol and menthol (Bonain's solution, used for anesthetizing the tympanic membrane) gives another use for this old remedy. In the office one can under good illumination use the actual cautery on these anterior bleeders. Injection of procaine and adrenalin solution or sclerosing solutions can help to stem the bleeding long enough to see what is going on and to better apply the actual cautery.

For inaccessible bleeding posteriorly which does not yield quickly to simple methods, it is better to put in a post-nasal tampon of adequate size and then pack the nares with vaseline gauze. Nasal packing should start at the most superior-posterior point, working forward and downward to the floor of the nose. In this type of case, bleeding will usually recur again and again and give the physician very litle rest if the packing is delayed in the hope that it may be avoided. Nothing is more exasperating than to be called back in the middle of the night after apparently successfully stopping the bleeding several hours previously.

If an absorbable gauze packing is used, it should not be packed tightly because of the danger of producing a pressure necrosis of nasal mucosa. A post-nasal pack should be removed in forty-eight hours, according to many authorities, to avoid otitis media. Spar and Hallberg[5] reported seeing blood in the middle ear in eight cases, and reported a case of osteomyelitis of the sphenoid with meningitis and cranial nerve palsy as another complication. The odor of putrefaction exuding from a patient with this packing in place very long is not pleasant, however, and can be partially prevented by impregnating the pack with antibiotic powders or ointments to keep down bacterial growth. One should also give penicillin parenterally.

After removal of the packing in the nasopharynx, bleeding may seem to be controlled, only to have it start up again either spontaneously or induced by coughing, sneezing, or straining. Patients in shock brought on by loss of blood should be treated supportively along with the attempt to control hemorrhage.

If in spite of all these measures one still fails to control the hemorrhage by conventional methods, ligation of major vessels becomes necessary. The decision to perform such a procedure may be reached in a few days or a week, depending on the condition of the patient. When one sees the bleeding becoming intractable, it is better to go ahead and ligate while the patient is in fairly good condition. The nervous agitation of the patient, his family and friends and the physician's fatigue make it almost mandatory. Dashing to the hospital five or six times in twenty-four hours will weigh heavily on one's nerves. There is no point in waiting until the patient becomes so weak that he is in a state of deep shock. Hallberg[2] mentions that of 106 patients admitted to the Mayo Clinic from 1930 to 1947 for severe epistaxis, there were eleven that required ligation of the external carotid artery. One-half were fifty-five years of age or more, of which 40 per cent had hypertension, arteriosclerosis, or both.

The previously mentioned anatomical blood supply will govern the choice of vessel for ligation. Obviously most bleeding will yield to external carotid ligation, but if the anterior or posterior ethmoidals are involved, the internal carotid or even the common must be tied off. The exact surgical technique will not be described here. It can be obtained in any standard text for those who are attempting it the first time. Hirsch,[3] Sewall and others had several cases where the internal maxillary artery itself was tied off by going through the antrum as in a Caldwell-Luc operation and continuing on through the posterior wall of the antrum where the internal maxillary artery is located in the soft tissue of the pterygopalatine fossa. Bleeding stopped immediately on ligation. Here the difficulty is that it is primarily a procedure for the rhinologist and the work must be done through a very small opening with special instruments.

Two cases which required ligation of the external carotid artery when all else had failed will be mentioned.

The first is that of A. P., aged thirty-five, a fireman by occupation, who was first seen on January 29, 1938. He had been cranking his car violently one cold evening when bleeding began spontaneously. He was sent to a hospital and a post-nasal pack inserted. Bleeding still took place through the pack, and it was removed and reinserted several times in the next two days. It would hold for a while and the pressure would tend to increase and the blood would filter through the pack. The condition of the patient became critical with the hemoglobin down to 55 per cent, the red cell count 3,000,000. The first transfusion was given January 31. His condition improved, but on the evening of February 1 about 1,000 cc. of blood were lost in a short time. At this time, on looking in the nasopharynx a spurter was seen high up in this area but nothing could be done to control it. It was decided after consultation to ligate the left external carotid artery. This was done February 3 with immediate cessation of bleeding. The patient rapidly improved and was discharged from the hospital February 10. There were no sequelae to the operation and no further bleeding occurred. In January, 1951, I performed a submucous resection of the nasal septum for difficult breathing and no untoward bleeding was encountered.

The second case was that of a stockyards worker who was injured by a cow on March 20, 1947. He had been bleeding for seven days when he was first seen. He was first treated by packing and post-nasal packing inasmuch as no bleeding point was seen. The patient continued to bleed and was hospitalized March 31.

In spite of constant packing and repacking along with three transfusions there was no let-up in hemorrhage. On April 3 the blood picture was: hemoglobin 60 per cent, red cell count 3,340,000. A decision was made to ligate the left external carotid which was done April 3. The same results took place as in the preceding case and convalescence was uneventful.

Summary and Conclusions

Nasal hemorrhage can be a very simple condition or one that requires heroic efforts to prevent death. Individuals with serious protracted bleeding should be sent to a hospital and an immediate attempt made to control the loss of blood. While rarely necessary, intractable bleeding calls for ligation of major vessels as a life-saving measure.

BLOOD TRANSFUSIONS AND EXPANDERS OF BLOOD VOLUME

THOMAS H. SELDON, M.D.
Rochester, Minnesota

THE present widespread dissemination of medical information to many individuals has led to considerable knowledge of the therapeutic value of blood, blood components and expanders of the blood volume, or so-called plasma substitutes.

Under average normal conditions, most communities have available either whole blood or one of the components of blood. However, these are not normal times, and the available supply of whole blood or one of the components might be inadequate if the demand were suddenly increased by a disaster or a series of disasters occurring locally or in the state as a whole. Minnesota is a valuable and vulnerable target. Consequently, it behooves the physicians in this state to be more than superficially familiar with the indications for the use of whole blood, the component parts of blood, and the various expanders of blood volume that are available commercially.

It will be of interest to all that the Committee on First Aid and Red Cross of the Minnesota State Medical Association passed a resolution on June 2, 1951, advocating the accumulation for use in event of civilian disaster of supplies of dextran, polyvinylpyrrolidone, gelatin or equivalent substances. This resolution was forwarded to Dr. A. J. Chesley, Executive Officer, Minnesota Department of Health, on June 23, 1951.[2]

Indications for Use of Blood and Blood Substitutes

For simplicity, the indications for the use of these therapeutic agents may be placed in one of five categories.

1. To Increase the Volume of Circulating Blood.—Reduction in the volume of circulating blood may result from operative or traumatic shock or from sudden massive hemorrhages of various types. The maintenance of proper blood volume depends to a large degree on an adequate reserve of tissue fluids. Patients who have lost much fluid, as in prolonged vomiting or diarrhea, pass more easily into a state of shock than do those whose fluid balance is adequate. Therefore, the correction of a state of dehydration, anemia or hypoprotinemia is of real import. The best treatment for shock is prevention. The reduction in blood volume itself, and not the loss of erythrocytes, is the prime cause of death in such cases.

In the active treatment of shock, immediate restoration of the blood volume is of great importance. In this way, the life of the patient may be saved. If the reduction in blood volume is left untreated, shock may become irreversible.

Most authors agree that in either prophylaxis or active treatment of shock, nothing seems to have as good and as lasting an effect as does the transfusion of whole blood. If more than a third of the blood volume is lost during an acute hemorrhage, death usually results unless the fluid volume is replaced quickly. When hemorrhage is slow, the loss of two thirds of the blood volume may be withstood because of peripheral vasoconstriction and the pouring of intracellular fluid into the vascular system.

It is the general consensus that administration of whole blood is preferred for the treatment of reduced blood volume caused by loss of blood. However, under conditions that might develop at any time, it may be that our supply of blood would be insufficient or unavailable. In such conditions, resort should be made to the use of one of the components of blood or one of the so-called blood volume expanders. Several of the latter agents are available, namely, acacia, gelatin, pectin, periston and dextran.

The use of acacia is decreasing. It may be found in the liver and other organs weeks or even years after administration, and it may produce allergic or anaphylactoid reactions in the recipient.

Solutions of gelatin usually provide some osmotic effect for twenty-four to forty-eight hours. Gelatin is nonantigenic and usually is not retained in the tissues. However, it depresses the concentration of serum albumin, increases the sedimentation rate of erythrocytes and produces pseudoagglutination of erythrocytes. In the pres-

---

Read at the annual meeting of the Minnesota State Medical Association, Minneapolis, Minnesota, May 27, 1952.

From the section of Anesthesiology and Intravenous Therapy, Mayo Clinic, Rochester, Minnesota.

ence of renal damage, the use of gelatin might well be avoided.

Administration of solutions of pectin increases the sedimentation rate and reduces the number of platelets. About half of the material is deposited in the body and its ultimate fate is not well understood.

Periston is a mixture of 50 cc. of 20 per cent polyvinylpyrrolidone in 236 cc. of Ringer's solution. This makes a 3.5 per cent solution. This material also increases the sedimentation rate. From 20 to 50 per cent of the amount administered is reported to be excreted in the first three days, but the manner of its elimination is unknown.

Dextran is a biosynthetic polysaccharide obtained from the fermentation of sucrose. The molecular weight varies from 50,000 to 105,000. The preparations of higher molecular weight seem to be more efficacious. Most of this material disappears in twelve to fourteen hours. A tenth to a half is excreted in the urine but the fate of the rest is unknown. Allergic reactions have occurred following its administration. Various commercial brands appear to have similar value in the treatment of reduced blood volume resulting from a measured hemorrhage. However, there is one preparation that has been found to increase the blood volume to a greater extent than others, according to Bollman and associates.

Bollman, Knutson and Lundy summarized their investigations of the use of various expanders of blood volume in restoring diminished blood volume resulting from a measured acute hemorrhage as follows: (1) The agents, in order of decreasing effectiveness, are dextran, gelatin, acacia and periston. (2) Dextran, gelatin, acacia and periston are about as effective as plasma, washed erythrocytes and whole blood. (3) Solutions of saline are ineffective in restoring diminished blood volume resulting from measured acute hemorrhage. (4) A state of adequate hydration is necessary to obtain the maximal effect from volemic substances.

The value of blood plasma was proved during World War II. However, it did not supplant whole blood, because it was found that many patients did not receive maximal benefit from administration of plasma until whole blood also was given. The occasional (in certain regions, the frequent) appearance of hepatitis ninety to 120 days after the administration of plasma discourages its use. Irradiation of plasma does not eliminate entirely the possibility of the transference of the offending agent in the plasma. The use of blood plasma in the Mayo Clinic has decreased greatly because there must be an avidly desired, specific therapeutic effect that plasma alone can supply before its administration is requested. On the other hand, occasions arise when the calculated risk must be accepted and plasma administered.

The use of fluids in the treatment of lowered blood volume may be summarized as follows: (1) Whole citrated blood is most desirable in such conditions as shock. Its use may be supplemented by use of one of the plasma expanders, if it is desired. (2) These supplements are effective for a limited period after administration. No more than a temporary therapeutic effect should be expected from their use. (3) The plasma expanders do not transport oxygen and therefore these agents should not be administered in unlimited quantities. (4) These supplementary agents may be lifesaving if blood is not available immediately.

2. To Increase the Capacity of the Blood for Carrying Oxygen.—This indication exists in patients who have reduced values for hemoglobin and erythrocytes occurring in such conditions as acute and chronic anemias, severe hemorrhages, certain blood dyscrasias or defective formation of blood. Such patients can expect beneficial effect only when the values for hemoglobin and erythrocytes are elevated by administration of whole citrated blood. It is good practice to provide transfusions of whole blood for patients who are in need of more hemoglobin and erythrocytes but whose physiologic mechanism has neither the time nor the ability to produce these two products. This is particularly true when the patient is being prepared for operation or when the patient is extremely ill.

The best estimate of the result of transfusions of whole blood should be based on the percentage volume of erythrocytes (as determined by the hematocrit) and the values for hemoglobin and erythrocytes, all of which determinations are made three to four days after the transfusion.

3. To Increase the Content of Protein in the Blood.—Occasionally it is assumed that a protein intake that is adequate for a healthy person is also adequate for a sick person. This is erroneous. A healthy man weighing 150 pounds (68 kg.) and measuring 69 inches (175 cm.) in height has about 235 gm. of blood protein, of which 150 gm. is albumin. This is responsible for 85 per cent of the osmotic power of blood plasma.

It is advisable to establish proper values for circulating protein prior to operative procedures and to maintain them during convalescence. If the amount of protein is inadequate, a greater tendency to shock may exist, edema of the intestines and other tissues may cause disruption of incisions, delayed healing of tissues may occur or the resistance to infections may be reduced.

Strumia and McGraw stated that it is possible to restore the total amount of circulating protein to normal in hypoproteinemic patients and to maintain these patients free from the complications usually met in hypoproteinemia by the intravenous administration of sufficient amounts of plasma proteins in the preoperative and postoperative periods. Injected plasma proteins are metabolized in a manner similar to that of ingested proteins, but they are not metabolized as quickly. It is probable that failure to observe an increase in plasma proteins after injections of plasma is caused by the fact that the concentration of plasma protein is measured rather than the total amount of circulating protein.

When the administration of blood plasma is to be considered, patients may be divided into two categories: (1) Patients may have normal reserves of protein but, because of shock or hemorrhage, experience a rapid decrease in the volume of the circulating blood. These patients respond readily to transfusions of whole blood or blood plasma. (2) Patients may have a lowered reserve of protein, and thus the lack of proteins in the tissues cannot be corrected readily by administration of blood plasma. Even the use of relatively large amounts of plasma may fail to produce a sustained and appreciable increase in the concentration of plasma protein in these patients. Nevertheless, administration of plasma to these patients generally is followed by a distinct therapeutic benefit, probably because of an increase in the total amount of circulating protein.

The loss of plasma from extensive burns is followed by hemoconcentration, producing decreased cardiac output and lowered flow of blood. Many workers still maintain that the use of plasma and whole blood is the treatment of choice for burns.

The use of serum albumin in an attempt to decrease cerebral edema under certain circumstances has been reported.[3] More recently, the use of a 20 per cent solution of dextran has been employed for the same purpose.[2]

4. To Increase Hemopoiesis.—Blood transfusion seems to have some beneficial effect on hemopoietic power, although the exact mechanism is not understood. It is generally agreed that dissolved hemoglobin stimulates the production of new erythrocytes by direct effect on the hemopoietic organs. Blood transfusions also increase the storage of iron in the spleen, bone marrow and liver. Blood volume expanders have no part in this effect.

5. To Increase Immunologic Factors.—The immunologic effects of blood transfusions are not understood satisfactorily. It is possible that transfusions have some therapeutic effect in infections, perhaps by causing a generalized improvement because of the addition of the blood cells of the donor and perhaps because of the addition of normal antibodies from the healthy donor.

Conclusions

Transfusions of whole blood are valuable therapeutic agents. The use of blood plasma and some of the component parts of the blood also plays an important role. The so-called blood volume expanders must not be disregarded entirely. They may be life-saving agents under conditions when the need for increased circulating blood volume is immediate but when whole blood or one of the component parts of blood may not be available immediately. These blood volume expanders should not be used to the exclusion of transfusions of whole blood. In some instances, transfusions of whole blood may be supplemented by use of these blood volume expanders.

Case Report

HERPES ZOSTER

Report of a Case Occurring in an Infant Eight Months Old

JOHN F. MADDEN, M.D.

Saint Paul, Minnesota

HERPES zoster occurring during infancy is extremely rare. In 1938 Lang[3] reviewed over 10,000 cases of herpes zoster and stated that the highest incidence of the disease in infants was less than 0.07 per cent of all cases. Comby[1] reported eighty-four cases of herpes zoster in children, the youngest being eight months of age. After an extensive review of the literature, Freud et al[2] found only five cases of the disease in the newborn period. To these they have added a case of herpes zoster occurring in a three-day-old infant. The following case is reported because of the young age at which it occurred.

Case Report

B. T., a white female child, aged eight months, was admitted to Ancker Hospital on December 15, 1948, because of an eruption confined to the right side of the chest. The mother stated that the eruption began about three or four days prior to admission. About the time the rash appeared the child was fretful, seemed feverish, and developed a cough and rhinitis. The lesions started on the posterior aspect of the chest, and new ones appeared rapidly so that at the time of admission it assumed a hemithoracic contour. The child was not exposed to any known case of varicella, herpes simplex nor herpes zoster.

The baby was of normal birth, weighing 8 pounds, and was the youngest of seven siblings. She developed normally and had one previous admission to the hospital at the age of four and-a-half months for acute bronchitis, from which she made an uneventful recovery. During the interval between hospital admissions she was normal and did not have any skin involvement other than mild intertrigo.

Physical examination showed a well-developed, well-nourished and alert white female infant who was not acutely ill, nor in any apparent distress. The pharynx and tonsils were moderately inflamed. A zonal eruption corresponding to the distribution of the fourth, fifth and sixth thoracic nerves was seen on the right side of the chest. The eruption was made up of groups of tense vesicles on an inflammatory edematous base. The lesions began just lateral to the thoracic spine and extended around the chest, ending anteriorly at the sternum.

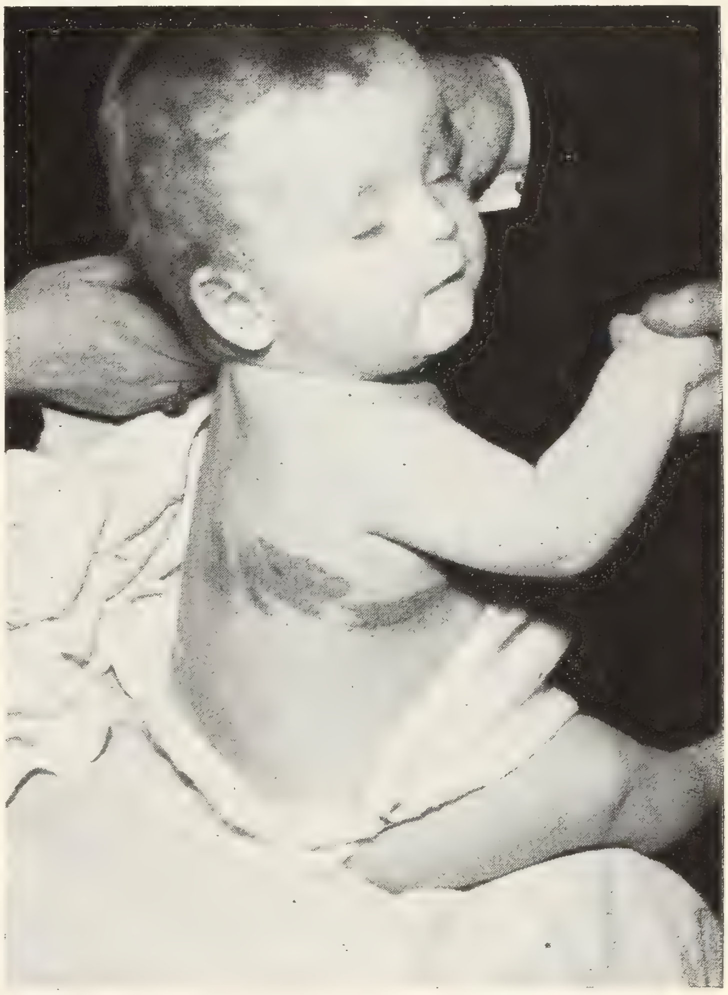

Fig. 1. Herpes zoster in an infant eight months old.

The eruption healed within two weeks; the progress was usual and the recovery uneventful.

President's Letter

A HIGH RATE OF INTEREST

A high rate of interest in state politics was evidenced in Minnesota's September 9 primaries.

Computation of this increased interest is accomplished through a brief glance at statistics. The Republican vote for governor, for instance, approximated 400,000; the DFL vote for the same office reached about 250,000. Both totals represent increases over primary votes in 1948 and 1950.

In 1948 the DFL party totaled 234,000 in the primaries in Minnesota; in 1950, the vote was 231,000. Republicans cast 379,000 primary votes in 1948 and 351,000 in 1950. A normal primary vote is about 580,000. This year's approximated 650,000 votes.

It is interesting to note that voting tends to increase in the state when a Presidential election is slated for the same year. Of course, a factor of considerable weight in this year's higher vote is the active "get-out-the-vote" campaign carried on by several public-spirited organizations. It can be hoped that this increase is a barometer for forecasting a higher rate of interest in the elections in November.

These statistics, no matter how encouraging on a state level, are sadly overshadowed by the figures on America's voting record in comparison to that of other free nations. In 1948, for example, there were about 96 million eligible voters in the United States. But in that year, only 49 million—about half of the eligible electorate—cast ballots in the Presidential election.

That figure becomes even more startlingly realistic when it is lined up—and at the bottom of the list—with the tabulation of votes for other nations:

Australia	96 per cent voted in 1951
Great Britain	83 per cent voted in 1951
Sweden	80 per cent voted in 1950
Western Germany	75 per cent voted in 1949
Canada	74 per cent voted in 1951
Israel	72 per cent voted in 1951
United States	51 per cent voted in 1948

An admirable goal for any conscientious organization or individual citizen would be to do everything possible to move this nation up as far as possible on that list. A convincing campaign, pleading with citizens to vote, should not be necessary, for it should be considered a privileged duty to cast a ballot in a free election.

Professional people are not the least offenders in this poor showing of electoral interest. Doctors should work as hard an anyone to make better this higher interest which showed up in the primaries. The November elections can be the vehicle by which America can show the world that it is not lacking in an active political conscience.

A doctor's sincere pledge to become intelligently informed and then to turn that intelligence to voting on November 4 will be an example of good citizenship, and one of the finest ways to increase that rate of interest in vital local, state, national and international political affairs.

CANCER DETECTION

"HOW LONG, O Lord, how long?" This question is often on man's mind in many areas of his activity. In few areas of human endeavor is this question asked with more fervor than in the field of cancer. Patients, physicians and cancer investigators, probing this mystery of nature, all look expectantly and hopefully to the day when cancer will no longer be the dreadful scourge it is today.

We know much about cancer. But there is much more we do not know. And how can we know? Only through patient and unrelenting questioning of the nature of cancer; of how it comes about and through what agencies it can be thwarted or prevented.

For almost 200 years, since anatomy was first studied, with a view to the examination and classification of diseases which affect organs, cancer has been largely in the domain of the pathologist. During the past seventy-five years, surgeons have affected an increasing concern over management of the cancer problem. And for approximately forty years roentgen therapy has been a strong therapeutic ally in certain areas of the cancer problem. Latterly, notable gains in the palliation of certain cancers has been accomplished through hormonal therapy and a few temporarily effective chemotherapeutic agents.

Surgery continues to be the mainstay of present-day therapy of cancer. The lament of surgeons is that so many cases come so late. When the cancer is local and has not penetrated beyond the organ in which the cancer had its origin and the regional lymph nodes are not involved, granted a good cancer operation is done including excision of the entire potential lymphatic drainage area, the cure rate is in the area of 75 per cent for a large number of cancers (breast, uterus, colon and rectum). For the year 1944, at the University Hospital, the five-year survival rate for all gastric cancers was 17.7 per cent, and for the resection group, in which the lymph nodes were negative, it was 64 per cent. This latter figure for the five-year interval between 1941 and 1945 was 56 per cent, and the total survival rate for the same period was 12.2 per cent. Bearing in mind the prevalent attitude toward gastric cancer of twenty-five years ago, this accomplishment offers a promising prospect.

Examination of our hospital records discloses the tragic situation that patients with gastric cancer are not coming to surgery earlier than they did fifteen years ago. In other words, as long as patients continue to come for treatment on the basis of symptoms, there will always be a fairly long lag phase. It has been quite definitely established for gastric cancer that the length of this silent interval is in the area of twenty months. It is very likely that the silent interval of other visceral cancers is of the same order of magnitude.

The major problem in cancer therapy today is the early recognition of cancer. Those words have rolled readily and comfortably off the lips of physicians for a generation. What has been done to give them meaning beyond the echo of a well-sounding but empty phrase? Sadly enough, very little. Can anything be done? Yes, indeed, something can be done, and now!

The figures published in this issue of Minnesota Medicine from the Cancer Detection Center at the University of Minnesota indicate that asymptomatic cancers are found frequently enough (1 per cent) among adults of more than fifty years to warrant continued probing of this method of attack upon the problem of earlier diagnosis of cancer. It is significant that, in more than 75 per cent of the cancers uncovered in this series, the regional lymph nodes were free of cancer. It is well known that when cancer is diagnosed on the basis of symptoms the converse is true; that is, lymph node involvement is observed in approximately 75 per cent of instances. It has become patently obvious in the last decade that the status of the regional lymph nodes in cancer is the most important determinant in the prognosis.

The promise of any idea is rarely apparent at its birth. Full maturation comes only with time. The techniques of the Cancer Detection Center are admittedly cumbersome and imperfect methods by which to recognize cancer. Yet, they are the best we have today. It would be nice to be able to detect cancer by far simpler means. And without question those means will come. Until simpler and more direct means are available, are we to hold back and say: all this labor is not worthwhile? That certainly has not been the attitude of the medical profession with other difficult problems.

The American people are expending many millions of dollars each year in the hope of resolving the cancer enigma. A considerable share of this expenditure goes for the support of research, and rightfully so. Research is the promise of the future. What is research? Will Mayo was fond of asking: should a method be discounted because it wears a practical label? The work of the Cancer Detection Center is imparting important meaning, comfort and hope to that easy phrase: earlier detection of cancer.

Every program has its detractors. This is not Utopia. The people of Minnesota and their physicians are making a contribution to earlier diagnosis of cancer in the support of the Cancer Detection Center. This activity, sponsored by the Council of the State Medical Association and supported by the Minnesota Division of the American Cancer Society, deserves the support of every physician in Minnesota. Progress is often painfully slow, for such, too, is the march of the mind. Not to advance is to retrogress. The work of the Cancer Detection Center indicates that progress in the recognition of cancer can and is being made by carefully selected screening tests. Who would discard these small gains until better methods are available?

In any issue affecting man, the two most important considerations are *cause* and *need*. That the fight against cancer is a great cause, no man need defend; that the need for better weapons is great is apparent on every hand. Cancer, when detected early, is curable. Let every physician lend his strength to meeting our needs in this important cause.

O. W.

Carcinoma of the gall bladder is notoriously an insidious disease and is usually not seen at an operable stage,

* * *

Abdominal pain, usually in the right upper quadrant, is the most characteristic symptom of gall-bladder cancer.

* * *

Cancer of the gall bladder, even in late cases, is often a relatively localized disease.

DOCTOR HENDERSON AND THE PRESIDENTIAL CAMPAIGN

On September 22, 1952, Dr. Elmer L. Henderson of Louisville, Kentucky, resigned as Chairman of the Co-ordinating Committee of the AMA which since January, 1949, has supervised the AMA National Education Campaign against socialized medicine. As of the same date Clem Whitaker and Leone Baxter, the director and manager respectively of the National Education Campaign, terminated their connections with the AMA. All three plan to devote their energies to the coming presidential campaign as individuals.

As the activities of the National Education Campaign terminate, it is only proper that appreciation should be expressed by the organized profession for the devoted service of Dr. Henderson who during these four critical years devoted his time and energies to the activities of the AMA. During these years he was president-elect of the national organization and simultaneously president of the World Health Organization. These gratuitous jobs are the biggest a physician can aspire to and are all man killers.

Dr. Henderson has come through what might be an ordeal to most of us with energy enough to be chairman of the newly formed National Professional Committee for Eisenhower and Nixon. This committee will enlist thousands of physicians, dentists, lawyers, engineers, accountants, pharmacists and other professional men and women in an aggressive bipartisan drive for the election of the Republican nominees for President and Vice President. Dr. Ernest Irons of Chicago and Dr. John W. Cline of San Francisco are vice-chairmen of the new committee as are also Harold J. Gallagher of New York, past president of the American Bar Association; Dr. Clyde E. Minges of Rocky Mount, North Carolina, past president of the American Dental Association; Robert Lincoln McNeil of Philadelphia, past president of the American Pharmaceutical Manufacturers' Association; Sidney L. Stolte of Saint Paul, past president of the National Society of Professional Engineers and John F. Forbes of San Francisco, past president of the American Institute of Accountants. Whitacre and Baxter will serve as campaign directors for the Eisenhower-Nixon professional committees drive. The committeee members are no longer officers of their respective professional associations and can take active part in political affairs without fear of criticism.

THE COMMITTEE FOR THE NATION'S HEALTH

RECENTLY in a column by Thomas L. Stokes in the *St. Paul Pioneer Press* (September 19) appeared a reference to Dr. Channing Frothingham, a prominent Boston physician and head of the Committee for the Nation's Health. To quote, "The doctor expressed surprise 'that General Eisenhower wastes words in attacking a scheme of federalizing medical care which has never been proposed in any bill before Congress and which is supported by nobody, least of all by those who support the decentralized free-choice-of-doctor plan of national health insurance which is backed by the President of the United States, the Congress of Industrial Organizations, the Committee for the Nation's Health and many other organizations.' " The doctor is sorry that General Eisenhower has been taken in by the AMA which has spent millions of dollars in publicizing the idea that national health insurance is regimented federal medicine. He (the doctor) states that under national health insurance, the public would receive medical care in the same way they do now by going to the doctor or hospital of their choice, the only difference being that the doctor and hospital would be paid from an insurance fund collected by the federal government along with federal security payment paid by the employe or employer and allocated to the states. He claims that no new army of clerks would be needed to handle the mountain of details which would be added if such a plan were installed. Doctors and hospitals would have nothing to do with the federal government as they would be paid from funds allocated by the federal government to the states.

Who is this Dr. Frothingham, who voices the absurd opinion that national compulsory health insurance would not alter the present status of the practice of medicine and would not require another army of federal employes? He is and has been for some years the head of the Committee for the Nation's Health, one of the strongest forces behind the administration's campaign for compulsory, tax-supported national health insurance. On its membership roll are such names as Eleanor Roosevelt, Philip Murray, William Green, Robert Sherwood and Max Seham. According to Secretary Lull of the AMA, ninety-two out of the 166 charter members of the Committee have been cited one or more times because of subversive connections or activities by the House Un-American Activities Committee. Over half of the members serving as officers and directors since its organization in 1946 have subversive records and have long been associated with avowed Communists. Poor company for good Americans!

DIABETES DETECTION WEEK
November 16-22

The purpose of designating one particular week as Diabetes Detection Week is to attract attention to the importance of detecting the unknown diabetic person. Diabetes, unknown and untreated, will lead to ill health and complications which could be forestalled by proper treatment. Here is one chronic disease for which, thanks to Banting and Best, there is a treatment which enables those with diabetes to lead normal lives, though it is not a cure.

The American Diabetes Association, Inc., with headquarters at 11 West 42nd Street, New York 36, New York, is again putting on a nation-wide Diabetes Detection Drive. State and local units are taking an active part in providing free testing of urine. The yearly drive merits the support of the profession.

MEDICAL ADVERTISING FIFTY YEARS AGO

We often think and with good reason that there is too much government regulation of our daily lives. One realm, however, in which there was a decided need, fifty and more years ago, of regulation was in the matter of the advertising of medical remedies in the lay press.

We recently had occasion to glance through a 1901 issue of a lay magazine published in Minneapolis and obviously catering to the interests of women. It is difficult to understand how such an array of advertisements of medical remedies so obviously false in their claims could ever have been tolerated. Intelligent readers must have recognized the falsity of the therapeutic claims so extravagently made and the low moral tone of advertising in general in past years.

In this particular journal a Chicago doctor advertises that he can prevent blindness and cure all diseases and defects of the eye. An offer of one hundred dollars is made for any case of deaf-

HOXSEY CANCER CLINIC LOSES CASE

A recent decision of a U. S. District Court in Texas has prohibited distribution in interstate commerce of the brownish-black, and pink liquids intended for the treatment of cancer in man. The suit was against Harry M. Hoxsey and his clinic for treatment of cancer, which has been in operation in Texas. The Government had appealed an earlier decision favoring Hoxsey.

The trial was based on the grounds that pamphlets and booklets used by Hoxsey constituted labeling which was false and misleading and misbranded the drugs when shipped in interstate commerce. These booklets contained testimonials from many allegedly cured patients. At the trial much evidence was presented on results of experiments showing the ineffectiveness of the Hoxsey drugs.

According to a recent release of the Food and Drug Administration, "The Government presented scientific evidence that Hoxsey's claimed 'cures' fell into three categories: They included patients who had never had cancer and were treated for it at the Hoxsey Clinic; patients who had been cured of cancer before they went to the clinic and were treated for cancer; and patients who had cancer and still have it or who died under the Hoxsey treatment. In this connection, the Government presented the physicians who attended these patients and the hospital records connected with them, and pathologists who examined the tissue to make the diagnosis of cancer."

Principles Laid Down

The following important principles were laid down in the Circuit Court opinion, based on testimony by cancer experts:

"1. . . . there is only one reliable and accurate means of determining whether what is thought to be cancer is, in truth and fact, actually cancer. This requires a biopsy, a microscopic examination of a piece of tissue removed from the infected and diseased region.

"2. . . . the opinion of a layman as to whether he has, or had, cancer, or a like opinion as to whether he has been cured and no longer bears the disease, if, in fact, it ever actually existed, is entitled to little, if any, weight.

"3. . . . despite the vast and continuous research which has been conducted into the cause of, and possible cure for, cancer, the aggregate of medical experience and qualified experts recognize in the treatment of internal cancer only the methods of surgery, x-ray, radium and some of the radio-active by-products of atomic bomb production.

"4. . . . Upon such subjects a Court should not be so blind and deaf as to fail to see, hear and understand the import and effect of such matters of general public knowledge and acceptance, especially where they are established by the overwhelming weight of disinterested testimony."

False, Misleading Medicines

The court of appeals stated that "the overwhelming weight of the credible evidence requires a conclusion that the representation that the Hoxsey liquid medicines are efficacious in the cure of cancer is . . . false and misleading. The evidence as a whole does not support the finding of the trial court that 'some it cures, and some it does not cure, and some it relieves somewhat.' "

Clinic Operations Cited

The Court heard testimony describing the operation of the clinic, noting that most patients were charged $400 for treatment. As many as thirty-five to fifty patients were "treated" each day. The method of treatment was to meet the patient, take pertinent information and then send him to a history clerk who took the patient's history, stressing previous diagnosis and treatment. Routine blood and urine examinations were made and x-rays taken. The patient then was sent to the Medical Director, an osteopath, who, on the basis of the history and laboratory findings, made the "diagnosis" and prescribed for the patient. The report from the Food and Drug Administration states:

"On leaving the clinic, patients are given a paper shopping bag containing the so-called 'supportive treatment' of vitamin preparations, laxatives, antacid preparations, and the cancer medicine (either the brown or pink solution) which is referred to as 'the tonic.' Usually a 30-day supply is provided. The patient is instructed to write to the clinic about his progress and to request additional medicine, which is shipped without further cost. This procedure may continue indefinitely, but some patients are advised that they are 'cured' and discharged."

Medicines Described

Makeup of the cancer "cures" is described by the report from the Food and Drug Administration:

> "The Hoxsey medicines are of two types: one for internal and the other for external treatment. The external treatment is composed of several escharotics . . . The internal treatment is composed of two medicines known as the black or brown medicine and the pink medicine. The black or brown medicine is composed of cascara sagrada, potassium iodide, extracts of buckthorn, prickly ash, red clover blossom, alfalfa, sugar and water.
>
> "The pink remedy is composed chiefly of elixir of lactated pepsin containing variable amounts of potassium iodide. In addition to the above, which constitute the chief treatment, 'supportive treatment' consisting of preparations containing iron, urinary antiseptics, vitamins, laxatives, and antacids is administered."

HEALTH COMMISSION MEETS; HEARS MANY STATEMENTS

The President's Commission on the Health Needs of the Nation met in regional session in Minneapolis on September 2 and heard testimony from nearly fifty individuals and organizations. The nine-hour meeting included statements from medical, dental, consumer, labor and farm groups regarding what each thought the health needs of the area were, and what is being and what should be done about them.

Six Points Discussed

The commission's goal in this meeting was to direct inquiry into six points of health interests:

1. Current shortages in health personnel,
2. The adequacy of local public health units,
3. The present status and adequacy of medical research,
4. The degree to which hospitals and clinics meet existing needs,
5. The extent to which people are able to afford adequate medical care, with particular reference to present health insurance plans and their adequacy,
6. The adequacy of federal, state, and local health programs.

Association's Views Presented

The statement of the Minnesota State Medical Association was presented by its president, Dr. R. L. J. Kennedy, Rochester, Minnesota. Dr. Kennedy criticized the commission for its short duration and the meager time alloted to each participant. He stated: "It is necessary to preface our statement by making it clear that the doctors of Minnesota, undoubtedly the most competent group to know what the health needs of the state are, feel somewhat surprised and disappointed to have only been allotted ten minutes to cover the vast subject of health."

Dr. Kennedy then went on to enumerate the many excellent health improvements fostered by Minnesota doctors throughout the years—those improvements being major contributory factors in bringing Minnesota into the spotlight as one of the healthiest states in the nation. Dr. Kennedy stated:

> "Since 1900 the average length of life in the United States has increased from 49.2 years to 67.2 years in 1948. In 1900 the total death rate in the United States was 17.2 per 1,000 population; for 1950 the rate was 9.6 per 1,000. The lowest mortality rates were in the states of this area—Iowa, Nebraska, Minnesota, North Dakota, South Dakota, Kansas and Wisconsin, each having a rate of at least 0.5 below the national average."

Calls Commission "Political"

After recounting methods by which the medical profession had met and continues to meet health problems, Dr. Kennedy described the feeling concerning the commission itself:

> ". . . the physicians of Minnesota . . . feel that the hearing itself has been poorly timed; . . . that it is political by intent and nature, a product of those political forces which have constantly drummed the idea into citizens of our country that medical science and the doctors of the nation have not provided adequate health and who assert that the government can do better . . ."

Dr. Kennedy pledged medicine's continued efforts toward improving the already fine health conditions. He said, "We believe that the health needs of the nation are not overwhelming, that they are being solved by the continued efforts of men of medicine and related fields who are free to practice and work without interference and control, that future problems in this field will be solved most completely and most satisfactorily by a medical profession which remains free to continue its earnest quest for even better health for all people."

CIVIL DEFENSE ACCUMULATES SUPPLIES

Stockpiling of drugs, equipment and other medical items for civil defense has begun on a large scale. Seven regional warehouses in the nation are being used as storage places bv the Federal Civil Defense Administration. In event of an attack they would be rushed to disaster areas to supplement local and state-owned medical supplies.

The Federal Civil Defense Administration estimates that on July 15 it had $1,574,378 worth of supplies stockpiled. This is only 2.67 per cent of the more than $60 million made available by Congress for this purpose. Most of the remaining supplies have been contracted for, and it is anticipated that a marked increase in the stockpiling will be noticed in months ahead.

Thirteen participating states have already received over $3 million worth of supplies, a sixth of the amount on order. Nineteen other states, the District of Columbia and the territories have also joined, but supplies have not reached them as yet. In all, about 20 million dollars worth of medical supplies have been ordered by the states. This brings the total for all civil defense medical programs to 80 million dollars.

Items Listed

Antibiotics are the largest single item in both federal and state stockpiles at this time, Federal Civil Defense Administration reports. Other items include drugs, whole blood equipment, surgical textiles and some instruments.

Fiscal 1953 funds amount to $60 million less than Congress allotted to the civil defense department for over-all expenses for fiscal 1952, ending July 1. The department will make a major decision on division of these funds; how much to spend on the whole blood program and how much on orders for other medical supplies.

KEEP ORANGE JUICE IN REFRIGERATOR

Unlike bananas, reconstituted frozen orange juice belongs in the refrigerator. Placed there, at 40 degrees Fahrenheit, "vitamin C losses will be negligible," states the Council on Foods and Nutrition of the American Medical Association. Vitamin losses occur when the reconstituted juice is allowed to stand in an open container at room temperature. According to the Council, "it is reliably estimated that approximately 98 per cent of the vitamin C content of the fresh fruit may be retained in the frozen concentrated juice when modern acceptable methods are used." (Council on Foods and Nutrition: J.A.M.A., 146:1-35, 1951.

HYDROCORTISONE IN RHEUMATIC DISEASES

(Continued from Page 943)

cortisone acetate usually can cause a prompt alleviation of the acute disability. Perhaps the greatest practical use of this agent will be in various forms of traumatic arthritis.

6. A limited experience indicates no specific value in the local use of hydrocortisone acetate in acute periarthritis of the shoulder.

MEDICAL ADVERTISING FIFTY YEARS AGO

(Continued from Page 965)

ness (caused by catarrh) that cannot be cured by Hall's Catarrh Cure. Several kinds of bust developers are advertised with illustration of what the user can expect. Vitalia cures cancer; Dr. Gunn's Liver Pills cure sick headache, clear the complexion and purifies the blood; Perry Davis' Painkiller affords a safe and quick cure for colic, croup, rheumatism and toothache; there are goiter cures, hair restorers, et cetera. Evidently health is not a new phase of public interest.

There was sore need for legislation to protect the less discriminating public from such fraudulent advertising. State laws directed toward dishonest advertising and the practice of medicine by other than licensed physicians as well as federal Pure Food and Drug laws and those affecting interstate commerce have done much for the public benefit.

Minnesota Academy of Medicine

Meeting of February 13, 1952

The regular monthly meeting of the Minnesota Academy of Medicine was held at the Town & Country Club on Wednesday evening, February 13, 1952. Dinner was served at 7:00 p.m. and the meeting was called to order by the Vice President, Dr. E. A. Regnier, in the absence of the President.

There were fifty-one members and four guests present.

Minutes of the January meeting were read and approved.

Dr. Ritchie read the annual Treasurer's report, and this was accepted.

The Secretary read a letter from Dr. John C. Brown, who is now living in California and who resigned. The Executive Committee recommended that his name be placed on the Senior Membership list. This was voted on and the transfer ordered.

The scientific program followed.

Dr. Asher A. White, of Minneapolis, then read his inaugural thesis on the subject, "Fallacy in Allergy," an abstract of which follows.

FALLACY IN ALLERGY

Abstract

ASHER A. WHITE, M.D.

Minneapolis, Minnesota

From the literature on allergy, an impression is gained of precise immunologic processes in operation in the production of disease. Despite the seeming clarity, when the physician begins to apply these methods in the study of the allergic patient, he finds that the expected results often fail to appear. As experience is gained, the student of allergy comes to realize that the methods of clinical allergy have serious shortcomings. The skin test is found to be unreliable, diagnosis of the allergic state uncertain, evaluation of offending allergens difficult and desensitization frequently misapplied. The present exposition is an attempt to reevaluate the known facts and to place fact and fallacy in perspective. We have attempted to pick out the fallacies, seek the reasons for their persistence, evaluate their results and review the facts with which they could be replaced.

The study of clinical allergy began after understanding of the phenomenon of anaphylaxis had pointed the way. The similarity between the dyspnea of the anaphylactic guinea pig and human asthma was apparent. Asthma and hay fever were observed to be concomitant so frequently that hay fever was also recognized as one of the manifestations of sensitization. Earlier work had suggested that airborne pollens were the cause of hay fever. It was a natural step to test the skin with suspected pollens and to attempt desensitization by increasing doses of the pollen suspected of causing trouble. The success of these methods gave rise to two basic errors of concept which underlie five additional fallacies. The fallacies must be abandoned and the underlying errors understood before the study of allergy can progress.

Underlying Errors

Fallacy 1.—Allergy follows the same laws which govern anaphylaxis.

Allergy and anaphylaxis are two different facets of the biologic process which results in the production of antibodies. There are important differences in the behavior of the two phenomena which lead to fallacies of procedure when the rules governing anaphylaxis are transposed to human allergy. The available knoweldge of immunologic processes may be compared to an iceberg. There is below the surface or beyond present knowledge a large portion of the mass. It may be, however, that the portion of immunology which lies beyond the threshold of knowledge contains the facts which will afford a better understanding of the laws which govern human allergy.

Fallacy 2.—Accuracy of diagnosis in pollenosis is due to the accuracy of skin test data.

The physician usually conceives that cause and effect relationships will be clearly manifest for other allergens, since they are clear in pollenosis. It is not realized that the accuracy of pollen diagnosis is due less to skin test results than to the exact knowledge of the degree and time of exposure to pollens, knowledge which is seldom ascertainable in symptoms produced by other allergens.

Fallacy 3.—Allergy is easily demonstrated.

The truth is that in a high percentage of allergic patients cause and effect relationships are not determined even after the most expert search.

Fallacy 4.—Skin tests are accurate.

Corollary Fallacies (a) Postive skin tests indicate allergic disease. (b) Substances causing positive tests produce symptoms. (c) Negative skin tests deny allergic disease.

The immediate skin reaction to test substances is not an accurate indicator as to which substances produce symptoms. A positive skin test does not signify that the patient is the victim of an allergic symptom nor that the substance causing the positive test will produce an allergic reaction. Substances producing positive skin reactions frequently cause no symptoms after exposure thereto. A positive skin test must be regarded as no more than a clue, the validity of which remains to be determined. The patient who shows no positive skin tests is not necessarily free from allergic disorder. Symptom producing substances frequently evoke no skin response.

Falacy 5.—The manifestations of allergy are pathognomonic.

Most physicians recognize that infection and emotion may induce symptoms identical to allergy. They are prone to use the term allergy to describe these symptoms without regard to the symptoms' mode of origin. The term should be restricted to symptoms produced by the antigen-antibody type of reaction to agents foreign to the body economy. The unfortunate result of looseness in use of the term allergy is that patients with syndromes due to causes unrelated to immune mechanisms are skin tested for reagin and are given desensitizing injections to substances having no relation to the symptoms.

Fallacy 6.—Small doses of allergen are symptom producing.

As a result of this erroneous belief inadequate methods of trial by exposure are used in evaluating allergic patients. In provocative feeding for instance, a small serving of the suspected food is usually offered. Experience indicates that in persons sensitized to a certain food, it may require three or four days of excessive feeding of that food before symptoms appear.

Fallacy 7.—Desensitization will protect against skin test positive inhalants. Desensitization is a satisfactory procedure against many inhalants toward which allergy has developed. The fallacy consists in regarding skin tests as affording accurate evidence of sensitization. As commonly practiced the diagnosis of allergic agents depends upon skin testing and is, therefore, seriously inaccurate. From the results of skin tests a diagnosis of sensitization to bacteria, to fungi, to house dust, or to other agents is made. Having arrived at a diagnosis based on false evidence, the fallacious conclusion is reached that desensitization to agents so diagnosed will be effective.

Discussion

Dr. F. W. Lynch, Saint Paul: I am glad to welcome Dr. White and tell him how much I enjoyed his sensible and sound discussion of allergy, a subject usually discussed with too much enthusiasm or with prejudice. It is said that eczema constitutes 10 to 30 per cent of the practice of allergists, and dermatologic practice includes many so-called allergic dermatoses, perhaps 35 per cent when the term is used broadly to include allergic reactions to drugs, contact dermatitis, and infectious and seborrheic eczematoid eruptions in addition to the atopic processes under consideration tonight. Practically all dermatologists agree with Dr. White's statement of the fallacy of depending on skin tests for foods, at least in patients with urticaria or atopic dermatitis. Reactions to tests for inhalants are in a more doubtful category but certainly not completely dependable. I think Dr. White has clearly stated a reasonable view as to the need for demonstrating a probable relationship between the allergic disease and the supposed sensitivity to house dust, pollens, et cetera, before proceeding with extensive (and expensive) attempts at desensitization.

It has been profitable to have Dr. White review the evidence and attempt to determine what is factual and what is fanciful in our assumed "knowledge" of allergy. Only on a factual foundation can further advances be expected to develop.

Dr. Jerome Hilger, Saint Paul: The allergic or altered-tissue reaction is common to all specialties. It is a striking thing to note the abhorence with which most medical men regard the implication that they are allergists. It seems that this is due, in large part, to the narrowness with which allergists have approached the problem. Foods and inhalants have constituted the major part of their interest. As is apparent from clinical observation, on the other hand, altered-tissue reactivity is more commonly derived from physical or emotional relationships than from the food or inhalant environment. Unless these former factors be given their place of relative importance, the whole subject of allergy becomes a narrow, inept one. I am inclined to agree that having the allergists isolate themselves into a narrow field as a speciality in medicine is a mistake. On the other hand, it is certain that they could not become a broad speciality covering altered-tissue reactivity in its broad sense for they would be encompassing the whole field of medicine. The subject has a very profound basis in reactions other than antigen-antibody. Certainly, the basal ganglia and the dependent or related endocrine axis are the heart of the problem. Accordingly, in Otolaryngology, we feel that the first approach to an allergic problem, in the true meaning of the word, is not through antigen-antibody testing but at the more productive root of the subject—the patient's basic physiologic balance.

It is good to have the fallacies of the narrow antigen-antibody approach exposed so frankly and factually as has been done by Dr. White this evening.

Dr. White, in closing: At a meeting of allergists a few years ago, the matter of Board Certification came up. Most of the responsible men made strong statements against a separate Board for certification in allergy. The general membership, however, voted for a separate Board.

In regard to the relationship between emotionally induced symptoms and those which are produced by antigen-antibody reactions, one may speculate in this way. It is known that certain forms of allergy are produced by the liberation of histamine in tissue cells. It may be that the reason the same phenomena can be produced by emotional reactions is that the substance liberated at the end organ in para-sympathetic nerve activity is acetylcholine which is a histamine-like substance.

Dr. Hilger has discussed the subject from the standpoint of the rhinologist and here we see the difference in definition of terms to which all of us are subject. He has used the term to apply to the symptom complex of edema of the nasal membranes, obstruction to the passage of air, and hypersecretion of mucus. This complex has been given other names such as vasomotor rhinitis and hyperesthetic rhinitis. It may be produced by antigen-antibody reactions, by bacteria and by functional nervous reactivity. My own preference is to use the term allergy only for the antigen-antibody type of reaction. The vasomotor rhinitis of infection is an interesting problem. The allergist and rhinologist sometimes discuss what is called intrinsic allergy of the respiratory membranes. The implication is that sensitization has developed to the bacteria which reside saprophytically or parasitically in the nasal membranes. There is, as yet, no proof as to whether this is an antigen-antibody phenomenon or one brought about by other forms of irritation. We simply know that it stimulates the reaction produced when we apply allergen to sensitized nasal tissues.

Dr. H. B. Sweetser, of Minneapolis, read his inaugural thesis on the subject, "Hiatus Hernia Masquarading as Coronary Disease." Lantern slides were shown.

HIATUS HERNIA MASQUERADING AS CORONARY DISEASE

H. B. SWEETSER, M.D.

Minneapolis, Minnesota

Angina pectoris literally is pain in the chest. More particularly, pain in the chest brought on by exertion, by emotion, or by a large meal, and relieved by rest and by vasodilators, especially nitroglycerin. This may or may not be accompanied by an abnormal electrocardiogram. If the electocardiogram is abnormal, we are usually quite satisfied with the diagnosis. If the changes in the electrocardiogram are minor or temporary, the patient is said to have coronary insufficiency; if they are severe and permanent, then the patient has a myocardial infarction. However, even with a normal electocardiogram in the presence of chest pain brought on by exercise and relieved by rest or nitroglycerin, angina pectoris is the presumptive diagnosis.

In the past three years I have three times made a diagnosis of angina or coronary thrombosis in patients who had as the cause of their pain hiatus hernia and who were relieved of their disabling symptoms by repair of the hernia—but whose surgery was delayed three months to three years because I was unconvinced that this condition could cause their symptoms.

Para-esophageal or hiatus hernia has been recognized for years as a cause for chest pain. Apparently, the first description of this anatomic abnormality was made by Paré in 1575. The first suggestion of associated symptoms was by Morgagni in 1769. After that there was little in the literature until 1919. Since then, there have been a great number of papers concerning diaphragmatic hernia. It was not, however, until 1931 that it was recognized that this hernia could give symptoms simulating those of angina pectoris.

In 1941, Chester M. Jones of Boston published the most complete description of the clinical picture. Since then, the literature has been full of good papers concerning diagnosis and treatment.

The textbooks mention hiatus hernia as another cause for anginal pain, and mention, conversely, anginoid pain as a symptom of hiatus hernia, but in both cases only incidentally.

Hiatus hernia is not a rare condition. Harsha says it is found in one-tenth per cent of routine chest films, and in routine gastrointestinal x-ray studies it occurs in .75 to 1.2 per cent. Sixty per cent are said to occur in people over fifty years of age and 30 per cent between sixty and seventy.

Symptoms may suggest peptic ulcer, intestinal obstruction, gallstone colic, cardiospasm and coronary occlusion. The most characteristic picture seems to be that of discomfort or pain on lying down and after meals, relieved by standing up and taking long breaths. The pain may be mild or severe, usually precordial, especially over the lower sternum or xiphoid and radiating either downward, usually to the left side of the abdomen, or occasionally upward toward the left shoulder, and sometimes down the left arm in the area characteristic of angina or coronary pain.

Report of Cases

Case 1.—A woman, aged sixty-seven, was seen in November, 1949. She had arthritis of the hands and a hypertension of 220/110. She was dyspneic on climbing one-half a flight of stars and had edema of the ankles after teaching all day. Glaucoma was already present, and two days after my first examination an operation was done for acute glaucoma. In February, 1950, she had a weak spell in class, and her dyspnea had increased so that she had to stop to rest two to five times on one flight of stairs.

On March 3 she had an attack of pain anteriorly in the left chest which radiated down the left side of the abdomen and was brought on by exertion. In the succeeding three weeks there were five similar acute attacks brought on by exertion or during meals, persisting until she vomited. On antispasmotics and sedatives there were three more attacks in ten weeks, the last one lasting four or five hours.

X-ray examination showed her hiatus hernia, and surgical repair was carried out on July 3, 1950 by Dr. Thomas Kinsella. One year later she had had no more of her "weak spells" and was able to climb stairs and carry on normal exertion, but was retired from teaching because of glaucoma and arthritis. Electrocardiograms before and after operation were normal and showed no change.

In this case, the location of pain was not entirely typical of angina pectoris, but the dyspnea on exertion and some elements in the onset of pain were. However, relief was obtained by repair of her hernia.

Case 2.—A man of fifty-three was seen in 1947 with a history of "angina;" that is, he had spells of pain under the sternum which radiated up to both sides of his neck and down both arms. These were precipitated by exercise, cold weather, and large meals, and lasted about five minutes. He had had a previous series of attacks four years before at the age of forty-four. He was slightly overweight; a moderate anemia was present, and his electocardiogram showed a depression of S-T_1 and $_2$ and a diaphasic T_4, which after a week became entirely positive. X-ray examination revealed a large para-esophageal hernia, but because of his cardiac condition, repair was not attempted. He changed his job, was careful about meals and exertion, and two years later was improved. In 1950 the attacks recurred, so in spite of his electocardiogram changing and because of pain continuing, in June, 1950, his hernia was repaired by Dr. Leo Culligan.

After that he had no attacks of pain for over a year, but now his doctor tells me that his pain is again present. Because of this recurrence, x-ray examination of his esophagus and stomach was repeated in January, 1952, and this time showed a small recurrence of his hernia. If his pain persists, he will now have a phrenicotomy.

This patient's symptoms were more confusing than those in the first case and accounted for a delay of three years in repair of his hernia. If it were not for the close correlation in time between the presence and absence of his hernia and the presence and absence of symptoms, it would still be difficult to believe that he did not have two diseases instead of one.

Case 3.—A woman of sixty-eight was seen first on June 19, 1948, complaining of chest pain which radiated down the left arm. In 1946 she was said to have had a "blood clot in her heart" and was kept in bed for four weeks. She had a relapse and was kept in bed two weeks more. She had had "asthma" all her life and had had heart trouble for ten years. Her blood pressure was normal, 150/85. Her heart was normal on physical examination. The electocardiogram was normal. She had a right rectus scar with hernia and a right inguinal hernia. Because of the character of her pain, my diagnosis was intercostal neuralgia. She had no relief from salicylates and heat, and two weeks later a diaphragmatic hernia was found by x-ray. She was treated with antispasmotics and sedatives, and was relieved for two weeks, when she was in an automobile accident and the pain recurred. After this she was seen at intervals for asthma (wheezes), left subdeltoid bursitis, pruritus ani and vulvi and pneumonitis. In February, 1951, she had "terrible" pains across her abdomen, relieved by three hot enemas.

In August, 1951, there was pain in her chest just to the left of the sternum radiating down the left arm but not to the shoulder, and she had trouble breathing. Her heart was normal, her blood pressure was 160/90, and the lungs were clear. However, her diaphragmatic hernia was much larger and so on September 20, 1951, her hernia was repaired by Dr. Kinsella. In November, 1951, she was still tired but had had no pain of "coronary type" at all and none down the left arm. The wheezing was much improved and she was thoroughly relieved that the pain which her family had come to consider as neurotic, had had a physical basis. Her electocardiogram showed left axis deviation but was otherwise normal throughout.

In August, 1952, she was entirely well.

In each of these cases there was pain which was most suggestive of angina or of myocardial infarction. One showed changes in his electrocardiogram which were thought to indicate myocardial damage; the other two showed no change. However, the picture in all was complicated and contained elements not quite explainable on the basis of heart disease.

The mechanism of "anginal" pain from hiatus hernia seems well established. In the large hernia, it is possible that simple mechanical displacement of the thoracic structures can cause dyspnea and pain.

In smaller hernias, the pain seems to be a referred pain of visceral origin. The peripheral areas of the diaphragm are supplied by the lower six thoracic nerves and pain from these areas is felt in the areas supplied by those nerves, i.e., in the side, back, and front below the sixth rib and down to the ilium.

The central part of the diaphragm is supplied by the phrenic nerve which arises from the third, fourth, and fifth cervical roots, and pain is felt in the skin areas supplied by the cutaneous nerves from these roots, i.e., in the shoulder, neck, and occasionally at the root of the thumb.

The esophagus is supplied by sympathetic nerves rising from the fourth to the sixth thoracic or, more likely, from the first to the sixth thoracic roots. Irritation of these nerves is felt in the upper thorax and on the inside of the arm and, if irritation is severe, it can extend to the distribution of the eighth cervical, i.e., to the little and ring fingers. Distention of the lower esophagus or the part of the stomach contained in the hernia, inflammation, or spasm initiated by emotion or excitement can all cause sympathetic over-stimulation and spasm in the smooth muscle. These motor disturbances are similar to those occurring in any hollow viscus and form the basis for most visceral pain.

Conclusion

Esophageal hiatus hernia is an important cause of symptoms which may simulate those due to serious heart disease. Differentiation, especially in the absence of electrocardiographic changes, may be difficult and depends, not only on a meticulous history and examination, but also on recognition by the physician that such confusion may occur at all.

Discussion

Dr. Leo G. Rigler, University of Minnesota: I was very much interested in Doctor Sweetser's presentation because we have had a long experience with hiatus hernia. Doctor Ude and I, I believe, reported the first series of cases in this part of the United States, although a larger series had earlier been reported from Boston. This was in 1928. These hernias are frequently missed when mass examinations are made and only the upright position used. This is because they undoubtedly spontaneously reduce themselves, especially in the upright position, while the patient is walking about. I recall being called to the operating room recently where Doctor Wangensteen was operating on a patient whom we thought had a very large hiatus hernia. He was unable to discover the hernia, although he found a sac around the stomach. On further study it became evident the hernia had reduced itself under the influence of the anesthesia and the relaxation. Interestingly enough, although at least one-third of the stomach had been above the diaphragm prior to operation, the opening in the hiatus was really not very large. I cite this case only to indicate how often this spontaneous reduction occurs.

In one of the films which Doctor Sweetser showed and in which he pointed to a peculiar shadow, the appearance was fairly characteristic of ulcer. It should be noted that hiatus hernia is commonly complicated by ulcer along the margin of the diaphragmatic orifice and this type of ulceration is one of the common causes of bleeding from the gastrointestinal tract.

We have had some experience with hiatus hernia causing symptoms similar to coronary disease. As far back as 1933, I can recall finding patients with hiatus hernia whose symptoms simulated angina pectoris. The famous story around our hospital concerns Dr. Logan Leven who, while he was a resident in our hospital, became acquainted with this syndrome. He then went to the Mayo Clinic where he saw the sister of a famous New York surgeon who had been all over the United States and been called a neurotic because of her anginal pains. On taking a careful history he found that the symptoms were greatly aggravated in the supine position, especially after she had been asleep, and he made a definite diagnosis of hiatus hernia which was later proved by X-ray examination.

Hiatus hernias are, in a large part, the result of sudden increases in antra-abdominal pressure which cause their herniation to occur although no doubt some change in the hiatus itself, either congenital in origin or as a result of age changes in the muscle, must first be present. With this in mind, Eneboe and I studied pregnant women to determine how much of a factor this was. We found evidence of hiatus hernia in about 20 per cent of multiparae and about 5 per cent of the primiparae. This compared with an incidence of something less than 2 per cent in the general run of our patients who came in complaining of symptoms. Interestingly enough, in the case of the pregnant women, after the termination of pregnancy, restoration to normal, occurred in a very high percentage of cases.

Dr. T. J. Kinsella, Minneapolis:—This subject is very interesting to me for several reasons. Confusion of this condition with coronary disease has been recognized for a long time. I remember well that Dr. Arch Logan taught us in 1921 that gall-bladder disease, hiatus hernia and coronary disease often presented similar symptoms.

Early in the picture, hiatus hernia may come and go as a sliding type of hernia in relation to position and abdominal pressure; hence, the necessity of making the x-ray examination in the Trendelenburg position. Symptoms in such patients may be relieved by lowering abdominal pressure by reducing weight. When in hiatus hernia the esophageal opening is into the pouch of the stomach above the diaphragm, ingestion of food distends the pouch pulling more and more of the stomach through the diaphragm. The occurrence of pain after a full meal or upon lying down should suggest hernia.

Dr. Kerkhof and I reported an interesting case last fall before the Minnesota Society of Internal Medicine. This patient had had a hiatus hernia which was repaired surgically and the phrenic nerve crushed. Six months later when pain recurred, a diagnosis of coronary disease was made. Dr. Kerkhof then saw her and recognized the trouble as a recurrence of the hernia. Relief was again obtained by interruption of the phrenic nerve. On two separate occasions about a year apart, recurrent pain was again diagnosed as coronary disease. Permanent relief was finally obtained by transthoracic resection of the phrenic nerve. The pain resulted from incarceration of a small gastric pouch. It is very important that the correct diagnosis be made for I am not anxious to operate upon a patient who has had a recent coronary infarction.

Dr. C. N. Hensel, Saint Paul:— It was back in 1945 that I first had my attention called to the fact that symptoms from hiatus hernia might simulate those arising from coronary sclerosis.

In the *Journal of the American Medical Association* for June, 1945, Doctor W. E. Clark of Washington, D. C., published an article entitled "Gastrointestinal Conditions Simulating or Aggravating Cardio-Vascular Diseases."

In this article he cited the case of a physician, aged fifty-two, who had attacks of pain over the sternum and down the arm, which would rouse him from sleep about 3 a.m. and were not completely relieved by ½ grain of morphine. There was referred pain to the inner aspects of both elbows and the little fingers of each hand. Gastric symptoms were entirely absent. Fever was absent, the leukocyte count was normal, the electrocardiogram was normal and the heart examination was normal. He stayed in bed for four days. His symptoms persisted in a mild form, but were aggravated by nervous tension.

He took a vacation in Florida for six weeks and played golf with only slight lessening of chest and arm pain.

An orthopedist then diagnosed the pain as due to faulty posture and advised exercises which were taken from April to September, but these brought no relief.

Finally, since the pain was localizing over the lower third of the sternum and discomfort after meals (relieved by belching) was becoming more frequent, a gastro-enterologist was consulted and he suggested that the symptoms might be produced by an hiatus hernia and this was demonstrated by x-ray. The establishment of the diagnosis was of decided value to the morale of the patient.

Medical management for some months was of uncertain benefit. Radical cure by surgery was deemed unwarranted, but dilatation of the esophagus was performed and there was a gradual abatement of symptoms.

Not all patients with hiatus hernia have symptoms.

There appears to be three groups. The first has a short esophagus and the cardiac end of the stomach is up in the chest and has probably always been there—these are apt to be symptom free.

In the second group the hiatus is large enough so that the stomach can herniate into the chest and return again below the diaphragm and not get caught. These also are apt to be symptom free.

In the third group the hiatus is small and when a small portion of the stomach herniates, it is apt to be caught and become incarcerated. This type is likely to cause symptoms.

Dr. Clark believes that patients with hiatus hernia are more apt to have symptoms with eating than with effort.

Dr. Tinsley R. Harrison in an article on "Clinical Aspects of Chest Pain" *American Journal of Medical Science*, 207:561, 1944, reported two interesting cases of angina of effort who also had attacks of chest pain on lying down.

Case 1.—A white man, aged fifty-five, complained of a feeling of sternal pressure radiating to the left shoulder, brought on by walking and relieved in 3-8 minutes by rest.

He had also noted that when he would lie down, the discomfort would set in within a few minutes and would become progressively worse until he assumed a sitting position, when the pain gradually disappeared. He insisted that the discomfort produced by lying down was identical in location and character with that caused by effort. However, the discomfort in the recumbent position tended to last longer if he remained in this posture. Sitting in a chair with the feet elevated would likewise produce a typical attack, while sitting in a chair in an upright posture with feet on the floor did not produce pain. Nitroglycerine relieved the pain produced by effort and also that produced by recumbency.

Repeated roentgenologic studies of the stomach revealed no evidence of hiatus hernia.

Electrocardiograms were made in various positions and also before and after exercise. It was found that the recumbent posture produced the same inversion of the T-wave in Lead I as occurred following effort.

Several months later, while walking slowly, the patient suddenly fell to the ground and expired.

This is an example of angina decubitus. The mechanism of pain production here is unknown.

Case 2.—A white woman, aged sixty-five, had had several attacks of "pressing" pain localized just to the left of the sternum in the precordial area, while washing dishes, and two attacks while walking uphill. Standing still or sitting quietly brought relief in a few minutes. In addition she had had numerous attacks of a similar nature on getting into bed.

Five weeks before admission to the hospital she had a severe attack of pain lasting several hours and associated with an initial rise in systolic blood pressure at 180 mm. followed by a fall to 120 mm., her usual pressure being about 160 m.m.

Several days later her physician heard a friction rub over the precordium which disappeared in 48 hours; at the time she had a slight fever.

When she was seen some weeks later the physical examination was negative except for minimal hypertension and slight cardiac enlargement.

Electrocardiogram revealed inpersion of T-wave in the precordial lead.

Fluoroscopic examination of the stomach showed a small hiatus hernia.

Note: The pain induced by recumbency was not relieved by nitroglycerine, but was benefited by atropine.

This patient has both coronary disease and hiatus hernia.

Dr. Chester Jones has collected 128 cases of hiatus hernia from his own personal cases and from those of the Massachusetts General Hospital. He found that the intake of food, especially a large meal, initiated substernal pain in fifteen out of twenty cases of hiatus hernia. Rather less frequently the act of lying down initiated symptoms of substernal pressure.

He found that nitroglycerine gave some relief, but was not the prompt and characteristic relief that is usually obtained in angina. However, belladonna gave relief to pressure in the chest, in eleven out of eighteen cases.

Since reading this article, I have had all my patients with doubtful chest pain examined in the head-down position for hiatus hernia, but so far I have found none.

Dr. Edward T. Evans, Minneapolis.—As a preface to my discussion, may I inform the members that I was a general surgeon from 1922 to 1926. In the reports of the Western Surgical Association meeting of 1924, you will find a case report of my father's in which he and I did a Polya anastomosis, which was carried out between the esophageal sacculation and the stomach because the sac could not be mobilized. I recall that I had a discussion with Doctor Adson as to whether or not one could safely sacrifice the left vagus and pheneric nerve if necessary.

In the historical review, I feel that Doctor Truesdale, of Providence, Rhode Island, should be included because his contributions to this subject were pioneer.

Dr. Wallace Ritchie, Saint Paul: There is another addition to that list of gall-bladder disease, hiatus hernia and coronary disease, and that is cervical disc. It is rare, but it does exist.

The meeting was adjourned.

Wallace P. Ritchie, M.D., *Secretary*

AUREOMYCIN IN INFECTIONS OF THE URINARY TRACT

(Continued from Page 948)

in which there was obstruction of the urinary tract or an indwelling tube or both. There was no case in which the original organism was known to have changed its sensitivity or to have become resistant to the antibiotic used.

Treatment with aureomycin was stopped in one case because of facial edema; however, the patient was receiving cortisone also. In another case use of the drug was stopped because of nausea. A third patient complained of minimal anal burning in spite of the fact that she was receiving only 0.75 gm. of aureomycin a day.

Summary and Conclusions

On the basis of this study it is concluded (1) that almost all infections of the urinary tract caused by Escherichia coli and Aerobacter aerogenes may be controlled by small doses of aureomycin in spite of the fact that the results of present sensitivity tests made before treatment may indicate the contrary and (2) that Pseudomonas aeruginosa and Proteus vulgaris are usually not sensitive to aureomycin but, when *in vitro* tests are available, they may be found occasionally to be sensitive to the drug in the urinary levels attainable with large doses.

Streptococcus faecalis responded to treatment with aureomycin in all the 5 cases in which it was isolated; Micrococcus pyogenes responded in two of the three cases in which it was isolated.

The side reactions to aureomycin in the low doses here given were negligible.

No increase in resistance of the bacteria to aureomycin was discovered in this group of patients studied.

◆ Reports and Announcements ◆

REGULAR CORPS EXAMINATION FOR MEDICAL OFFICERS, USPHS

A competitive examination for appointment of Medical Officers to the Regular Corps of the United States Public Health Service will be held on January 6, 7, and 8, 1953. Examinations will be held at a number of points throughout the United States, located as centrally as possible in relation to the homes of candidates.

The Regular Corps is a commissioned officer corps composed of members of various medical and scientific professions, appointed in appropriate categories such as medicine, dentistry, nursing, engineering, pharmacy, et cetera.

Appointments will be made in the grades of Assistant Surgeon (equivalent to Navy rank of Lt., j.g.) and Senior Assistant Surgeon (equivalent to Lieutenant). In making assignments, consideration is given to the officer's preference, ability, and experience; however, all commissioned officers are subject to change of station and assignment as necessitated by the needs of the Service. Appointments are permanent in nature and provide opportunities to qualified physicians for a life career in clinical medicine, research, and public health. Applicants who successfully complete this examination may ordinarily expect appointment as soon as they become eligible.

Application forms and additional information may be obtained by writing to the Chief, Division of Commissioned Officers, Public Health Service, Federal Security Agency, Washington 25, D. C. Completed application forms must be received in the Division of Commissioned Officers *no later than November 25, 1952.* Applications received after that date may not be accepted and will be returned to the applicant.

MEDICAL SERVICES FOR MILITARY PERSONNEL

In order that civilian hospitals and physicians may be familiar with the only circumstances under existing laws whereby they can be compensated from appropriated funds for medical services furnished military personnel, the following information is furnished:

(a) Charges for civilian medical treatment furnished military personnel on duty or who are absent from their station on pass, sick leave, ordinary leave, or terminal leave and who are injured or become ill, are payable from public funds *only* when the required treatment cannot be furnished from nearby facilities of the Army or other Federal agency.

(b) Civilian hospitals and physicians should limit their treatment of military personnel to emergency conditions of an acute nature, as charges for treatment of chronic conditions or elective medical or surgical treatment *cannot* be allowed.

(c) Private rooms and special nurses should not be provided unless prior authorization therefor is obtained from the Chief, Minnesota Military District, 1006 W. Lake Street, Minneapolis, Minn.

Military personnel who are absent from their station without proper authority (AWOL) are *not* entitled to civilian medical treatment at public expense.

In order to be assured of being remunerated for their services, civilian hospitals and physicians should conform to the following:

(a) On admission of a service man, hospital authorities should ascertain that the individual is actually in the active military service, and whether he has in his possession copies of orders authorizing absence from assigned station, and whether such orders authorize ordinary leave, sick leave or terminal leave.

(b) Immediately notify the commanding officer of the station to which the individual is assigned and the Chief, Minnesota Military District, 1006 West Lake Street, Minneapolis 8, Minnesota, of the fact of illness, by wire or letter, giving his name, rank, organization and the diagnosis.

(c) If an Army hospital or dispensary or any other Federal hospital or dispensary is located in the vicinity, telephone request should be made on that installation for ambulance transportation and required attendants to remove the patient to a Federal medical installation. No patient will be transferred where it is thought that the transfer might jeopardize the patient's condition, however. Military authorities will be notified immediately.

MOBILE ARMY SURGICAL HOSPITAL

A recent announcement by the office of the Surgeon General of the Army states that the Mobile Army Surgical Hospital (MASH), organized just two weeks after the outbreak of the Korean war and located at its present position just behind the front lines since last October, has just treated and evacuated its 50,000th battle casualty. Helicopters and ambulances have brought in wounded troops for American, Korean, British, Canadian, Australian, New Zealand, Filipino, Turkish, Columbian, Ethopian, Thai, French, Netherland, Belgian, Luxemburg and Greek units. Hospital personnel takes pride in the amazing patient recovery rate of 99.8 per cent.

MILITARY SURGEONS' MEETING

Reserve officers of the medical services of the Army, Navy and Air Force will be given complete information on all new directives, including pending Congressional legislation, governing their commissions, active duty requirements and retirement benefits in one of the feature presentations of the fifty-ninth annual meeting of the Association of Military Surgeons which will be held at the Statler Hotel, Washington, D. C., November 17-19, under the presidency of Major General Harry G. Armstrong, Surgeon General of the Air Force.

HOSPITAL SPEED and SAFETY for the PRIVATE OFFICE

Autoclave Sterilization—Always the Safest—
Now the Fastest—with the

NEW PELTON FL-2

Reduces minutes to seconds between consecutive sterilizing periods.

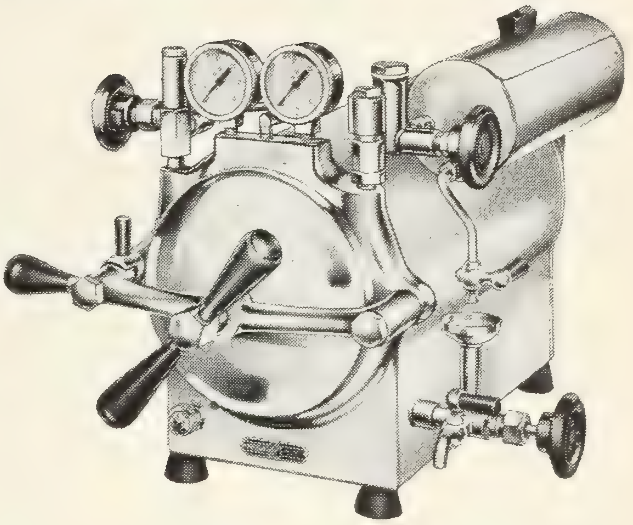
No more waiting periods for the necessary pressure and temperature.

No more wasted time.

No more watching gauges.

Applying the principles of steam heated Hospital Sterilizers, the FL-2 Autoclave now brings to the private office a self-contained unit which produces and stores steam under pressure.

Price—**$250.00**



(Write for literature or see our representative)

C. F. ANDERSON CO., Inc.
MINNEAPOLIS 2, MINN.

Point credits for retirement will be given all eligible reserve officers attending the scientific session

President Truman has been invited to speak at the traditional banquet of the Association on the evening of November 19.

The program will include the following speakers: Louis H. Bauer, M.D., President of the American Medical Association; Dr. Otto Brandhorst, President of the American Dental Association; Melvin Casberg, M.D., Chairman, Armed Forces Medical Policy Council; Brig. Gen. J. A. McCallam, President-elect American Veterinary Medicine Association; Rear Admiral Lamont Pugh, Surgeon General of the Navy; Isador S. Ravdin, M.D., Philadelphia, Pennsylvania; Howard A. Rusk, M.D., New York City, New York; Brig. Gen. Oscar P. Snyder, Dental Corps, USA; Brig. Gen. William L. Wilson, USA, Federal Civil Defense Administration.

VA COURSE IN PSYCHIATRY AND NEUROLOGY

The Veterans Administration is instituting a four-month intensive training course in psychiatry and neurology to fit the needs of physicians without such previous training who are assigned to duty in twenty-two predominantly psychiatric hospitals. Physicians who have been engaged in general practice may request this training upon applying for a position at one of these hospitals.

The course will be held at the VA Hospitals in Coatesville, Pennsylvania; Palo Alto, California; and a joint Downey-Hines, Illinois, program near Chicago, Illinois. Physicians will be employed at salaries commensurate with their training and experience (salary range: $5,500 to $11,800 per annum) and assigned to the course with travel and per diem for the four-month period.

Information and applications may be obtained from your nearest VA Hospital or Regional Office, or by writing to the Chief Medical Director, Veterans Administration Central Office, Washington 25, D. C.

POSTGRADUATE COURSE, CHEST DISEASES

The Fifth Annual Postgraduate Course on the Recent Advances in Diseases of the Chest, sponsored by the Council on Postgraduate Medical Education and the New York State Chapter of the American College of Chest Physicians, will be presented at the Hotel New Yorker, New York City, November 10-14, 1952.

This course is open to all physicians, but the registration will be limited. Tuition fee is $50.00; applications will be accepted in the order in which they are received.

A copy of the prospectus together with an application form can be secured from the: Executive Director, American College of Chest Physicians, 112 East Chestnut Street, Chicago 11, Illinois.

This course has been approved for credits by the American Academy of General Practitioners.

Migraine In Children

"Migraine may appear during the first years of life. The presence of subjective signs, such as headache and flimmer scotoma, is often difficult to determine in young children. The true nature of the symptoms frequently remains obscure for years."

Vahlquist, B. and Hackzell, G.: Acta Paediatrica *38*: 622 (1949).

NO. OF CASES	SEX	AGE AT ONSET	CYCLIC VOMITING	DURATION OF ATTACK	INTENSITY
31	8 ♀ 23 ♂	3 yrs. (mean)	3 out of 31	2½ hrs.	severe in all cases

TABLE CONT'D

NO. OF CASES	UNI-LATERAL HEADACHE	NAUSEA	FLIMMER SCOTOMA	VERTIGO	HEREDITY
31	18 out of 31	31 out of 31	12 out of 31	6 out of 31	20 out of 31

(reference given above)

In a study of 400 adult migraine patients, it was revealed that 34% had suffered attacks before the age of 15.* These investigators concluded that childhood migraine was a much greater clinical problem than was previously believed and that psychodynamic mechanisms played an important part in the disease.

These criteria are useful in diagnosis:

Headache attacks with symptom-free intervals plus (at least two of the following) nausea, scintillating scotoma, hemicrania, and hereditary predisposition.

For symptomatic relief in these cases, Cafergot®, N.N.R. (ergotamine with caffeine) may be administered orally. For best results, give adequate dosage promptly.

For children within the age range 7 to 12 years—Cafergot® is administered, one tablet when the attack appears imminent followed by one additional tablet within 30 minutes. Not more than two Cafergot tablets should be administered to children within this age range.

In the adolescent age group, 12 to 18 years of age, the dosage may gradually be increased as necessary up to the usual adult dose, i.e., two tablets when the attack appears imminent followed by one tablet doses at half hour intervals until the attack is aborted. *(Total maximum dose for adults: six tablets for each attack.)*

GENERAL PRACTICE REFRESHER

The program for the second annual Fall Refresher of the Minnesota Academy of General Practice to be held at Hotel Radisson on Wednesday, October 29, 1952, will be as follows:

8:20	Medical Film
9:00- 9:20	Tague C. Chisholm, M.D. "Treatment of Hernia in Children"
9:20- 9:40	Paul S. Blake, M. D. "Head Injuries"
9:40-10:00	R. N. Bieter, M.D. "The Antihistamines and Related Drugs"
10:00-10:20	L. A. Lang, M.D. "Local Anesthesia in Obstetrics"
10:20-10:40	Exhibits
10:40-11:00	Mr. Manley Brist "The Doctor and the Law"
11:00-12:00	Phillip Lewin, M.D. (Chicago) "Painful Feet"
12:00	LUNCHEON Philip Thorek, M.D. (Chicago) "Jaundice" To be discussed by Cecil J. Watson, M.D.
2:00- 2:40	Symposium—Skin Disease: E. T. Ceder, M.D., and Orville Ockuley, M.D. "Treatment and Management of Dermatitis"
2:40- 3:20	Symposium—Office Gynecology: Melvin B. Sinykin, M.D., and Louis Friedman, M.D. (St. Paul)
3:20- 3:40	Exhibits
3:40- 5:00	Symposium on Hypertension 1. E. T. Bell, M.D. (Moderator) 2. A. C. Corcoran, M.D. (Cleveland) 3. J. E. Estes, M.D. (Rochester)
5:00- 5:30	Social Hour

Reservations should be made with Dr. Robert Quello, 730 La Salle Building, Minneapolis, Minnesota. There will be no registration fee. $4.00 luncheon ticket is required for admission.

CONTINUATION COURSES

On November 21 and 22, the University of Minnesota will present a *Conference on Pemphigus and the Bullous Dermatoses* for dermatologists. The one-and-a-half-day session will be devoted to the consideration of the pathology, physiology, clinical characteristics, and treatment of the bullous dermatoses.

Several distinguished authorities in this field will participate: Dr. Herman Beerman, Chairman and Professor, Department of Dermatology and Syphilology, Graduate School of Medicine, University of Pennsylvania, Philadelphia; Dr. Walter F. Lever, Assistant Professor, Department of Dermatology, Harvard University Medical School, Boston; and Dr. Stephen Rothman, Professor and Head, Section of Dermatology and Syphilology, University of Chicago. The course will be presented under the direction of Dr. H. E. Michelson, Professor, Department of Medicine, and Director, Division of Dermatology; and the remainder of the faculty will include members of the clinical staff of the University of Minnesota Medical School and the Mayo Foundation. The conference will be held in the Center for Continuation Study on the University of Minnesota campus.

PEDIATRICIANS' SYMPOSIUM

Prominent researchers in the field of electrolyte metabolism (the way in which various salts are handled inside the human body) visited the University of Minnesota campus, September 22-24 for a national symposium on the metabolism of potassium (a salt found in the human body principally inside body cells). The three-day meeting which was of special interest to pediatricians, was sponsored by M and R Laboratories, Columbus, O.

Lecturers at the sessions in the Minnesota Museum of Natural History includes Dr. Daniel C. Darrow, Yale university pediatrics professor, who spoke on "The Role of Water and Electrolyte Deficits in Infantile Diarrhea"; Dr. Willis H. Thompson, assistant pediatrics professor at the University of Minnesota, who talked on "Antagonism Between Sodium and Potassium in Their Effects on Glycosuria and Blood Pressure in Diabetic Children"; and Dr. Thaddeus S. Danowski, professor of research medicine, University of Pittsburgh, who discussed studies in diabetic coma and acidosis.

Two other speakers were Dr. Robert Trail, a colleague of Dr. Danowski's, on "The Relationship of Potassium Metabolism to Cardiac Function," and Dr. Howard B. Burchell, associate professor of medicine, Mayo Foundation, speaking on "Electrocardiographic Changes Related to Disturbances in Potassium Metabolism."

Dr. Irvine McQuarrie, head of the University of Minnesota's pediatrics department, was general chairman of the symposium.

SOUTHERN MINNESOTA MEDICAL ASSOCIATION

At the annual meeting of the Southern Minnesota Medical Association held at Austin, September 9, the following officers were elected:

President: Dr. H. J. Nilson, Mankato; First Vice President, Dr. William Bernstein, Saint Paul; Second Vice President, Dr. David P. Anderson, Austin; Secretary-Treasurer, Dr. C. F. Strobel, Rochester (re-elected).

Dr. John D. Dahlstet was awarded a medallion for making the outstanding case report, one dealing with Friedlander's pneumonia. The outstanding scientific paper was presented by Dr. L. M. Hammer, on the treatment of cutaneous malignancies.

UPPER MISSISSIPPI MEDICAL SOCIETY

The Upper Mississippi Medical Society met at Bemidji, September 6, with Dr. Maurice Mosby of Long Prairie, presiding. Dr. G. I. Badeaux of Brainerd is the permanent secretary.

Scientific papers were presented at the morning session. Dr. L. C. Lundsten of the Bemidji Clinic presented a diagnostic problem with its solution; Dr. J. W. Griffin, also of the Bemidji Clinic staff, gave his experiences with acute and chronic pancreatitis; Dr. A. H. Benson, urologist, Little Falls, outlined indications for cystoscopy and spoke on the more common urologic disorders.

Dr. Douglas Johnson, Little Falls, just back from an American Medical Association public relations meeting

FAMILY NURSING SERVICE

October 16 to December 11 are the dates selected by Family Nursing Service, Wilder Health Center, Saint Paul, for the next series of eight classes for expectant mothers. The classes will be held each Thursday morning from 10 to 11:30 a.m. at the YWCA, 123 W. 5th Street.

The emphasis is placed on prenatal care to impress the expectant mother with its importance. The whole series is designed to supplement the physician's instructions.

The classes are taught by a public health nurse and the Nutrition Consultant. The subject matters include the anatomy, physiology of pregnancy, progress of childbirth, mental and personal health, child care, and development and nutrition. Emphasis is placed on nutrition, mechanics of labor, and care of the new baby. Nutrition is discussed with respect to its value to the mother during pregnancy and at time of labor and delivery. The importance of adequate nutrition for the baby during the prenatal period is also reviewed.

Registration fee is $2.00. An expectant mother may enroll for these classes by calling Family Nursing Service, CEdar 0311 or GArfield 8181.

Woman's Auxiliary

AUXILIARY PLANS FALL MEETING

The annual fall School of Instruction of the Woman's Auxiliary to the Minnesota State Medical association will be held in the Hotel Saint Paul on October 10.

Auxiliary members will be privileged to hear Senator Edward J. Thye at the 12:30 p.m. luncheon. Following this, Mrs. James McDonnough, Chicago, fourth vice president of the Woman's Auxiliary to the American Medical Association, will discuss organizational problems, and Mrs. Harold F. Wahlquist, Minneapolis, immediate past president of the national auxiliary, will report on the Minnesota Public Health Conference.

The morning session will include the Fall board meeting and will be followed at 10:15 a.m. by a public relations panel. Members will hear Wallace Fulton, Acting Director of the Division of Public Health Education, Minnesota Department of Health; Victor Cohn, science writer for the *Minneapolis Morning Tribune;* Jim Bormann, news director, WCCO; and Mrs. Louis Minion, Home and Community Director for the Minnesota Farm Bureau Federation.

Following the afternoon speakers, auxiliary members will hold round-table discussions for instructing new committee chairmen in their duties for the coming year.

Mrs. Leonard Arling, Minneapolis, is chairman of the School of Instruction meeting.

In Memoriam

WILLIAM PAUL EUGENE BERWALD

William Paul Eugene Berwald, former fellow in neurosurgery, Mayo Foundation, Rochester, Minnesota, died on June 11, 1952, in San Bernardino, California.

Dr. Berwald was born July 11, 1910, in Syracuse, New York. He received the degree of M.D. in 1935 from Syracuse University. He interned at the Syracuse University Hospital of Good Shepherd for one year, and was assistant to Dr. W. Williams and intern at Highland Hospital and St. Mary's Hospital in Rochester, New York, for one year. He entered the Mayo Foundation as a fellow in neurosurgery in July, 1937, and left the Mayo Foundation in June, 1939. He practiced neurosurgery for several years with Dr. W. Williams in Rochester, New York, after which he went to Patton, California, where he practiced neurosurgery until the time of his death. He was affiliated with Redlands Community Hospital in Redlands and Patton State Hospital in Patton.

Dr. Berwald was a member of Alpha Omega Alpha and Sigma Xi.

JUSTIN CHARLES LANNIN

Dr. J. C. Lannin, a practitioner of Mabel, Minnesota, since 1911, died on August 26, 1952, in Saint Paul. He was sixty-nine years of age.

Born at Winchester, Ontario, on July 11, 1883 he attended the local schools. He taught school before attending McGill University where he graduated in medicine in 1909. He interned at Montreal General Hospital and practiced at Caledonia, Minnesota, for a year before moving to Mabel.

In 1950, the annual picnic and get-together of the Newberg-Preble Farm Bureau was designated Appreciation Day for Dr. Lannin, in celebration of thirty-nine years of practice.

Despite a busy practice, Dr. Lannin devoted considerable time and energy to the civic welfare of Mabel. He served on the school board and was president of the board of directors of the Mabel Telephone Exchange Company.

On June 5, 1912, Dr. Lannin married Fannie Gordinier, who with their two sons, Drs. Donald and Bernard Lannin, both surgeons of Saint Paul, survives him.

EDWARD H. RICHTER

Dr. Edward H. Richter, physician at the State Hospital at Fergus Falls, died August 27, 1952, following a heart attack. He was fifty-eight years of age.

Dr. Richter was born May 13, 1894, at Foreston, Illinois. He grew up in Dell Rapids, South Dakota, and received his M.D. degree from the University of Minnesota in 1922. He practiced medicine in Hunter, North Dakota, from 1923 until 1950, when he moved to Fergus Falls.

Dr. Richter married Alice Hartwell at Pierre, South Dakota, on September 14, 1920. His wife, a daughter Ruth, and a son Paul survive him.

RICHARD E. SCAMMON

Dr. Richard E. Scammon, well known in the field of anatomy and research and former professor of anatomy at the University of Minnesota, died at his home in Brantson, Missouri, on September 12, 1952.

Dr. Scammon was a native of Kansas City and attended the University of Kansas. He earned the degree of Ph.D. in Medical Sciences at Harvard in 1909.

In 1911, he joined the University of Minnesota faculty in the anatomy department. In 1930, he accepted the position of dean of biological science at the University of Chicago where he remained for a year. He then returned to the University of Minnesota as dean of medical sciences. His was an investigative type of mind, and Dr. E. T. Bell is quoted as stating that it was a mistake for Dr. Scammon to let administrative work interfere with his research. He was a born teacher and ambidextrous in illustrating his lectures on the blackboard. While his research in human growth was outstanding, his originality was not limited to anatomy. He it was who worked out a pension system for the faculty of the University. According to Dr. Edward Boyden, now head of the University's department of anatomy, Dr. Scammon was an expert in mathematics, architecture, ecclesiastics and economics, as well as medicine. An entertaining talker, he was the center of attentive groups at medical gatherings. In short, he was that rare type of human being known as genius.

Dr. Scammon is survived by his wife, Julia, a son Richard M. and a daughter Jean. He was sixty-nine years of age at his death.

The God who gave us life gave us liberty at the same time.—Thomas Jefferson.

The Stability . . .

OF INCOME

One characteristic usually associated with a bond is that it has an established rate of interest; the investor therefore can compute the annual income he may expect from the date of purchase to the date of final maturity. A bond, like a note or mortgage, is a promise to pay a stipulated amount at a designated future date with interest to accrue in the meantime. This provides STABILITY OF INCOME—once a sound investment is made the annual income is fixed and is not altered by changing economic conditions or market fluctuations.

During the past several years, however, this STABILITY OF INCOME has been impaired by increasing Federal income taxes. The income that invested savings earn, when subject to such taxes, does not enjoy complete STABILITY OF INCOME since a change in the tax rate requires an adjustment in actual "spendable" income received—if taxes rise the effective income is reduced.

Because the income from Municipal Bonds is exempt from present Federal income taxes, Municipal Bonds enjoy a STABILITY OF INCOME not available to investments having taxable income.

We invite you to investigate the advisability of placing your savings in Municipal Bonds, one of the oldest and most widely employed means of investment, and we suggest you write for a copy of our free pamphlet and an example of Municipal Bonds currently available for your investment funds.

BLUE CROSS-BLUE SHIELD NEWS

Blue Shield

On October 1, Minnesota Blue Shield's increased and revised Schedule of Payments went into effect. Also effective on the same date was the revised contract providing additional benefits. And all of these increased allowances or benefits have been approved and put into effect by the Board of Directors without any simultaneous or anticipated increase of the premium.

As these changes became effective, Minnesota Blue Shield had increased its benefits or fees four times during the first five years of its existence. On August 1, 1949, the appendectomy fee was raised from $75 to $100 and emergency medical care fees were added. On January 9, 1951, the policy of paying for surgical procedures

in the office treatment of surgical wounds and also as many as three subsequent surgical office calls represented a distinct increase in the Blue Shield allowances. And on May 1, 1951, the tonsillectomy fee for children under thirteen years of age was increased from $25 to $30. With the eighty-one fee increases now effective, this represents as rapid a rate of benefit increase as has been found in any Blue Shield plan in the country.

Among some of the more important present benefit increases are: (1) twenty-seven surgical operations, the fees for which have been increased $50, raising them from $150 to $200, (2) addition of sixteen new items never before listed in the Schedule of Payments, (3) increase of in-hospital medical care from twenty-one to thirty days per illness during any twelve consecutive months, and (4) increases in the fees for emergency medical care for conditions hazardous to the subscriber's life. In addition to these, approximately fifty other operations or surgical procedures have higher fees than were paid under the old Schedule of Payments.

These benefit increases have been approved by the Board of Directors in spite of possible financial hazards associated with some of them. To avoid difficulties and to keep the road ahead clear for any future increases, the help of every member of the medical profession in avoiding abuses of the new Schedule of Payments is a vital necessity. With these changes, Minnesota's Blue Shield program becomes one of the most liberal of all the seventy-eight plans in existence. In this sense, it merits the profession's pride and deserves the cooperation of every physician.

Previous experience has indicated that the transition from one Schedule of Payments to another often requires double claims processing, leads to payment of allowances according to the wrong Schedule of Payments, and involves misunderstandings or disturbed physician and subscriber relationships. All of these can be avoided by filing all claims for services rendered prior to October 1, just as soon as possible after completion of the service.

These benefits or fee changes actually represent a colossal undertaking for the benefit of the subscribers primarily and the doctors who provide the service secondarily. Their effectiveness and the program's success are dependent upon the support and cooperation of the medical profession.

Non-Group Enrollment Campaign Nears Close

As the sixth Minnesota Blue Cross-Blue Shield non-group enrollment campaign nears it close, inquiries are being received at an encouraging rate from all sections of Minnesota. However, doctors and hospital management factors are reminded again of the important role they can play in the mutual aim to bring voluntary prepaid hospital-medical and surgical care within the reach of every Minnesotan. Without utmost support and enthusiasm no amount of public relations effort can affect the substantially increased non-group enrollment needed to justify the most intensive campaign we have ever conducted.

Through daily contact with the public, doctors and hospitals are in a position to reach potential non-group subscribers at the grass roots level; and full co-operation in supplying patients and visitors with literature, applications and full information will go far to assure a successful enrollment.

Throughout the lengthened eight-week enrollment period, which commenced September 9 and continues through October 31, the enrollment campaign has the additional support of the powerful medium of television.

A new half-hour Blue Cross-Blue Shield television program over WCCO-TV (channel 4) is being broadcast every Tuesday night at 9:30 p.m. The program arranged in co-operation with the University of Minnesota is called "The Golden Gopher Cavalcade," and it

features outstanding University of Minnesota football classics through the years from 1932 to the present, narrated in play-by-play fashion by the popular sportscaster Rollie Johnson. This timely presentation has already demonstrated universal public appeal, and is building greatly increased interest in Blue Cross and Blue Shield enrollment throughout the fifteen county television area in and surrounding the Twin Cities.

WCCO-CBS radio continues to reach out to the public on a state-wide basis, with four, fifteen-minute broadcasts per week on Tuesday and Thursday nights at 6:30 p.m., on Saturday night at 10:00 p.m., and on Sunday night at 7:00 p.m. In addition, during the latter half of the non-group campaign in October, newspaper messages are appearing in the *Minneapolis Star-Tribune, St. Paul Dispatch-Pioneer Press, Duluth Herald News-Tribune* and twenty-four out-state dailies.

To date, the new $25 deductible Blue Cross non-group contract with its more comprehensive benefits is enjoying gratifying public acceptance as is the new non-group Blue Shield contract, which offers increases in the schedule of payments, number of days care and other added benefits *to become effective on and after October 1, 1952.*

Armstrong, M.D., Clinical Instructor in Medicine, Stanford University School of Medicine. 380 pages. Illus. Price $2.50, flexible cover. Los Altos, California: University Medical Publishers, 1952.

The seventh edition of this useful little handbook has now appeared. It is a compact, ready-reference, pocket-sized book which wastes not an inch of space. Even the insides of the covers are utilized for tables and their edges are marked off in inches and centimeters so that they may be used for measuring.

Its aim, as stated in its preface, is to offer "a readily available source of factual data, laboratory procedures, and clinical aids repeatedly used in all branches of medicine." And so it does.

A comparison of this edition with the previous edition reveals some revision. The chapter on surgery has been rewritten and the chapter on the electrocardiogram has been revised. Many little, up-to-date bits of information and revisions are scattered throughout; and some of the illustrations have been redrawn.

It is the type of book which the doctor will find valuable to have on hand for quick reference and review.

LACTUM

Mead's liquid formula made from whole milk and Dextri-Maltose

AS NUTRITIONALLY SOUND...

The generous milk protein content of Lactum provides for sturdy growth and sound tissue structure. Dextri-Maltose® supplements the lactose of the milk so that energy needs may be met, fat properly metabolized, and protein spared for its essential functions.

For more than 40 years, milk and Dextri-Maltose formulas with the approximate proportions of Lactum have been used with consistent clinical success. Infants fed Lactum* show good tolerance of feedings, low incidence of digestive disturbances and infections, satisfactory growth response and a generally excellent picture of health and development.

*Frost, L. H., and Jackson, R. L.: J. Pediat., 39:585-592 (Nov.) 1951

AS IT IS CONVENIENT

Mothers appreciate the ease of Lactum's simple 1:1 dilution. It assures accurate measurement. Lactum is ideal also for supplementary and complementary feedings, and whenever single feedings are indicated.

Simply add 1 part Lactum... to 1 part water... for a formula supplying 20 calories per fluid ounce.

ADRENALIN
CHLORIDE
SOLUTION
1:1000

Introduced to the medical profession by the Parke-Davis Research Laboratories in 1901, ADRENALIN's notable versatility has made it one of the most widely used drugs in clinical practice. ADRENALIN is a standby for relieving asthmatic paroxysms, for treatment of protein shock, angioneurotic edema, cardiac arrest, and other medical or surgical emergencies. Among its many other important uses are: control of hemorrhage; prolongation of local anesthesia by delaying absorption; relaxation of uterine musculature; and reduction of intraocular pressure, vascular congestion and conjunctival edema.

FINANCIAL WORRY

We hope that you will never have to use what we have to offer for sale. Strange, isn't it. But to view it from a different angle we certainly have no desire to see you have a misfortune such as a fire—a robbery—an accident or some sickness. Yet the law of average is moving your way. The really strange thing is that few people do what they should to eliminate worries over financial loss. Just check yourself.

This misfortune might never happen to you. But isn't it wise to put away a little money each year into a plan of Accident and Health Insurance that has been critically investigated by your Association so that you won't have to worry about financial loss?

Delay offers no advantage!

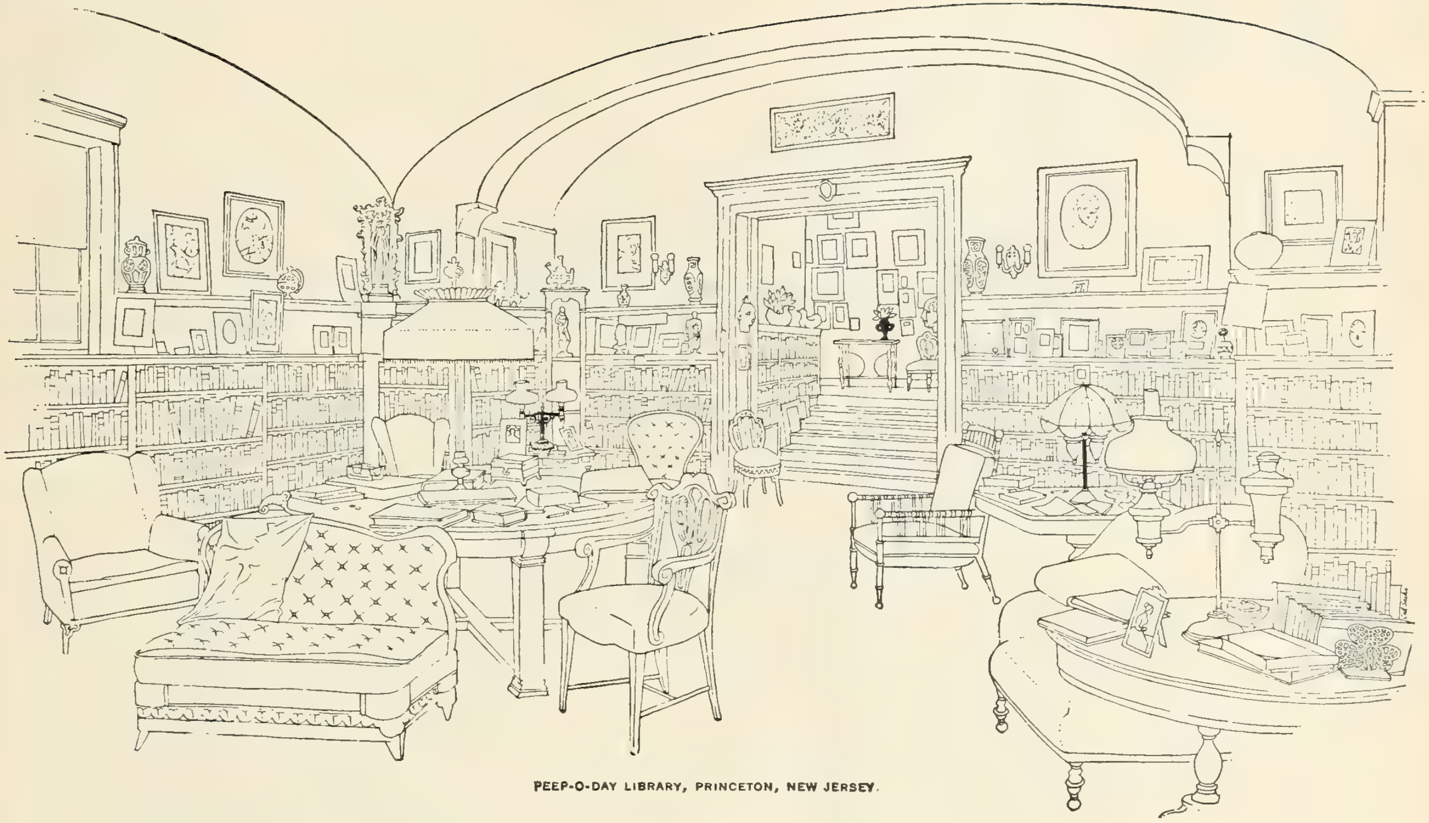
New aureomycin minimal dosage for adults—four 250 mg. capsules daily, with milk.



PEEP-O-DAY LIBRARY, PRINCETON, NEW JERSEY.

a low cost antibiotic in the broad-spectrum field is

AUREOMYCIN

Hydrochloride Crystalline

because

Low dosage of aureomycin has very frequently been reported in the literature to be entirely effective.

Small amounts of aureomycin may reduce disability, or hospital stay, to a few days.

Early use of aureomycin may forestall those failures that have been reported in the literature following penicillin and streptomycin.

The proven range of clinical usefulness of aureomycin is so wide that, when clinical diagnosis is established, prolonged and costly laboratory studies are largely unnecessary.

Capsules: 50 mg.—Vials of 25 and 100.
100 mg.—Vials of 25 and bottles of 100.
250 mg.—Vials of 16 and bottles of 100.

Ophthalmic Solution: Vials of 25 mg.; solution prepared by adding 5 cc. distilled water.

Meat...

and its Wide Clinical Applicability

That meat is an important component of the high protein diet[1] employed in the treatment of many pathologic states is evident from the following dietary suggestions that have been recommended by some authorities in the field of nutrition:

Protein of good quality and in adequate amounts is the most effective dietary agent for protecting the liver from damage and for promoting its repair.[2] In the long-term management of chronic liver disease, a suggested diet includes at least 4 ounces of lean lamb, veal, or beef in both the noon and evening meals.[3]

Among the nutritional needs of patients with chronic ulcerative colitis is protein.[4] For such patients a recommended diet includes 4 ounces of tender meat with luncheon and with dinner.[5a]

In diabetes mellitus, maintenance of protein reserves is important for supporting well-being and vigor, for maintaining resistance to infection, and, in conjunction with good general management, for minimizing many of the degenerative changes commonly seen in this condition.[6,7] One ounce of bacon at breakfast and 2½ ounces of cooked meat at each of the other two meals are valuable in a diabetic diet.[5b]

A program of treatment[8] found useful in atherosclerosis of the coronary vessels includes an adequate diet low in fat (20-25 Gm. daily) and normal or moderately high in protein (60-100 Gm. daily), in conjunction with lipotropic agents. A sample menu of this diet lists 2 ounces of lean meat at both the noon and evening meals.

Underweight or average weight patients with persistent low blood sugar levels are benefited by a high protein diet providing meat two or three times a day.[9] In overweight patients of this type, lean meat is served at luncheon and at dinner.

During convalescence from infectious disease, the importance of "high protein-high calorie" diets including generous servings of meat deserves emphasis.[10] For this purpose, a suggested typical daily menu schedule which results in weight gain, improved vigor, and a restored sense of well-being furnishes ½ ounce of bacon at breakfast and 3 ounces of meat at each of the other meals. Supplementary feedings may include additional amounts of meat.

60% Protein

. . . . yet as delicious as any milk beverage

A mixture of milk protein concentrate, soy protein, whole egg powder, powdered sugar, and flavoring, H. P. S. Sixty provides

Protein	60%
Fat	1.5%
Carbohydrate	27%

This high protein dietary supplement is outstanding in palatability. Its biologically complete proteins are intact, hence it is not burdened by objectionable taste or odor.

H.P.S. Sixty provides 3.6 calories per gram, 102 calories per ounce.

Prepared with water according to directions (6 oz. water, 1½ oz. H.P.S. Sixty), three daily servings (three 6 oz. glasses) provide 77 Gm. of protein; prepared with skim milk, three glasses provide 96 Gm. of protein; with whole milk, 95 Gm. of protein.

Valuable for use when the protein intake must be increased by the oral route and when whole protein can be utilized, as in undernutrition, peptic ulcer, hepatitis, chronic diarrheal states, pregnancy and lactation, and following burns and other conditions which raise the protein need.

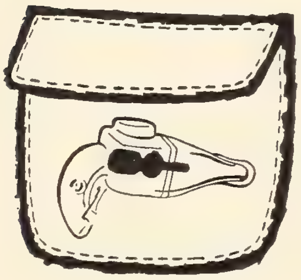
Always ready to abort the Bronchospasm



easy to carry…
in pocket or purse

WITH THIS quick-acting bronchodilating powder, it is now possible for many chronic asthmatics to lead useful, happy lives. When the asthmatic feels a bronchospasm impending he can merely take three or four inhalations of NORISODRINE Sulfate Powder and the attack usually subsides at once.

The patient carries this therapy with him. He uses the AEROHALOR, Abbott's handy, smoke-it-like-a-pipe powder inhaler. No need to leave the job, no injections no cumbersome equipment.

Clinical investigators[1,2,3] have found NORISODRINE effective against both mild and severe asthma. The drug is a sympathomimetic amine with a marked bronchodilating effect and relatively low toxicity. With proper administration, side-effects are few and usually minor.

Before prescribing this potent drug, however, the physician should familiarize himself with administration, dosage and precautions. Professional literature may be obtained by writing Abbott Laboratories, North Chicago, Illinois. Abbott

Norisodrine®

SULFATE POWDER

In early Rheumatoid arthritis

to increase and accelerate the appearance of remissions

"Gold salts, if administered during the first year of rheumatoid arthritis, increase and accelerate the appearance of remissions."* A remission rate of 66 per cent was recently noted in a group of gold-treated patients with rheumatoid arthritis of 12 months or less duration. Similar patients treated without gold showed a remission rate of only 24.1 per cent. On the average, remissions appeared 10 months sooner in the gold-treated cases.

POWDER FORM

Recommended for Complemental and Supplemental Infant Feeding
BAKER'S
MODIFIED MILK
HOMOGENIZED
ESPECIALLY PREPARED FOR INFANT FEEDING
Powder form
For the Bottle-fed Baby
THE BAKER LABORATORIES, INC.
CLEVELAND, OHIO

The *powder* form of Baker's Modified Milk is suggested for complemental and supplemental feeding because:

1. The powder form may be safely used for an indefinite time after the can has been opened.

2. Individual feedings may be prepared as needed—without the loss of the remainder of the can's contents.

3. Because of the similarity of its fat chemistry to that of human milk fat and its zero curd tension in the stomach of the infant, Baker's is well-tolerated when used as a complemental or a supplemental feeding.

4. Since Baker's powder and liquid are identical except for their physical form, feedings for the infant whose present formula is Baker's Modified Milk *powder* may be changed later to Baker's *liquid* without subjecting the baby to any changes in fat chemistry, protein, mineral balance, etc.

Because of its fat composition, relatively high protein content and extreme flexibility, Baker's Modified Milk powder is especially well-tolerated by the newborn and is particularly helpful in feeding the premature infant.

Both powder and liquid are prepared from high-quality milk* and contain adequate amounts of all known recommended vitamins (except C) as well as sufficient iron ammonium citrate to supply 7.5 milligrams of iron per quart of normal dilution.

Baker's Modified Milk powder is available in one-pound cans. One pound of powder makes approximately four quarts of formula of normal dilution.

Baker's products are ethically promoted and ethically distributed.

*** Made from Grade A milk (U. S. Public Health Service Milk Code) which has been modified by replacement of the milk fat with animal and vegetable oils and by the addition of carbohydrates, vitamins and iron.**

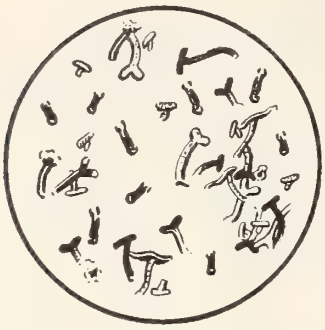
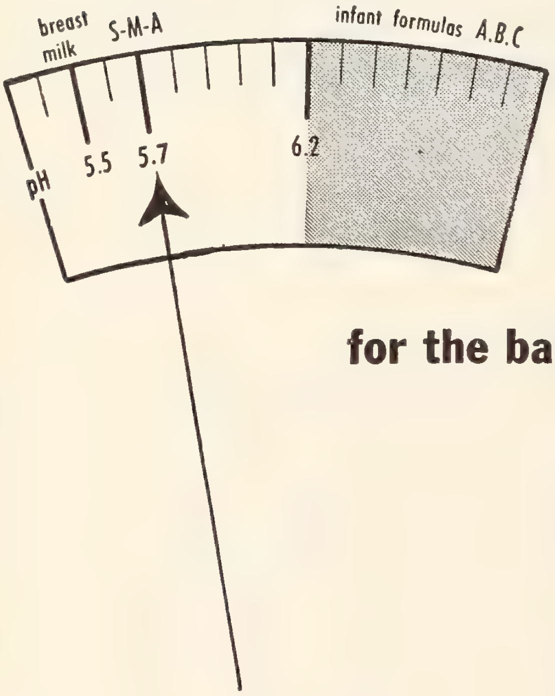
'TOLSEROL' (REG. U. S. PAT. OFF.) IS A TRADEMARK OF E. R. SQUIBB & SONS

SQUIBB

clinical tests show **S-M-A**® is the only infant feeding formula that



- establishes a predominantly gram-positive flora—similar to the flora of the lower intestine of the breast-fed baby.[1]



- produces a stool with a pH "practically identical" with that of the infant fed human milk. Stools of babies fed other formulas are distinctly more alkaline (6.2 to 6.7).[1]

for the baby **S-M-A** means:

1 *Better absorption of minerals, especially calcium.*

2 *Lower incidence of constipation.* Formation of calcium soaps is inhibited; acid produced by fermentation stimulates peristalsis.

3 *Lessened susceptibility to diarrhea.* Lactobacilli inhibit overgrowth of 'colon' group bacilli.

4 *A stool typical of the breast-fed infant*—having a "buttermilk-like", rather than putrefactive odor.

5 *Vitamins more readily available, especially vitamin* B_{12}. Growth of putrefactive organisms which reduce amounts of vitamins available[2] is inhibited.

6 *Minimal danger of perianal dermatitis and diaper rash in the new-born.*[3]

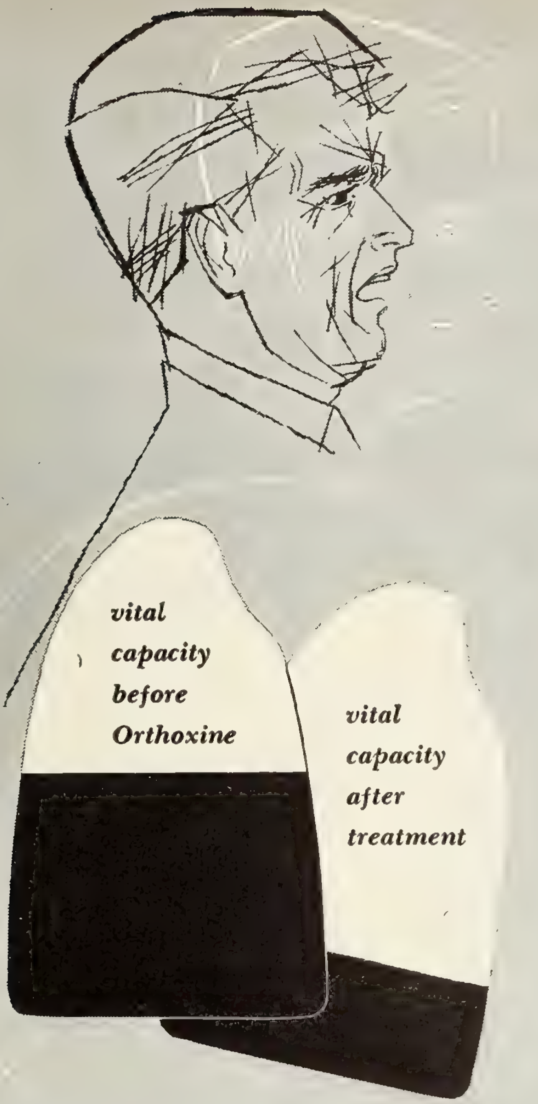
Wyeth®



vital capacity before Orthoxine
vital capacity after treatment

an answer to asthma

Q. Is there a sympathomimetic agent that will give relief from asthma without causing vasopressor and psychomotor stimulation?

A. Orthoxine Hydrochloride provides bronchodilatation with minimal vasopressor and psychomotor stimulation. By modifying the configuration of a sympathomimetic amine molecule, the action of Orthoxine has been centered mainly upon bronchodilatation, thereby minimizing side-effects arising from vasopressor or psychomotor-stimulating activity.

Doctor,
be your own
judge...
try this
simple test

With so many claims made in cigarette advertising, you, Doctor, no doubt prefer to judge for yourself. So won't you make this simple test?

Take a PHILIP MORRIS and any other cigarette

1. Light up either one first. Take a puff—get a good mouthful of smoke—and s-l-o-w-l-y let the smoke come *directly* through your nose.
2. Now, do exactly the same thing with the other cigarette.

You will notice a distinct difference between PHILIP MORRIS and any other leading brand.

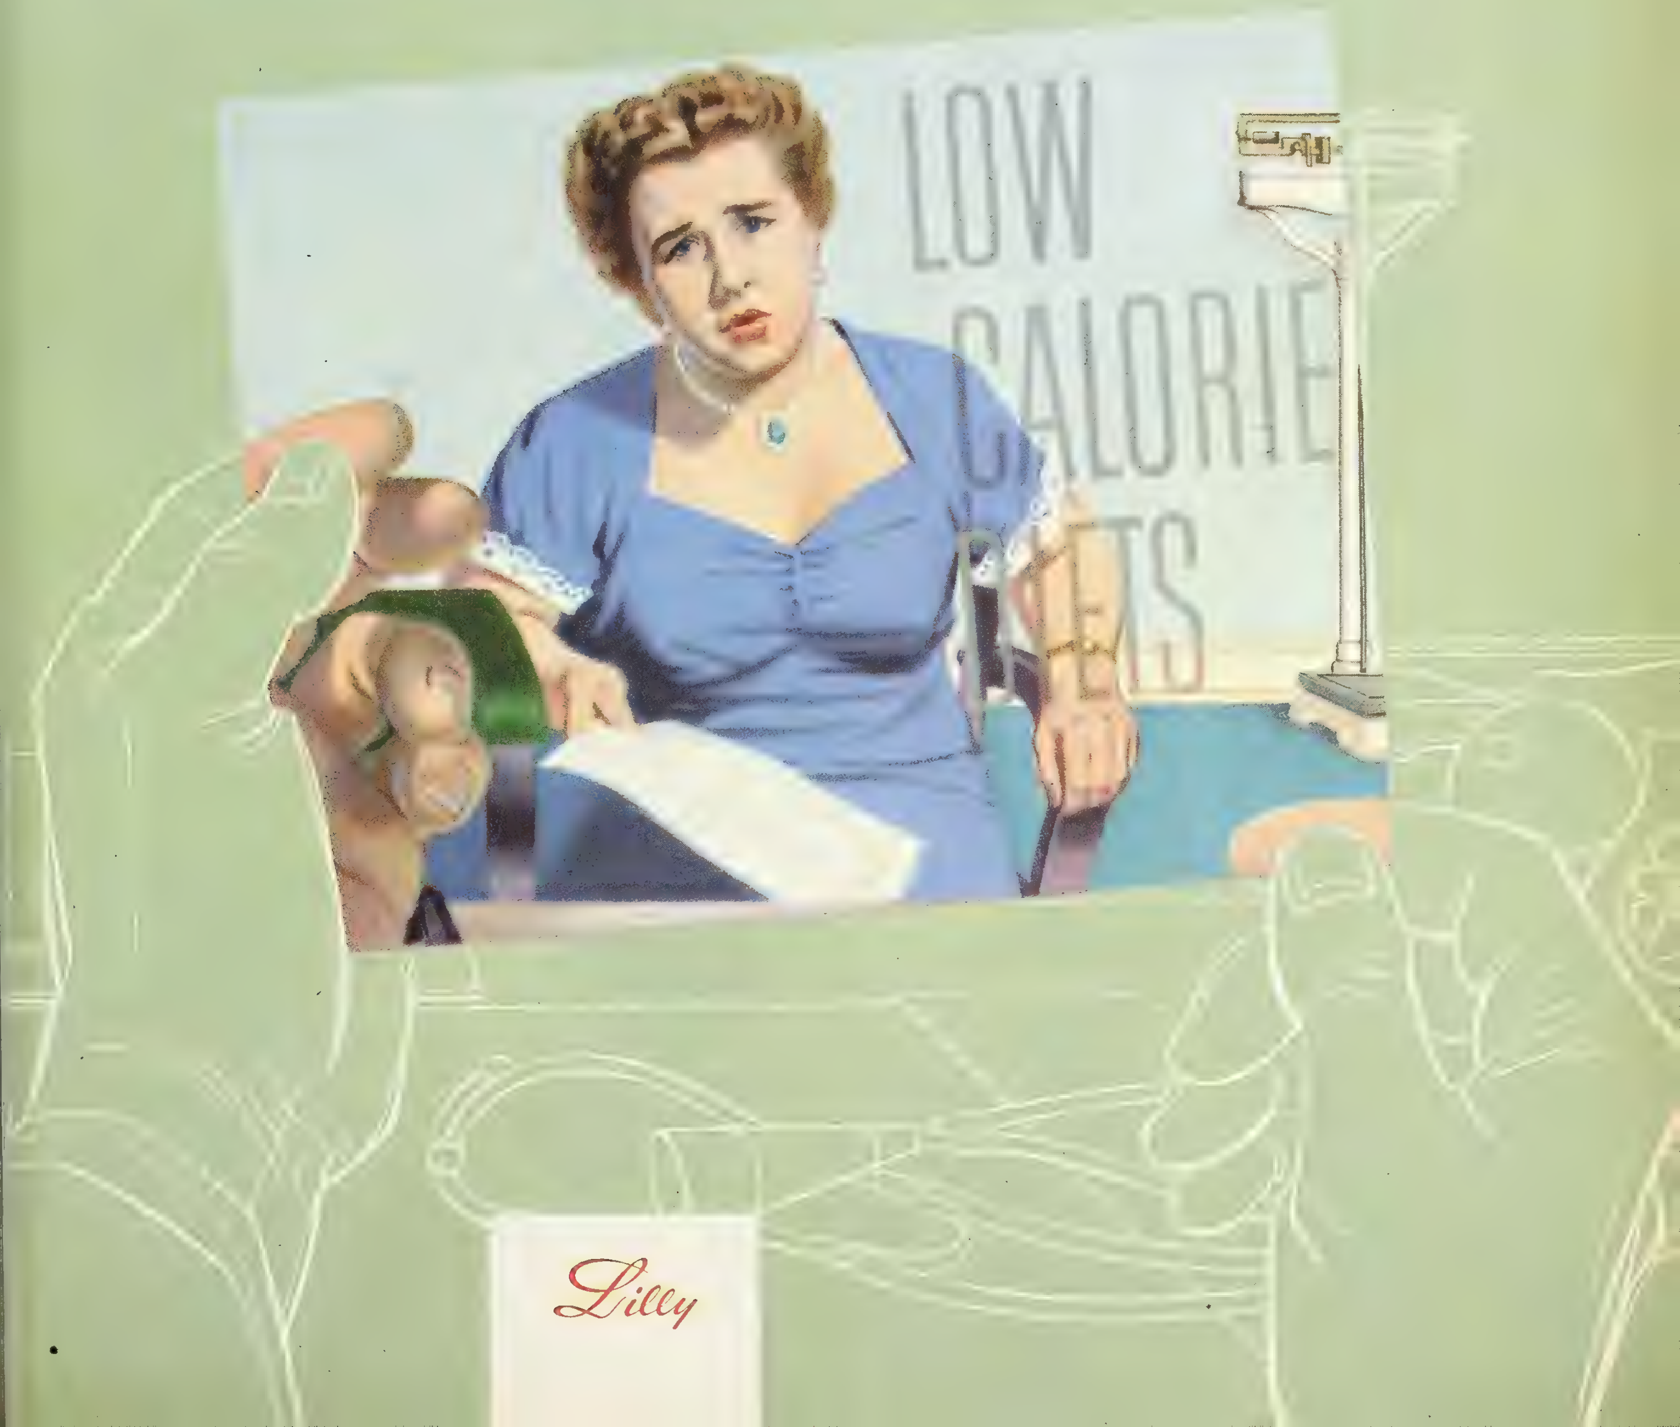
PHILIP MORRIS

Philip Morris & Co. Ltd., Inc., 100 Park Avenue, New York 17, N. Y.

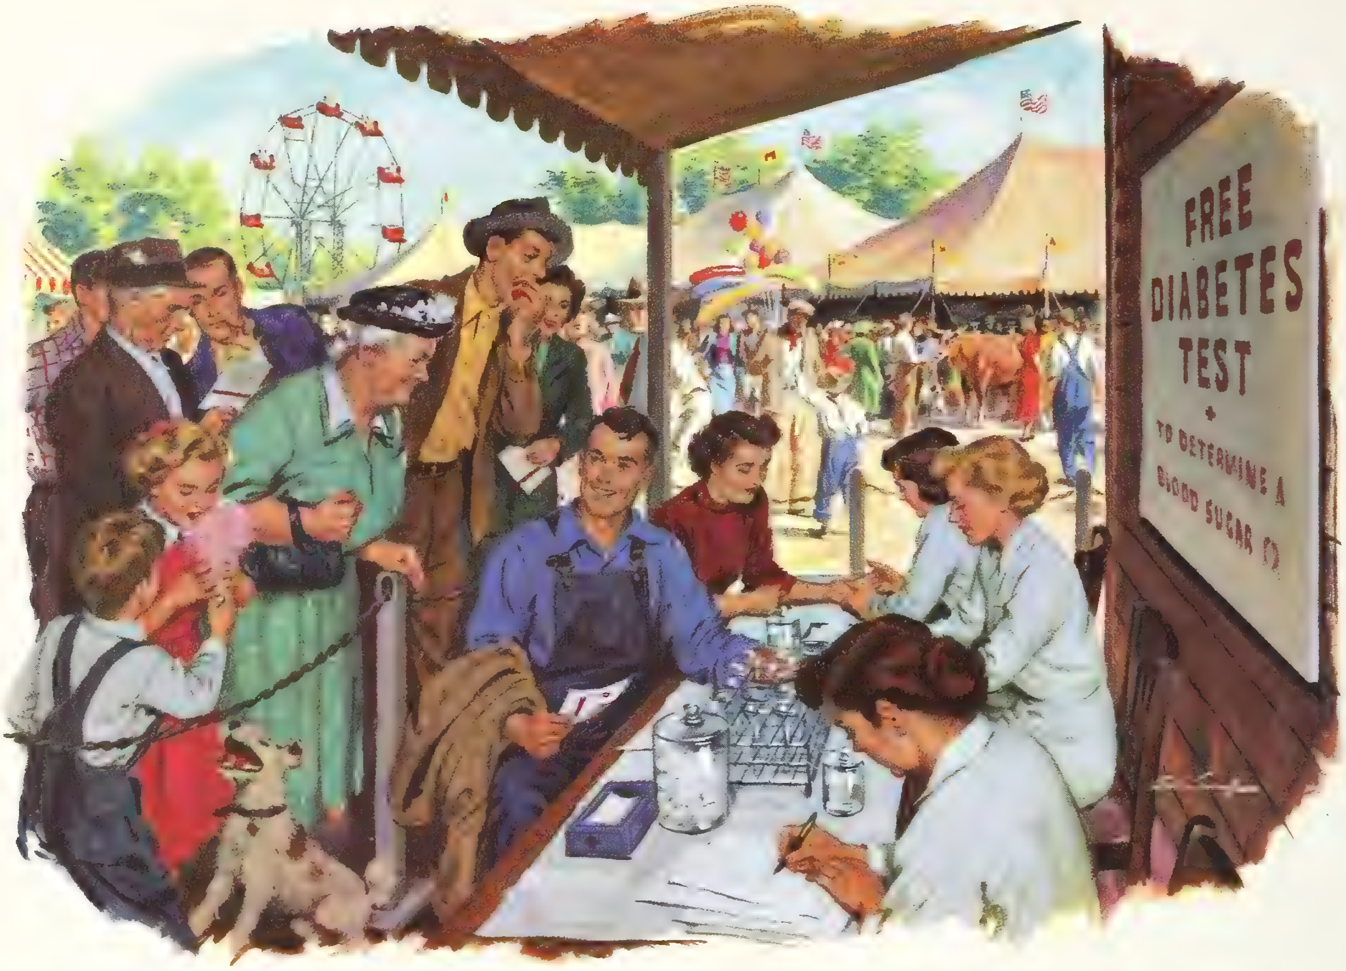
Dismayed as she is at the thought of existing without candy and desserts, she is likely to adhere to his diet instructions, for Dr. Harris has a way of encouraging trust in his medical opinion.

Likewise, he has reliance in others whose performance has proved their dependability. He especially favors those who, like himself, go well beyond ordinary demands to serve humanity. That is one reason why he likes to prescribe the products of a pharmaceutical company which is engaged in . . . →

"But Doctor Harris, no sweets?"



Lilly



. . . additional services for diabetics

Aside from having pioneered in the production of Iletin (Insulin, Lilly), Eli Lilly and Company has assumed other wide responsibilities in connection with diabetes. An extensive research program has not only served in the development of improved Insulin preparations but has aided in the dissemination of much significant clinical information. In collaboration with others, a quick, simple, and accurate method of screening blood specimens for the presence of abnormal levels of sugar has been developed. Large-scale diabetes detection has been facilitated. Handbooks, diet sheets, and emergency instruction cards are among the many complimentary services which Eli Lilly and Company is pleased to furnish to physicians as aids in the care of their diabetic patients.

MODERN TRENDS IN THE TREATMENT OF GOITER

JAMES J. COLL, M.D.
Duluth, Minnesota

THIS BRIEF presentation represents a survey, necessarily personalized, of current thinking on the subject.

Primary Hyperthyroidism (Exophthalmic Goiter, Graves' Disease)

The fundamental defect in this disorder remains undetermined. The wise physician will make those personal and environmental readjustments that seem indicated while directing the course and follow-up of therapy aimed at the thyroid gland. He realizes that while present-day therapy is successful, thyroid dysfunction is probably not the primary defect and that a definite recurrence rate exists. The longer any large series is followed the greater will be the incidence of recurrence.

The last ten years have witnessed the introduction of two new means of therapy—radio-active iodine and anti-thyroid drugs. Control can now be achieved by: (1) medical management with radio-active iodine; (2) medical management with anti-thyroid drugs; (3) subtotal thyroidectomy after preoperative preparation with anti-thyroid drugs, iodine and an adequate program of diet and rest.

Radio-active iodine seems, after a ten-year follow-up, to induce a remission of the same type and permanence and in the same percentage of patients with exophthalmic goiter as does subtotal thyroidectomy.[12] It has the following additional advantages:

1. It can be given in a drink of water.
2. The discomfort and expense of operation are obviated.
3. The prolonged use of medicine is not necessary.
4. The two major complications of thyroidectomy—parathyroid tetany and vocal cord paralysis—are avoided.

At the present time two distinct disadvantages restrict its use: (1) the possible hazard of late carcinogenesis and around this revolve all the disadvantages inherent in the unknown; (2) the expense of the apparatus and the personnel necessary for the use of the material, as well as its relative unavailability except in the major centers. In addition, there is some danger to the severely toxic patient in the exacerbation occasionally seen in the first few days after treatment. This is thought to be due to the release of hormone from the damaged thyroid cells.

The hazard of excessive irradiation is known, but how this applies to the dosage range of radio-active iodine and the thyroid gland remains unknown. Widely different opinions are held by well qualified men.[6] The data upon which to base an accurate judgment are not available at the present time and will only be available after approximately another decade of careful follow-up of patients who have been so treated. On the basis of the known development of malignancy in other tissues with the use of other types of irradiation, it does seem likely that fifteen to twenty years would be the expected time lapse. With this in mind, the use of radio-active iodine in the treatment of patients with a life expect-

ancy that falls within this range appears to be justified.

Anti-thyroid drugs—propylthiouracil, methylthiouracil, iodourocil, tapazole, et cetera—have been in use since 1943. Of this group, propylthiouracil seems to have the lowest toxicity,[3] and to have the additional advantage of the widest trial. Cope[6] in his review of the subject makes the statement that there is no proved case of hyperthyroidism in which the goiter has not eventually responded with an ultimately normal metabolic rate, provided that the drug is given regularly, persistently and in large enough doses. It has been shown in a well controlled series[15] that with a dose of 250 mg. daily, only one-half of the patients obtained an adequate response. With 300 mg. daily, 95 per cent of the patients were effectively treated, and with 400 mg. all the patients in the group responded. The drug seems to be safe if the patient is warned to report immediately to the physician any rash, fever or sore throat that develops. The average recurrence rate after such therapy has been about 50 per cent. In selected patients, Graves' disease with small to moderate sized glands (not postoperative recurrences)—a maintained remission has been reported in 75 per cent with a follow-up of two years or less.[10] This therapy avoids the disadvantages associated with operation and its complications and with the unknown carcinogenetic possibilities of 1 in 131. It is the only mode of treatment which leaves the patient with an intact thyroid gland.

The disadvantages of the anti-thyroid drugs are: (1) the high recurrence rate which is roughly 50 per cent after only a few years' follow-up; (2) the need for treatment over a period of six to twelve months. Inherent here, of course, is the difficulty of keeping many patients under surveillance for this period of time and, in addition, the necessity for close post-treatment follow-up because of the high recurrence rate.

At the present time it seems to be the consensus that the best method of treatment in most instances remains subtotal thyroidectomy, after adequate preoperative preparation. It possesses all the advantages of the known and sets a good standard for therapeutic results that new therapies must meet. The mortality rate in leading centers with this treatment has dropped to 0.1 per cent. The disadvantages remain: (1) the need for an operation with its attendant discomfort, expense and occasional danger; (2) the occurrence of the two major complications, parathyroid tetany and vocal cord paralysis, both of which continue to appear in about 1 per cent of the patients, even in good hands.

It seems that the anti-thyroid drugs have their greatest field of usefulness as a means of preoperative preparation.[4] Some physicians use them in controlling only those patients who have the disease in severe form preliminary to subtotal thyroidectomy or radio-active iodine administration. Others employ them routinely. With their use the dreaded crisis or thyroid storm has virtually disappeared, as has the need of staged operations for the complicated thyrotoxic patient. Whether the routine or selected use is most efficacious cannot be determined until large series have been observed over a longer period of time. These steps are usually followed:

1. Propylthiouracil, 300-500 mg. per day, in two or three divided doses until the metabolic rate is normal and normal weight approximated. Supportive measures include: high protein, high calorie, high vitamin diet and regulated rest.
2. Iodine is given from the beginning until operation or during the last few weeks prior to operation.
3. The patient is to report fever, rash, or sore throat at once.
4. Propylthiouracil is discontinued one week prior to operation to avoid a possible drug reaction during the immediate postoperative period.
5. Observation with basal metabolic rate and cholesterol determinations for one or two days before operation.
6. Operation only when the patient is perfectly normal.

Toxic Nodular Goiter

Opinions seem practically unanimous that the treatment of choice for toxic nodular goiter is adequate preoperative preparation with one of the anti-thyroid drugs, iodine, diet and rest, followed by subtotal thyroidectomy. This procedure with an operative risk of 0.1 per cent removes the goiter (and allows for its inspection by a pathologist) which statistically has a 1.0 per cent incidence of malignancy. Recurrent hyperthyroidism here is not expected. In the younger patient who refuses operation, control of the disease over a period of one year with one of the anti-thyroid drugs and iodine would seem best. However, the goiter remains and a recurrence rate of 50 per cent or better can be expected in two years. The patient who is a very poor risk because of associated disease, or the patient who has only a short life expectancy, can be controlled with one of the anti-thyroid drugs and iodine with or without subsequent radio-active iodine. Radio-active iodine, at least at the present time, seems to be contraindicated in the younger patients with toxic nodular goiter because, first, larger amounts of radio-active material are needed to control a given degree of hyperthyroidism in this type of goiter, and thus there is an increased possibility of malignant degeneration due to radiation, and secondly, the patient has a *nodular* goiter with its own hazard of malignant change.

Non-toxic Nodular Goiter

1. Solitary nodules. There seems to be fairly general agreement on a malignancy rate of approximately 20 per cent in this entity.[5,7] Because of this, operative removal is necessary. If malignancy is present, isolateral lobectomy together with a careful search for, and removal of, any suspicious lymph nodes in the drainage area is the only sane approach. If indicated, a radical neck dissection should be carried out. The majority of these malignancies are of low grade so that a thorough procedure initially provides an excellent outlook. The patient should be followed at six-month intervals for at least ten years with the object of surgically removing any further lymph nodes that might appear. Recurrent nodes after twenty years have been reported. We are following one patient with recurrent nodes twenty-two years after her initial surgery. Inadequate primary surgery leads to distant metastasis or, more commonly, local recurrence with or without local invasion and all the difficulties inherent in re-entering the scarred-up site of previous surgery.

2. Lateral aberrant thyroid tumors are now generally recognized as metastases from a primary tumor in the isolateral lobe which necessitates a hemithyroidectomy in addition to the lymph node dissection, even though a palpable tumor in the thyroid is not present.[5,9]

3. Multiple nodules. The incidence of carcinoma in this group varies from a few per cent to as high as 12.8 per cent, depending on whose data you accept.[5,7,11,13] I do not quite know what to make of these statistics. We see a large number of nodular goiters in this area and it is difficult to imagine finding more than 10 per cent of them harboring carcinoma if they were all routinely removed. We have on one hand the large number of multiple nodular goiters seen, and on the other hand the relative rarity of clinical carcinoma of the thyroid developing in such patients. There certainly must be a vast statistical difference between the incidence of carcinoma of the thyroid as judged by microscopic examination and clinical carcinoma of the thyroid as evidenced by extension beyond the confines of the gland or as a cause of death. Admittedly the problem of the pathologist is dfficult for obvious lymph node metastasis may look like normal thyroid tissue and the variety of local changes seen in the thyroid are difficult to assess. The need for correlation of the clinical and pathological evidences is certainly real. It should be remembered that excellent physicians a few years ago reported thirteen out of fourteen parathyroidomata as carcinomatous.[2] This may be true by their histologic criteria, but clinical carcinoma of the parathyroid is exceedingly rare, as judged by recurrence, extension or metastasis in a large series of parathyroid tumors followed over a period of many years.[1] An analogous situation perhaps confronts us in many instances in the thyroid gland. Oschner et al[5] argue logically that they are unable to differentiate carcinoma of the thyroid from benign nodular goiter in at least half of the cases, and that until it is possible to diagnose such carcinoma early by clinical means it must continue to be treated by the best weapon available—"prophylactic thyroidectomy." There is no doubt but that the mortality rate from prophylactic thyroidectomy is a great deal lower than the lowest current figure for the incidence of carcinoma in these glands, as reported frm surgical specimens. However, I continue to wonder about the need for wholesale surgery based alone on the reports from surgical pathology when we see death come to so few people from carcinoma of the thyroid. The argument has been raised that these patients die at home or at some distant center unknown to their physicians. We need better data to prove it.

There is one other attitude that bears on this line of thought. That is the old suggestion that

40 per cent of these goiters become toxic, or that *all* multiple nodular goiters will become toxic if the patient lives long enough. Certainly if one believes this and believes the data on the incidence of carcinoma of the thyroid, there would seem to be very little argument against prophylactic thyroidectomy in any patient with a nodular goiter and a life expectancy of over ten to fifteen years.

Thyroiditis

According to Crile,[8] the three varieties: (1) subacute thyroiditis, (2) struma lymphomatosa (Hashimota) and (3) struma fibrosa (Riedel) are distinct entities and do not progress from one to the other.

Subacute thyroiditis during the acute phase reveals a pseudotuberculous appearance on biopsy similar to that seen in its most chronic form. In any form, operation is not required since the process is self-limited and is said to respond well to doses of x-ray too small to significantly alter thyroid function. In its chronic form and especially when one side is more predominantly involved, confusion with Riedel's struma has occurred. The differentiation is important as Riedel's struma is an irreversible process, will not respond to x-ray, and requires operation for relief of symptoms. The same may be said of carcinoma. If in doubt, biopsy should be carried out before x-ray treatments are started in a patient with clinical diagnosis of subacute thyroiditis, or before operation in suspected Riedel's struma.

Struma lymphomatosa simulates a multi-nodular goiter in a forty to fifty-year-old woman with hypothyroid tendencies. The diagnosis can be established by biopsy with a Silverman needle. Operation is not necessary as the goiter will respond to x-ray therapy and thyroid extract.

PUBLIC HEALTH SERVICE GRANTS AND FELLOWSHIPS

With publication of a new list, Public Health Service brings to just over $22 million the amount of money it has allocated for medical grants and fellowships within the last twelve months. The most recent tabulation, issued late in October, is for projects approved by the Surgeon General following recommendations made last June by the various National Advisory Councils to the Institutes of Health. In dollar value they amount to just over 13 million. Awards totaling $9.29 million were announced earlier in the year.

In the earlier total were included 143 fellowships, valued at $389,850; fellowships in the October, 1952, totals numbered 540 and were valued at $1,749,248. The latest assistance money was distributed among 1,211 investigators in twenty-one states, the District of Columbia, two territories and seven foreign countries.

National Cancer Institute allocated the largest number of fellowships and grants, 351 worth $2,457,871, while National Heart Institute distributed the most money, $3,464,898 among 338 projects. Totals for other Institutes were as follows: Microbiological, 160 and $1,296,843; Mental Health, 123 and $998,303; Arthritis and Metabolic Disease, 89 and $744,589; Neurological Diseases and Blindness, 91 and $720,910; Dental Research, 37 and $233,728; and non-categorical, 436 and $3,058,683.

NEW DRUGS IN THE TREATMENT OF HYPERTENSION

EDGAR A. HINES, JR., M.D.
Rochester, Minnesota

THERE ARE several new drugs which may reduce blood pressure in cases of essential hypertension. Some of these drugs are now available for general clinical use. Inasmuch as any of these drugs can produce serious reactions, every physician should become familiar with the accepted proper methods of administering them before he uses them in his practice.

The new drugs which I shall consider are as follows: newer veratrum preparations, particularly protoveratrine; sodium nitroprusside; dihydrogenated ergot alkaloids (hydergine); dibenzyline (688-A); hexamethonium (bistrium, C-6) and pentamethonium (C-5); 1-hydrazinophthalazine (apresoline, C-5968).

Newer Veratrum Preparations

Veratrum viride was one of the earliest drugs to be used in the treatment of hypertension. During the past few years better standardized preparations of veratrum have been available to the physician. This has revived the interest in veratrum in hypertension and toxemias of pregnancy. A number of these preparations are on the market and you are familiar with the use of most of them.

The response of the blood pressure and the patients' reactions to any of the veratrum preparations is variable from patient to patient and even at different times in the same patient on the same dosage. This makes regulation of dosage difficult and requires a carefully worked-out program and continued observation of the patient while taking these drugs.

One of the veratrum preparations most recently under intensive study is protoveratrine, a single-ester alkaloid of Veratrum album, the potency of which is expressed in micrograms. It is available for oral use in tablets, each of which contains 200 or 500 micrograms, or in a solution for intravenous use which contains 100 micrograms per cc.

It was hoped that this preparation would be effective by oral administration in a larger number of patients and that the dose could be more accurately administered than with the older veratrum preparations, thus widening the range between the hypotensive effects and the undesirable side-effects. It would seem from the studies reported that this has not been achieved. Protoveratrine is effective for long-term usage in only about one-third of patients with moderate to severe hypertensive vascular diseases. It has the same disadvantages as the other newer veratrum preparations.

Protoveratrine is useful when given intravenously, subcutaneously, or intramuscularly for the palliation of acute hypertensive crises such as hypertensive encephalopathy with headache, acute pulmonary edema, and toxemia of pregnancy with acute angiospastic episodes. It causes considerable local pain when injected subcutaneously or intramuscularly and if given in this way it should be combined with a local anesthetic, such as procaine hydrochloride.

Meilman has reported that protoveratrine, when administered intravenously, appears to be virtually specific for the headache, nausea, vomiting, insomnia, delirium, and coma of hypertensive encephalopathy, for the congestive failure of acute glomerulonephritis, and for the convulsions of toxemia of pregnancy.

For intravenous administration 1 cc. of the solution (100 micrograms) is diluted to 10 cc. with physiologic saline solution. The injection is given slowly and blood pressure is determined frequently. Administration is stopped when there is a satisfactory decline in blood pressure or relief of the symptoms of the hypertensive crisis. The usual dose administered intravenously is from 50 to 150 micrograms. Meilman advised administering 1.5 to 1.9 micrograms per kilogram of body weight.

Sodium Nitroprusside

According to Page this drug has been studied in the Research Division of the Cleveland Clinic for several years. It produces some interesting effects on the circulation and the blood pressure in animals and in patients with hypertension. In

---

Read in the Symposium on Therapy at the annual meeting of the Minnesota State Medical Association, Minneapolis, Minnesota, May 27, 1952.

From the Division of Medicine, Mayo Clinic, Rochester, Minnesota.

animals, when given intravenously in very small amounts, it causes a marked fall in blood pressure and vasodilatation in the kidneys. These changes are not dependent on the nervous system.

The immediate effect apparently requires the action of the whole nitroprusside radical. Inasmuch as after a time much of this radical is converted to thiocyanates, the persistent effects may be due to the same effects as those obtained by the administration of thiocyanates. At the Cleveland Clinic the drug has been given orally to a group of patients with hypertension. Its long-term use must be controlled with periodic determinations of the blood cyanates.

The impression of the investigators who have studied this drug is that, although it has some of the properties of the thiocyanates, there is an additional effect which causes it to have a more impressive hypotensive effect than the thiocyanates. Further investigation will be necessary before it can be determined whether or not sodium nitroprusside has any real advantages over the usual method of administering thiocyanates to patients with hypertension.

Dihydrogenated Ergot Alkaloids (Hydergine)

The dihydrogenated ergot alkaloids (dihydroergocornine, dihydroergocristine, dihydroergokryptine) have a central sedative action and produce adrenergic blockage in the periphery. They also act centrally, causing stimulation of the vagal centers which induces bradycardia. This somewhat complicated action is said to cause vascular dilatation with increased peripheral blood pressure and a lowering of systemic blood pressure with bradycardia. The three alkaloids are combined in the preparation hydergine.*

Because of their blood pressure lowering properties the dihydrogenated ergot alkaloids have been used in the treatment of hypertension. Hydergine can be administered intravenously, intramuscularly, or subcutaneously. The unfavorable side-effects are minimal, consisting of nasal stuffiness and occasional nausea and vomiting when given intravenously.

The usual procedure is to give a test dose of 1 to 2 cc. (0.3 mg. to 0.6 mg.) of hydergine intramuscularly after establishing a basal blood pressure level. If there is a moderate but not a severe hypotensive response to this dosage, 1 to 2 cc. is given intramuscularly daily or every other day for a total of about forty injections. If there is no significant decrease in blood pressure with the test dose, the drug is unlikely to be effective in the long-term treatment of that patient.

Significant lowering of blood pressure has been reported to occur in from 25 to 65 per cent of patients with moderate to severe degrees of essential hypertension.[3,4] The development of tolerance has been reported in some cases on prolonged treatment. These drugs would seem most useful in the treatment of hypertensive crises induced by pheochromocytoma or hypertensive encephalopathy rather than in the long-term treatment of essential hypertension.

Dibenzyline (688-A)

Dibenzyline (N-phenoxyisopropyl-N-benzyl-B-chlorethylamine hydrochloride)** is a sympathicolytic and adrenolytic drug which may reduce blood pressure when administered orally or intravenously. It is most effective in reducing the elevated blood pressure resulting from pheochromocytoma, but may reduce blood pressure in cases of essential hypertension. It is less effective when given orally than when given intravenously. Bello and Soloff, in a small series of patients, found that dibenzyline, when administered orally, failed to reduce blood pressure in the hypertensive subject or to give any evidence of absorption. Allen and his associates also found that the oral administration of dibenzyline produced a much less dramatic reduction than intravenous injection.

Dibenzyline may be given slowly intravenously when diluted in 500 cc. of a 5 per cent solution of dextrose. The optimal total dosage is approximately 1 mg. for each kilogram of body weight. The reduction in blood pressure lasts two to nineteen hours. The intravenous administration of the drug is probably of less usefulness than the intravenous administration of protoveratrine in treating hypertensive crises, as untoward reactions frequently occur when dibenzyline is administered intravenously. The oral administration of the drug for long-term use in essential hypertension requires further study.

**Manufactured by Smith, Kline & French Laboratories, Philadelphia, Pennsylvania.

Hexamethonium (Bistrium,* C-6); Pentamethonium (C-5)

Hexamethonium, a derivative of the polymethyline ammonium compounds, inhibits the action of the autonomic nervous system by blocking the impulses at the ganglia. The effects are similar to those of tetraethylammonium chloride, but are of much longer duration. Pentamethonium is similar in action, but has been less extensively used than hexamethonium. It is usually administered in the bromide compound and may be given orally, subcutaneously, or intravenously. The effect of hexamethonium is more prolonged but probably not greater in degree if renal insufficiency is present, unless there has also been a lowering of sodium in the serum due either to the disease or to the intake of a diet which is low in sodium content. It is rarely necessary to administer hexamethonium intravenously, and if given in this way the initial dosage should be very small, probably not more than 1 mg. or less, as very serious hypotensive reactions may occur. The oral administration of the drug occasionally causes serious complications, and if it is administered orally, the patient should be kept under close supervision.

The subcutaneous dose of the drug is 15 to 200 mg. This dose should be administered every six to twelve hours, depending on the response of the blood pressure. Larger doses must be used when the drug is administered orally than when it is injected subcutaneously. It is agreed that the oral administration of hexamethonium is less effective in reducing the blood pressure than is the administration by subcutaneous injection.

The undesirable reactions which may result from injections of hexamethonium are severe hypotension, marked orthostatic hypotension, constipation, paralytic ileus, and difficulty in micturition. Severe hypotension is evidence of overdosage and should be treated by placing the patient in the recumbent position and by elevating the foot of the bed. It may be necessary to administer 2 to 5 mg. of phenylephrine hydrochloride (neosynephrine) intravenously if severe hypotension persists.

The complications, constipation, paralytic ileus, and urinary retention, may be prevented by the sublingual administration of 5 to 20 mg. of urecholine chloride (bethanechol chloride).

1-Hydrazinophthalazine

1-Hydrazinophthalazine was designated originally as C-5968,‡ and is now supplied as apresoline. It appears to reduce blood pressure by its action on the midbrain or hindbrain, and according to Schroeder[7] inactivates many pressor substances in the blood, such as pherentasin, hypertensin, and others. The dose varies from 50 to 150 mg., which should be administered orally three to five times daily.

Undesirable side-effects are headache, tachycardia, and severe orthostatic hypotension. Nausea and vomiting, paresthesias in the extremities, nervous tension, and mental depression may occur occasionally. The milder side-effects usually subside within three or four hours and require no treatment. Headache, if severe and prolonged, may be controlled by the administration of dimethyl-hydrinate (dramamine), or aspirin, and can be prevented by the prior administration of hexamethonium bromide.

1-Hydrazinophthalazine administered alone has been found to be an antihypertensive agent of only moderate potency. A significant reduction in blood pressure occurs in about 70 per cent of cases, but the blood pressure almost never is maintained at or near a normal level.

Administration of 1-Hydrazinophthalazine With Hexamethonium Bromide

Because of the reported difference in the mode of action of the two drugs, one acting predominantly peripherally and the other centrally or by inactivating pressor substances in the blood, it was logical to try a combination of these drugs. Some investigators believe that the most effective method now available for treating essential hypertension is by administering 1-Hydrazinophthalazine and hexamethonium bromide together or on an alternating dosage program. Others do not believe these drugs have a synergistic action.

Schroeder[7,8] has reported that this combined therapy resulted in complete control of the hypertension in all cases of benign hypertension and in all but two of thirty cases in the malignant stage without renal insufficiency. He had observed that too quick withdrawal of the drugs was associated with serious reactions and that these reactions had resulted in death within a few days or weeks after withdrawal in six patients. Schroeder stated that no tolerance to the drugs developed in patients after normal blood pressure had been established, or if the patient had been taking the drugs satisfactorily for more than a month. In the malignant stage, in which normal blood pressure levels are not usually attained with the drugs, tolerance may develop in the early weeks of treatment.

These two drugs have been used in a clinical study at the Mayo Clinic by Drs. Allen, Barker, Kvale, Shick, Estes and myself for the past eight months. We have obtained information sufficient to enable us to form an opinion as to the value of these drugs in the treatment of severe essential hypertension over a period of a few weeks or months, but not for longer periods.

Patients to whom these drugs are to be administered must be hospitalized for a minimal period of three weeks for preliminary observation and careful adjustment of dosage. We have treated patients with group three and group four essential hypertension less than fifty years of age, or patients with group two essential hypertension whose blood pressures are more than 200 mm. of mercury systolic and 120 diastolic. Patients with severe renal insufficiency have not been given these drugs.

The period of observation was begun with a pretreatment control period of from one to three days without the use of sedatives or other drugs. Treatment with hexamethonium bromide was started with a test dose of 15 mg. administered subcutaneously. The blood pressure of the patient was taken in the supine, seated, and erect positions several times during the first hour after the drug was administered, and any untoward reactions, especially marked orthostatic hypotension, were noted. If orthostatic hypotension was not severe, 15 mg. of hexamethonium bromide was given subcutaneously every twelve hours. The blood pressure was always taken before the next injection was given. If the blood pressure was lower than 130 mm. of mercury systolic, the next dose was omitted. If the blood pressure was not lowered, the dosage of hexamethonium bromide could be increased gradually to a total of 100 mg. over a period of two or three weeks.

Administration of 1-Hydrazinophthalazine, beginning with doses of 25 mg., was started six hours after the last injection of hexamethonium bromide. The initial dose should be no more than 25 mg. The dose was gradually increased up to a maximum of 200 mg. over a period of two or three weeks.

Most of our study was carried out by using the drugs concurrently. Hexamethonium bromide has been given subcutaneously at 6 a.m. and 6 p.m., and 1-Hydrazinophthalazine at noon and at midnight. The dosage of both drugs has been small at the beginning and has been gradually increased, depending on the side-reactions that occurred and on the patient's tolerance to the drug. Schroeder[8] has emphasized that to avoid the development of tolerance to the oral method of administration it is necessary to give the patient gradually increasing doses every day or every few days until the maximal effective dosage has been reached. We do not know whether or not such frequent increase in dosage is necessary if hexamethonium bromide is administered parenterally.

In general, we have been encouraged by the use of these drugs, particularly hexamethonium bromide, in the treatment of selected cases of essential hypertension. Subcutaneous administration of hexamethonium bromide produces a lowering of blood pressure in most cases and in many it produces a marked orthostatic hypotension with all the unpleasant secondary effects. These effects usually persist for three or four hours and usually become less noticeable as the injections are continued, even though the dosage is increased. We have observed the development of tolerance to the combined program in several patients within the first few weeks of treatment. 1-Hydrazinophthalazine seems to be less effective than hexamethonium bromide in the dosage we have employed. In many patients a high fixed elevation of blood pressure has become more labile in the lower ranges while they were taking the two drugs. In some cases the hypertension may be said to have been satisfactorily controlled on this program of treatment during the limited time of our observation.

Patients may be instructed to administer the medication to themselves and, unless they are under the closest observation of a physician, to take their own blood pressure so that they can properly regulate their dosage of medication.

One of the disadvantages of this program for the long-term treatment of hypertension is that it cannot be carried out satisfactorily unless the patient is intelligent and co-operative and can adequately control the administration of the drugs to himself.

TREATMENT OF THE CONVULSIVE DISORDERS

Z. R. MILLER, M.D.
Minneapolis, Minnesota

THE PRIMARY objective of this paper is to stress the importance of the physician's responsibility in the treatment of the convulsive patient and to enable the convulsive patient to live the fullest, happiest life possible. Concomitantly it is often necessary to reassure and educate both the patient and near relatives. Each "epileptic" represents a challenge to the practitioner not only to completely control the seizures but also to achieve adequate social and economic adjustment. Successful medical management must include personality adjustment where necessary and an integrative rehabilitation program. The word "epilepsy" to the layman's mind continues to precipitate erroneous and alarming ideas, reminiscent of folklore. A convulsion is so dramatic in its manifestations that it is little wonder that the ancients conceived an individual so afflicted to be inhabited by the devil. Descriptions of the "fallen evil" later modified to "falling sickness" are found in writings of the ancient Egyptians, Arabians, and Hebrews. Thomas Willis[1] in the Eighteenth Century likened the convulsive attack to the explosion of a gunpowder charge and stated that the final cause is chemical in origin, a conclusion upheld by present-day investigators.

The modern era for the investigation and research in convulsive disorders to great extent followed the introduction of the electroencephalogram by Hans Berger in 1929. The development of the EEG has revealed differences between epileptics and normals, has shown what is taking place in the brain during the seizure and between seizures, and has uncovered new evidence about causal lesions. Treatment of the convulsive disorders has paralleled the advance of electroencephalography. The instrument has opened up new avenues for investigation and provided the spark for stimulating research. The EEG, however, does not tell us much about normal cerebral physiology, and certainly does not tell us why some individuals with brain trauma, cerebral neoplasm, et cetera have a convulsion and others do not; nor why a certain percentage (10 to 15 per cent) of epileptic patients will have a normal interim EEG record; nor why some patients become clinically seizure-free whereas the EEG tracing may become more abnormal. Nevertheless, the brain-wave apparatus has given to the clinician tremendous information to aid in proper diagnosis, the type of seizure discharge, and thus tend to indicate the proper anticonvulsant medication. The observations made with the EEG have confirmed many of the deductions of the pioneer neurologists (Jackson,[5] Gowers,[2] and others) and have further extended the knowledge of the spread of seizure discharge over the brain. Present-day investigation is also concerned with the chemical alterations, as abnormal concentrations of acetylcholine, that take place in the epileptogenic focus, and the mechanisms by which the various anticonvulsants are effective.

Inasmuch as we do not fully comprehend the fundamental mechanisms underlying the convulsive states, no wholly satisfactory definition can be given. Most definitions are purely descriptive. Lennox (1944) defines it in a comprehensive fashion: "epilepsy is a recurrent disturbance in the chemico-electrical activity of the brain which manifests itself in a symptom complex of which impairment of consciousness, perturbation of the autonomic nervous system, convulsive movements, or psychic disturbances are the essential components."[8]

Epilepsy presents a social and economic problem of considerable magnitude, for its incidence is surprisingly high. There are approximately 800,000 people in the U.S.A. with a convulsive disorder, an incidence of one in 200. This is a conservative estimate, as in many cases seizures are overlooked, concealed, or incorporated with other diagnoses. The number of veterans[10] afflicted with epilepsy is approximately 50,000,

and it is expected that half of the 15,000 military men who survived penetrating brain injuries will develop post-traumatic epilepsy. The other social aspect of the problem of epilepsy is the hereditary element. Lennox[6] states that 17 per cent of the relatives of an epileptic patient had convulsions whereas the incidence of convulsions in normal families is 3.4 per cent. Lennox, Gibbs, and Gibbs[9] (1940) found that in a group of epileptics both parents had an abnormal EEG record in 28 per cent and with at least one parent in 94 per cent. These authors imply that the cortical dysrhythmia is inheritable, which may predispose the offspring to epilepsy. Williams[16] (1950) elaborates the hypothesis and believes that in addition to the tendency to epilepsy there must be another factor, that is the failure to prevent the spread of convulsive process. This limiting factor may be all important in preventing the clinical attack or in the alteration of the attack, thus giving use to the differences witnessed in the sub-types of the condition.

The practical aspect of the genetic factor presents itself when an epileptic patient asks for advice about having children. Barring all complications the incidence of having an epileptic child, wherein one parent only is a convulsive, is not much greater than the normal occurring incidence for epilepsy.

It is to be recalled that epilepsy is a syndrome whose presenting symptoms may vary from mild psychical states to severe status epilepticus. Every individual who has a convulsive attack warrants a complete medical and neurologic workup. A searching attack to uncover the etiology of the seizure discharge is of utmost importance in the proper management of the patient. If this be accomplished the diagnosis of so-called idiopathic epilepsy (essential, genuine) will not invariably be made, and the incidence of acquired (symptomatic) epilepsy will be surprisingly high. Nevertheless, it is true there will remain a large group of patients with no demonstrable organic pathology either by examination or by historical inference. The etiology of the epileptic patients seen by the individual practitioner to a large extent depends upon the physician's type of practice. Thus the neurologist and neurosurgeon will have a high incidence of brain tumors amongst their epileptics, the pediatricians a high incidence of brain trauma at birth, the state hospital superintendent a high incidence of congenital abnormalities and profound brain trauma, and the general practitioner more apt to see the normal ratio of genetic and sub-varieties of acquired epilepsy.

In addition to subdividing the convulsive disorders into the genuine (essential) or acquired etiologic groups, these disorders for purposes of diagnosis and treatment are classified according to the clinical type of seizure manifested by the epileptic. The vast majority of all seizures can be classified in one of six main groups. The classification is based primarily on the physical appearance of the patient during the seizure, but also in part on the EEG tracing. An observed seizure may be atypical or a mixture of two types, or may defy classification.

Type of Seizures

1. Jacksonian Motor Seizures, and Focal Motor Seizures.
2. Somatic Sensory Seizures.
3. Grand Mal (Generalized) Seizures.
4. Psychomotor or Psychic Equivalents.
5. Petit Mal Triad or Pyknolepsy.
6. Autonomic (Diencephalic) Seizures.

Anticonvulsive Therapy

As is true with all diseases the primary objectives of treatment are removal of the cause or causes, alleviate the symptoms, and prevent sequelae. Treatment falls into several main groups: (1) general; (2) psychological; (3) drugs; (4) dietary; (5) surgical.

General.—Experience has taught us that patients are less likely to have convulsions if they lead a well-balanced, equitable life. The epileptic should be directed to lead as normal an existence compatible with his type of seizures. Only such restrictions should be made that are necessary to safeguard the patient and the public. In this regard epileptic patients should not operate heavy machinery or drive automobiles until their seizures have been under complete control for at least several years. Every attempt should be made to correct incidental physical abnormalities and to keep the patient in good sound physical state. All types of alcoholic beverages tend to precipitate seizures and should therefore be absolutely forbidden. The only possible exception may be in the case of an elderly individual whose seizures are secondary to cerebral arteriosclerosis, and wherein an occasional drink increases cerebral circulation. The intake of non-alcoholic beverages by the young patients especially bears watching during the hot weather.

Psychological.—Proper mental hygiene is exceedingly important. Patients should not be shrugged off by merely administration of drugs. Most patients suffer more from the fear of seizures and social implications than from the seizure itself. The social stigma is still present even in this period of mental health enlightenment. This attitude is fostered by concealment by the patient's relatives, and the prevalent tendency that employers and educators have of getting rid of the epileptic from work and school. A great deal of restriction is introduced under the guise of safety. Patients and their families need to be protected from discouragement and this element of horror. Even though the physician cannot attain complete relief of seizures in every patient, he can inject and cultivate hope and morale in many. All questions relating to intellect, sanity, heredity, marriage, et cetera should be frankly discussed. The various myths and folklore pertaining to epilepsy should be exploded. It must be emphasized that the anticonvulsant drugs employed are neither "dope" nor habit forming. Clinical evidence indicates that in a number of patients anxiety, tension, fear, and the like may actually precipitate or increase the number of seizures. Important as psychological health is in the therapy of the epileptic it in itself cannot adequately control the seizure discharge. From the therapeutic point of view the greatest advances in therapy have come about through the introduction of new anticonvulsant drugs.

Pharmacotherapy of Epilepsy.—The recent increase in the number of anticonvulsants available has to a certain extent complicated the task of choosing the proper drug for the individual patient. A drug that may be effective for one type of seizure may be harmful for another; that is, a single drug may control petit mal and accentuate grand mal. The selection of medication depends primarily upon the type of seizure. Much time and grief can be eliminated by choosing the drug most likely to succeed.

Approximately 100 years have passed since bromides were first used in the treatment of seizures. Credit belongs to Sir Charles Locock,[11] who reported the use of bromides in 1857. The drug was introduced to treat onanism, which supposedly was the cause of the seizures. Considering the inadequacy of previous medications, the introduction of bromides was a tremendous therapeutic advance and received with ready acceptance and acclaim. Enthusiasm for the newer drugs has relegated and threatened to displace the bromides altogether. Nevertheless various studies (Pollock[14]) substantiate the effectiveness of the bromides when administered skillfully.

The next important milestone in the development of pharmacotherapy was the use of phenobarbital in 1912 by Hauptman.[4] However, it was not put to general use until after World War I. The first report in the American literature was that of Grinker's[3] in 1920, following which the drug received wide acceptance and innumerable articles were published heralding this new anticonvulsant.

Up until the mid 1930's it was the opinion that effectiveness of bromides and barbiturates was secondary to their sedative powers. Merritt and Putnam[15] reasoned that the protection offered by these drugs might be specifically anticonvulsant rather than hypnotic and in 1937 introduced Dilantin after an exhaustive study of approximately fifty various compounds. Dilantin (diphenylhydantoin sodium) was the least sedative and best anticonvulsant of the drugs tested. In June, 1938, before the AMA meeting in San Francisco, Merritt and Putnam[12] reviewed their clinical experience with Dilantin. In the decade following numerous other hydantoins were investigated and offered for clinical use. The most commonly used in addition to Dilantin are Mesantoin (methyl phenylethyl hydantoin) and Thiantoin (phenyl thienyl hydantoinate).

The use of the hydantoins together with barbiturates and bromides gave to the clinician an excellent combination for treatment of the major (grand mal) attack, but was disappointing in treatment of petit mal triad. Thus the search continued and in 1945 Lennox[7] reported on the effectiveness of Tridione (trimethyloxazolidine dione), and later Paradione (dimethylethyloxazolidine dione). Other new anticonvulsants have been available to the clinician, including the other hydantoins and recently Phenurone (phenacetyl urea).

We are still looking for the ideal anticonvulsant, one which should offer complete control against seizures, be equally effective against all types of seizures, and be free of side-effects. Williams[16] believes that the sedative anticonvulsants (barbiturates) protect the brain from the epileptogenic focus whereas the hydantoins directly inhibit the epileptic process without depressing the remainder of the cerebral cortex.

The chief pitfall in the treatment of convulsive disorders is failure to use the correct medication, or the failure to use a sufficient amount of the medication or medications.

Specific Drugs

Phenylethylbarbituric acid (Phenobarbital).—Phenobarbital is a sedative, and drowsiness frequently limits the amount that can be given. Individual susceptibility varies widely. Those who are allergic to the drug will develop a rash usually within two to three weeks. Overdosage results in the common barbiturate toxic symptoms, viz: ataxia, slurred speech, mental cloudiness and in the extreme case, coma. Phenobarbital is available in white tablets containing ¼, ½ and 1½ gr. It also may be dispensed as an elixir, ¼ gr. per teaspoonful, or given parenterally in the soluble sodium salt. It is extremely useful alone or in combination with other anticonvulsants in the treatment of grand mal, Jacksonian, and focal seizures. It is less effective in the treatment of psychomotor attacks and petit mal triad. Parenterally it is excellent for control of status epilepticus. It is excreted slowly, so that it need be given only once or twice per day, and usually given at bedtime to prevent drowsiness. Seldom is the total daily amount pursued beyond 3 to 4½ gr.

Diphenylhydantoin sodium (phenytoin sodium—Dilantin).—This is the drug of choice for the treatment of all major convulsions (grand mal), Jacksonian, and focal seizures, and the drug to be first tried in psychomotor seizures. It possesses effective anticonvulsant properties with little hypnotic effect. However, its administration requires careful supervision as the dose required to produce therapeutic effect may approach that at which toxic symptoms appear. Approximately 10-20 per cent of patients will have moderate reversible toxic reactions, of which are giddiness, inco-ordination, tremor, double vision, nystagmus, skin rash, gastric distress, and hypertrophy of the gums. Rarely an occasional patient may experience psychotic-like symptoms. These symptoms may be overcome by temporary reduction or withdrawal and then gradual readministration.

The drug is supplied in sealed capsules as follows: ½ gr., 1½ gr., 1½ gr. with ¼ gr. Phenobarbital, 1½ gr. Dilantin in oil, and 1½ gr. enteric coated capsules. For adults the usual dosage is one capsule (gr. 1½) three times a day, with each meal. If seizures continue an additional capsule at bedtime and if necessary increase to five to six capsules per day until seizures are controlled or unpleasant side-effects appear. If uncontrolled on four and five 1½ gr. capsules or they produce unpleasant reactions, compromise may be reached by taking four and five capsules on alternate days. Continuance of seizures on maximal tolerated dosage requires the addition of one of the other hydantoins or barbiturates.

For those individuals who complain of gastric distress while taking Dilantin, Dilantin in oil is recommended. An enteric coated capsule may be prescribed with plain Dilantin capsule at bedtime to provide for "around the clock" regime. For young children one-half the adult dosage is prescribed with gradual increase as needed.

With long continued use of Dilantin, most patients retain their initial improvement; however, an occasional patient after a long period of control may experience a recurrence of seizures. According to Williams,[6] when a patient taking hydantoins has a convulsion, he does so in an unprotected cerebrum which responds maximally, supporting the theory that the various anticonvulsants available operate in a dual fashion: (1) by reduction of the focus of irritability and (2) increasing the convulsive threshold of the remainder of the brain.

Methylethylphenyl barbituric acid (mephobarbital, Mebaral).—The sedative effect of Mebaral grain for grain is less than for Phenobarbital, hence larger amounts of the drug can be used without the production of mental clouding. It is frequently used in combination with the hydantoins and diones. It is supplied in ½ gr., 1½ gr. and 3 gr. white tablets. For adults starting dosage is 1½ to 3 gr. tablet three times a day.

Methylphenylethyl hydantoin (Mesantoin).—This drug is closely related to Dilantin and may be substituted for it or used in conjunction with it and the barbiturates. It is of minimal effect in the petit mal triad. Its superiority over Dilantin cannot be predicted. Even though Mesantoin can be given in much higher dosages than Dilantin, produces little or no ataxia, gum hypertrophy, gastric irritation, or hirsutism, it has the serious drawback that in the occasional patient it produces bone marrow depression with resultant blood dyscrasia and possible death. The less disturbing toxic or sensitivity symptoms include morbilliform rash with fever and itching, lymphadenopathy, and bleeding from the mucous membrane. Mesantoin is available in 1½ gr. pink tablets and in combination with ⅓ gr. Phenobarbital (Hydantal). Dosage is similar to Dilantin.

Sodium phenylthienyl hydantoin (Thiantoin sodium).—It is closely related chemically to Dilantin and has similar therapeutic and side effects. Although the drug has been available for over eight years reports in the literature are few. Peterman's reports[13] are favorable. There is no indication that Thiantoin precipitates or accentuates other types of seizures. It is available in 2 and 4 gr. capsules and in a lime colored suspension, 2 gr. per dram. The usual adult dose is 2 gr. three to four times a day.

Bromides.—The bromides, the original effective anticonvulsant, have been excelled by those previously mentioned, but should not be forgotten when the occasional patient fails to respond to the newer drugs. The side effects which limit the dosage are acne-like skin eruptions, mental apathy, and occasionally psychotic behavior. Although the bromides unlike the other antiepileptics can be measured in body fluids, the serum concentration does not parallel the clinical effectiveness. Bromides are available in 10 gr. tablet form, powder or solution. The adult dosage varies from 2.0 to 4.0 gm. per day.

Trimethyloazolidine dione (Tridione).—This is the drug of choice in the treatment of the petit mal triad and occasionally useful in psychomotor attacks when used with the hydantoins and barbiturates. Tridione unfortunately may precipitate or increase the number of grand mal attacks while controlling petit mal and should therefore seldom be used alone and should always be combined with the other anticonvulsants in an individual who suffers from both major and minor attacks. The minor side reactions, which may require temporary cessation, include gastric distress, morbilliform rash, somnolence, irrritability, hemeralopia, and hiccoughs. The potentially most serious complications are bone marrow depression, nephrosis, and exfoliative dermatitis. A number of fatalities have been recorded. Tridione is dispensed in capsules containing 5 gr. or as a peppermint flavored elixir 2½ gr. per dram. The adult dosage varies from 15 to 30 gr. per day, and for young children initial dosage is 7½ to 10 gr. per day.

Dimethylethyloxazolidine dione (Paradione).—It is an analogue of Tridione, similar in action, but although less apt to be toxic than Tridione, is less effective in the treatment of the petit mal triad. It is dispensed in two sizes, gr. 5 and gr. 2½. Dosage is similar to Tridione.

Phenacetylurea (Phenurone).—After four years' trial the drug is now available on the market. It is recommended in stubborn cases of epilepsy, chiefly psychomotor seizures, when the other anticonvulsants have failed. It should be used only with the full realization that it is potentially dangerous. One of the most frequent side reactions seen is a personality change, varying from mild depression to frank psychosis. Other reactions include nausea and vomiting, anorexia, headache, drowsiness, weakness, et cetera. The alarming toxic reactions include bone marrow depression and liver damage. Several deaths have been reported. Phenurone is supplied in 0.5 gm. bisected tablets. It is reported that side reactions are less apt to develop if the drug is gradually increased. Starting adult dosage is one tablet (0.5 gm.) three times a day with meals. If no untoward effects after one week, an additional tablet may be taken on arising and later on a tablet at bedtime. An average dosage of five to six tablets per day is the most adequate.

Accessory Drugs.—An essential amino acid, glutamic acid, available in 0.5 gm. tablets, has occasionally been used with some success in the treatment of minor attacks. Theoretically its effectiveness results from reduction of cerebral alkalinity. The enthusiasm for improving mental retardation and control of petit mal attacks has not been upheld by recent investigators. The amphetamines (Benzedrine, Dexedrine) are useful in counteracting the sedative action of large dosages of the anticonvulsants and are useful in controlling nocturnal seizures. Presumably this latter effect is produced by alteration of the sleep mechanism, and thereby resulting in a lessened depth of sleep.

Summary of Drug Therapy

For the control of motor seizures (generalized, Jacksonian, and focal), the hydantoins and barbiturates, alone or in combination, are the most efficacious. These drugs in various combinations should be tried first for control of the psychomotor seizures, and if unsuccessful, a switch to Phenurone, singly or in combination. For the petit mal triad the diones are most specific. When more than one type of seizure is present in a patient or a single durg is apt to percipitate another variety, combinations are mandatory. The drug least apt to produce side reactions is to be tried first. Frequently the "trial and error" method is necessary to determine the correct medication and dosage. Nevertheless the use of electroencephalography frequently indicates the specific medication or medications. The dosage must be individualized and must be given in adequate amount.

The bromides, Dilantin, Mebaral, and Phenobarbital are safe drugs. Fatal reactions are virtually unknown when used in therapeutic range. About 10 per cent of patients have moderate, reversible side reactions and less than 1 per cent have severe toxic reactions. About 35 per cent of patients will have moderately severe but reversible side reactions with Mesantoin, Phenurone, Tridione, and Paradione, and dangerous toxic reactions in 1-2 per cent. Phenurone is known to produce liver damage. Serious reactions to Tridione, Paradione, and Mesantoin are pancytopenia and exfoliative dermatitis, and also the diones cause nephrosis. About thirty deaths have been reported in the last six years.

A new drug that is potentially dangerous should be given only if the physician is certain that the patient will follow instructions, keep appointments for routine checkups, including urinalysis and hematologic studies. Hematologic changes occur in stages: (1) modified normal response, (2) then controlled neutropenia, and (3) finally pancytopenia. Peripheral blood work does not necessarily parallel the activity of the bone marrow, as the latter may be damaged without immediate detection in the circulating blood. A white blood count below 2,000 cells is an absolute indication for withdrawal of the offending anticonvulsant.

Dietary Therapy.—Brain metabolism may be altered by the ingestion of various foods. Repeated clinical studies have demonstrated the beneficial effect of ketosis. Over thirty years ago an osteopathic practitioner advertised to the effect that abstinence of food was of benefit in control of convulsions. Later in a number of clinical laboratories studies in blood chemistry and acid-base balance were conducted. Starvation gave way to production of ketosis by means of a diet rich in fat and poor in carbohydrates. This ketogenic diet was most effective in the treatment of children and more specifically the petit mal attacks of children. Because the diets are difficult to prepare, expensive, and unappetizing to the patient they are seldom prescribed and dietary treatment has given way to the newer anticonvulsants.

Surgical Therapy.—It is obvious that if the patient's seizures are secondary to a brain tumor or other type of expanding intracranial lesion (hematoma, granuloma, abscess) that craniotomy is indicated; and it is equally understandable that the brain operation does not necessarily free the patient from seizures. After operative intervention medical therapy is to be maintained for a minimum of two years.

Surgical removal of epileptogenic foci, including post-traumatic and post-infectious scars has become increasingly popular with the advent of electrocorticography. Temporal lobectomy in the treatment of intractable psychomotor epilepsy and hemispherectomy of a severely injured cerebral hemisphere, peppered with epileptogenic foci, have shown promise. These surgical procedures for removal of unstable brain foci are justified when medical therapy fails. After cortical resection of these foci anticonvulsants must be continued for several years for safe measure. Surgical therapy does not imply discontinuance of pharmacotherapy, it renders the latter more successful.

DRUG THERAPY IN PARKINSONISM

SIDNEY K. SHAPIRO, M.D.
Minneapolis, Minnesota

THE TREATMENT of a patient with parkinsonism is a combination of intelligent use of drugs, emotional readjustment and exercise. A great number of drugs have been used at one time or another. Most of these medications are now only of historical interest and are documented in a number of excellent reviews.[22,23,24,41] However, definite improvement in the clinical picture has been produced by some medications, and encouraged by this, investigators are still in search of the ideal drug for the treatment of parkinsonism. In view of the large numbers of new drugs introduced in recent years in therapy of this disease, a review of this phase of therapy seems timely. The medications currently in use or under investigation will be considered. The author's comments on the use of these medications are based on the experience of treating one hundred patients with parkinsonism over a three-year period at the parkinsonism clinic of the University Hospitals.

1. *Belladonna Derivatives.*—Excellent reviews on the belladonna drugs are available.[5,16,28,41] The belladonna drugs are widely distributed in nature, especially in the Solanaceae plants. Galenecal preparations of belladonna have been employed in medicine for many centuries and were known to the ancient Hindus. The professional poisoners of the middle ages often employed the deadly nightshade plant to produce a type of intoxication which was often prolonged and obscure. This prompted Linné to name this shrub Atropa belladonna, after Atropos, the oldest of the three fates who severs the thread of life. The word "belladonna" itself is a reminder of the antiquity of these medicines in that it signifies "beautiful lady," the women of long ago being wont to instill a decoction of belladonna in their eyes to produce dilated pupils, a sign of comeliness. In the treatment of parkinsonism, drugs of the belladonna group have been used since Ynauch in 1882 advocated the use of hyoscine. After that date, various alkaloids of belladonna, including atropine, hyoscyamine and scopolamine have been used extensively.

In 1926, Raeff,[41] a plant collector, used extracts of Bulgarian belladonna root to treat parkinsonism. This form of therapy was taken up and extended by Panegrossi,[41] who designated it the Bulgarian treatment. It was soon proved, however, that the Bulgarian belladonna root had no properties which made it superior as a therapeutic agent to the belladonna grown in other countries. Vollmer[39] considered that extracts of belladonna were too inconstant in the concentration of alkaloids and recommended the use of synthetic compounds, containing known concentrations of the various alkaloids. Extensive comparative studies[5,7] have shown that the alkaloids, root extracts and synthetic compounds have similar action and owe their activity to the alkaloids they contain. No one preparation is clearly superior to others. It is necessary to try the various drugs to find the one which is best for the individual patient. A change in medication may be necessary at a later date, and it is frequently necessary to shift from one drug to another for the maximum therapeutic benefit.[4,42]

The active alkaloids of the belladonna group used in the treatment of parkinsonism are atropine, scopolamine (hyoscine) and hyoscyamine. Atropine and hyoscine are used independently in the treatment of parkinsonism. Atropine[7] is administered in a 0.5 per cent solution commencing with 1 drop t.i.d and increasing to 10 drops t.i.d. Hyoscine is administered as hyoscine hydrobromide in tablets of gr. 1/100 and gr. 1/150. The amount of hyoscine hydrobromide given is that which produces the maximum benefit for the patient.

Tincture of stramonium contains atropine and hyoscyamine. The mode of administration of this drug recommended by Doshay[7] is to start with 20 drops t.i.d and slowly build up to 60 drops t.i.d.

The remainder of the drugs of the belladonna group, bellabulgara, rabellon and vinobel, are compounds, which contain varying proportions of atropine, scopolamine and hyoscyamine. Bellabulgara is a Lederle product. Each tablet of bellabulgara contains .4 mgm. of the total alkaloid of belladonna. Rabellon is a Sharp and Dohme

From the Division of Neurology, University of Minnesota Medical School, Minneapolis, Minnesota.

TABLE I. RABELLON SCHEDULE

Rabellon Tablets—.5 mg. each

Days	*A.M.*	*Noon*	*Bedtime*
1	¼	¼	½
2	½	½	½
3	½	½	¾
4	¾	¾	¾
5	¾	¾	1
6	1	¾	1
7	1	1	1
8	1	1	1¼
9	1¼	1	1¼
10	1¼	1¼	1¼
11	1¼	1¼	1½
12	1½	1¼	1½
13	1½	1½	1½
14	1½	1½	1¾
15	1¾	1½	1¾
16	1¾	1¾	1¾
17	1¾	1¾	2
18	1¾	2	2
19	2	2	2

Increase thereafter by ¼ tablet daily. If any toxic symptoms occur, such as *excessive* dryness of mouth, dizziness or blurring of vision, return to dosage of previous day for one week and then attempt to increase again. An attempt should be made to maintain maximum dosage without untoward symptoms.

product and comes in .5 mgm. tablets. Each tablet contains .45 mgm. of hyoscyamine, .037 mgm. of atropine and .012 mgm. of scopolamine. Numerous publications[11,14,15,25,38,39,40] confirm the beneficial effect of this medication. Vinobel is a Merrill product. The tablets are of two sizes, .4 mgm. (red in color) and .8 mgm. tablet (orange in color). Numerous publications[7,25] confirm its therapeutic effect.

The toxic symptoms encountered in the use of drugs of the belladonna series are dryness of the mouth; urinary retention; visual blurring; gastrointestinal symptoms such as nausea, diarrhea and constipation; central nervous system symptoms such as headache, dizziness, and in some instances confusion, delirium and hallucinations.

Comment.—Rabellon, vinobel, bellabulgara and to a lesser extent hyoscine and atropine are the drugs of this group which are being used in the clinic. Atropine is particularly useful where salivation is a difficult symptom to control and the addition of atropine sometimes produces a gratifying amelioration of this troublesome symptom. The mode of administration of the drugs of belladonna series is to determine initially the maximum dosage of the drugs that the patient can tolerate and then to determine the minimum dosage which produces the maximum therapeutic effect. This is the maintenance dose of the drug. Table I illustrates the scheme which is used in the administration of rabellon. A similar schedule is followed when the other drugs are prescribed. It should be noticed that the maximum dose of the drug is given before retiring so that if toxic symptoms are encountered, they will occur while the patient is asleep and thus cause a minimum of discomfort.

2. *Dihydro-beta-erythroidine.*—The clinical use of this drug was reported by Shapiro and Baker[33] in 1950. The drug is an alkaloid and the usual dosage is four of the 50 mgm. tablets per day. This drug is used as an adjunct to the atropine derivatives. It is indicated where rigidity is a feature. It has little effect on tremor or upon the oculogyric crises. The toxic symptoms are usually transient and consist of gastrointestinal manifestation, visual disturbance and some dizziness.

Comment.—Further experience with this drug substantiates the findings as reported in 1950.

3. *Parpanit.*—In 1946 Grunthal[17] reported on the use of "parpanit," an antispasmodic related to "trasentine," in a number of extra-pyramidal disorders and found it more efficient and less toxic than the atropine-like substances. Hartmann[18,19] confirmed these observations in 1946 and 1947, finding parpanit far more efficient in Parkinson's disease than the atropine-like drugs and reported briefly on its use in about forty patients. Schwab and Leigh[30] studied its effects in fifty patients over a period of three months, and basing their views largely on the patient's ability to carry out the ordinary "chores of life," they considered that parpanit was more efficacious than the solanaceous drugs in 62 per cent of the cases, that it had an equal effect in 22 per cent, and that in 16 per cent the effect was not so good. Their dosage ranged from 90 to 600 mg. per day, given in divided doses, preferably every three hours, but at most every two hours. The average dose was found to be from 200 to 400 mg. per day, which represents one 50 mgm. tablet five times a day. Toxic effects were frequent and occurred in two-thirds of the patients, and it was necessary in one-fifth of the group to stop treatment on this account. The toxic symptoms encountered in order of frequency were, "giddiness," nausea and epigastric "burning," feeling of lightness of the legs and a sensation of floating. Dunham and Edwards[9] confirmed the lessening of rigidity in patients on parpanit and considered that its ac-

tivity was comparable to that of the solanaceous alkaloids, but some patients found its side-effects, of which the most prominent is a sensation of dizziness, less upsetting.

Sciarra, Carter and Merritt[28] after using parpanit in twenty-eight patients with Parkinsonism reported that none of them showed objective improvement, and in only one patient was there subjective improvement. Toxic side-effects were encountered in 86 per cent of the patients on whom the drug was used.

Comment.—This drug has proved to be of limited value in our hands in the treatment of parkinsonism. It is not routinely employed. The high incidence of toxicity is a relative contra-indication to its widespread usage.

4. *Artane* (trihexphenidyl, or 3-(1-piperidyl)-1-phenyl-1-cyclohexyl-1-propanol hydrochloride).—In general, the reactions of artane resemble those of atropine. However, it is entirely free of the toxic effects of atropine on the cardiac vagus, blood pressure and circulation.[6] Doshay and Constable[6] after investigating its use in 117 patients with parkinsonism concluded that artane was "the drug of choice in the arteriosclerotic and idiopathic cases, and should be tried regularly in postencephalitic cases in which atropine or other forms of medication prove disturbing or ineffectual." The usual dose used was between 6 to 10 mgm. per day—with doses as high as 50 mgm. per day being used without deleterious effects. The toxic symptoms encountered included dryness of mouth, blurred vision, nausea or vomiting, dizziness or giddiness and drowsiness. Corbin[3] reported on its use and found that of sixty-nine cases with idiopathic paralysis agitans fifty-three were benefited, and of seventeen post-encephalitics twelve obtained some relief. The drug appeared to act by relaxing rigid muscles and in some cases tremor also was improved. The side-effects, usually slight, were, in order of frequency, dry mouth, nausea, "giddiness," blurring of vision, nervousness or "jitteriness," tinnitus, "tightness in the head" and soreness of the mouth. Four patients had severe and immediate toxic reactions; namely, mental confusion, dizziness with nausea, and marked agitation. The average daily dose used by Corbin was 8 mgm.

Schwab and Tillmann[31] treated forty-four patients with artane for three months and found it improved the condition of twenty-nine, but in most of them it had its greatest effect when given in conjunction with parpanit, benadryl, or an atropine preparation.

Comment.—This drug has proved to be a valuable addition to the therapy of parkinsonism. At the commencement of treatment three of the 2 mg. tablets are prescribed daily. This is increased by 1 tablet every other day until the patient is taking 6 mg. three times a day. The pills are best tolerated when taken after meals. We have not found it ordinarily beneficial to exceed this dosage. However, in the occasional case, additional benefit is obtained from increasing the dosage. This drug is particularly welcomed by the older age groups because of the low incidence of toxic side effects. In this regard, the most troublesome and potentially dangerous side-effect is that of a toxic encephalopathy. We have encountered six such cases to date, one of which terminated fatally. It is frequently necessary after a period of artane therapy to add one of the drugs of the belladonna series as the effect of artane appears to wear off when administered alone.

5. *Tolserol (myanesin):* (3-orthotoloxy-1,2-propanediol).—Favorable results following the use of this drug in the treatment of parkinsonism have been reported.[1,20,21,29,37] Toxic symptoms were rarely encountered and consist of (1) complaints of weakness, either in the arms or legs accompanied by a feeling of lassitude,[29] (2) nausea in one case,[21] (3) leukopenia in two of eight cases.[13] Early British investigators reported the presence of hematuria and hemoglobinuria but this has not been found by investigators in the United States. Tolserol is available in oral preparations, as suppositories, and in a 2 per cent solution for intravenous administration. Jeub[21] reports the effect of an oral dose as transitory, wearing off in forty minutes.

Comment.—This drug has proved to be of no use in the treatment of parkinsonism in the patients followed in our clinic.

6. *Antihistaminic Agents.*—Budnitz[2] reported a beneficial effect from benadryl in the treatment of eight cases of paralysis agitans of the arteriosclerotic group. Ryan et al,[27] reported similar beneficial effects from the use of benadryl in the treatment of forty cases of parkinsonism.

Comment.—Our experience with benadryl and the other antihistamines indicates that they are of limited use in the treatment of parkinsonism. However, in some cases, some additional benefit is derived by the addition of 50 mgs. of benadryl three or four times a day to the medication which the patient is receiving. The sedative effect of the drug is gratifying when the patient is tense. It should be emphasized that if benadryl is used, it should be used in conjunction with other medications.

7. *Diparcol* (diethylamino, 2, ethyl-N, dibenzo-para-thiazine hydrochloride).—The use of diparcol in the symptomatic treatment of Parkinson's disease was described by Sigwald, Bovet and Dumont[35] in November, 1946, at a meeting of the French Society of Neurology. In a later paper[36] the same group of investigators reported on 168 patients who had been studied carefully. They claimed satisfactory and frequently dramatic results in 53 per cent, good results in 24 per cent, and fair in 17 per cent. Only 6 per cent of their patients represented therapeutic failures. They felt that the clinical response was substantially more gratifying than had been obtained previously with earlier drugs. Some improvement in symptoms has also been reported by other observers[8,32] but the side-effects of this drug will probably prevent its widespread usage: they include severe vertigo, paresthesia in the legs, somnolence, transient paralysis lasting about an hour,[10] nausea, vomiting, hyperthermia, and leukopenia.

Comment.—Because of the high incidence of toxicity, this drug has been used only to a limited extent in the parkinsonism clinic. However, some patients who have failed to respond to all other medications derive excellent symptomatic relief from the diparcol. Its use should be restricted to the patients in whom all other medications have proved of no avail.

8. *Benzedrine.*—In 1935 Prinzmetal and Bloomberg[26] used benzedrine in treatment of narcolepsy. Since then it and more recently dexedrine have been used in the treatment of oculogyric crises, psychic abnormalities and lethargy.[41]

Comment.—Both benzedrine and dexedrine are useful in the management of oculogyric crises, mild depressions and somnolence and lethargy. The usual dosage is 5 mgs. of either of the drugs, two or three times a day. If the medicine is well tolerated, it may be increased to 10 mgm. two or three times a day. It is important not to prescribe benzedrine or dexedrine after 4 p.m. as administration after this time frequently prohibits the patients from sleeping. Benzedrine and dexedrine are usually given in combination with other drugs directed towards relief of the tremor and rigidity of parkinsonism.

9. *Lysivane* (Parsidol): (diethylamino-propyl)-n-dibenzo-parathiazine hydrochloride).—In September of 1949, Sigwald[34] reported upon the use of lysivane in the treatment of 106 patients with parkinson's syndrome. He stated that the drug gave a greater percentage of symptomatic improvement than any other treatment used in these patients. In six patients, he found it necessary to terminate the therapy because of severe toxic symptoms such as painful cramps, palpitations and very severe dizzy spells. Gallagher and Palmer[12] subsequently reported favorably upon the use of lysivane in forty patients and felt that on the whole it was superior to artane. They noted minor effects of drowsiness and transient giddiness from the drug but in no instance was it necessary to terminate treatment because of the toxicity.

Comment.—Our experience with this drug has been limited to ten cases. In two cases, there has been a result superior to that obtained with the other medications which the patients had received. A further period of observation will be necessary to determine the therapeutic effect and toxicity of this drug.

Summary

In commencing drug therapy in parkinsonism, one of the following drugs is recommended: Vinobel, rabellon, bellabulgara, hyoscine or artane. It may be necessary to try each of these drugs in turn before satisfactory control of the patient's symptoms is obtained. Additional symptomatic relief can on occasion be obtained by the addition of benzedrine, dexedrine, benadryl or atropine to the above medications. In the occasional patient who fails to respond to various combinations of the above medications, the use of parpanit is worth a trial. The experimental drugs, diparcol, dihydro-beta-erythroidine and lysivane, are not yet available for general usage.

Most people resist education and only the few seek it. Educators tell us there are three periods in life when the individual is very ready to learn: (1) the little child who is eager to learn everything; (2) the young mother who wants to learn how to care for her child; (3) the person who is ill and is very anxious to learn how to regain his health. The patient is a member of a community; he is anxious to learn how to get well and stay well, but he cannot learn without a teacher. The logical persons to reinforce the formal instruction which the patient receives, whether that instruction be given by the doctor or a nurse, are the members of the nursing staff in their daily contacts with the patient.—Aileen Flett, R.N., Canadian Tuberculosis Association, May, 1951.

SIMPLE PROCTOLOGIC PROCEDURES

WILLIAM C. BERNSTEIN, M.D.
Saint Paul, Minnesota

THE diagnosis and treatment of many disorders of the anorectal region fall within the scope of activity of the general practitioner and the general surgeon. This paper will have accomplished its purpose if some of its readers will have been stimulated to explore the possibilities suggested herein.

An accurate diagnosis is essential to the proper care of any disease condition. Especially is this true in the realm of anorectal diseases. Proctoscopic examinations have been available for many years. The procedure is a relatively simple one, and yet few people are given the benefit of this examination—even today. The time has come, however, when the proctosigmoidoscopic examination must be included as an integral part of every complete physical examination. Only in this way can we hope to improve the care which we give to our patients and to recognize and treat neoplastic diseases before the patient is confronted with a hopeless prognosis.

The present era should be referred to as the "proctoscopic era" because the importance of this examination is presently being recognized, and the procedure is rapidly assuming its rightful place in general physical surveys. Although the digital rectal examination is still a very important part of every physical examination, it cannot be considered an adequate means of investigating the lower bowel. Experience has taught that the proctosigmoidoscopic examination is the only accurate method at our disposal to evaluate the status of the rectum, rectosigmoid and lower sigmoid areas.

The time has come also when we should reevaluate the status of the barium enema x-ray in the diagnosis of lesions of the rectum and lower colon. Radiologists have warned time and again that the x-ray should not be depended upon to pick up or to rule out lesions in the rectal or rectosigmoid areas. Radiologists in increasing numbers are stressing the necessity for sigmoidoscopic examinations when there is a question of a lesion in that area. Yet, for some reason which is difficult to explain, physicians still send patients for x-ray studies of the colon as an initial procedure when symptoms point to trouble in the rectal or rectosigmoid areas and when a proctoscopic examination could easily and quickly supply the necessary information. The barium enema x-ray examination furnishes us with the only satisfactory means of visualizing the interior of the large bowel above the lower sigmoid colon and should be used routinely to supplement the information obtained from the proctosigmoidoscopic examination. It is extremely important to keep the fact in mind that 70 to 80 per cent of all large bowel disease is present in the lower sigmoid and rectal areas and that it is precisely in these areas that the x-ray is of questionable value. It would be well for all physicians to recognize that the indications for x-ray studies of the colon are *ipso facto* indications for proctosigmoidoscopic examinations.

Physicians interested in performing the proctoscopic examinations find little difficulty in learning the technique. The younger men are taught to perform the examination in the junior and senior years of medical school, and there is ample opportunity to practice the procedure during the internship. The physicians already in practice can, with a reasonable amount of effort, become proficient in the technique after a short period of time. The examination need not be a very painful experience for the patient. The physician should attempt to prepare the patient psychologically before the examination. If this is done, and if the examiner will carry on a running conversation during the examination to permit the patient to understand just what is occurring, the patient will relax and co-operate satisfactorily.

There are a few dangers that should be pointed out, and there are a few general rules that can be followed to avoid these dangers. In the performance of a proctosigmoidoscopic examination, one must be mindful of the fact that he is introducing a rigid metal tube into a hollow viscus and that perforation of the viscus may result. The peritoneal reflection on the anterior rectal wall sometimes reaches to very low levels and one cannot tell in a given case just where the reflection is located. Should perforation of the

---

Read at the annual meeting of the Minnesota State Medical Association, Minneapolis, Minnesota, May 27, 1952.

anterior rectal wall occur it is best to open the abdomen to make certain that the peritoneal cavity has not been entered. Perforations of the sigmoid colon always involve the peritoneal cavity and in the event of a sigmoid perforation the abdomen should be opened promptly and the perforation closed. If this is done within a few hours of the perforation, a proximal colostomy may not be necessary. If, however, a greater period of time has elapsed and there is evidence of peritonitis, a proximal colostomy should be performed at the time that the perforation is closed.

The following rules of safety should be observed when conducting proctosigmoidoscopic examinations:

1. A digital examination should precede every instrumental examination of the rectum. If the digital examination is done with a well-lubricated finger and gently performed without producing pain, the patient will be psychologically prepared for what is to follow. On the other hand if the digital examination is a painful experience for the patient, the subsequent instrumental examination will have to be performed under circumstances which are far from desirable. The patient will be tense and afraid, his muscles will be contracted, and the examination will be difficult to perform.

2. The obturator of the scope should be withdrawn as soon as the scope has passed beyond the grasp of the sphincters. From here on, the scope should be advanced only under direct vision.

3. Air insufflation should be used with caution. The use of air is a helpful adjunct in finding the lumen of the bowel but overdistention with air may cause disruption of the bowel wall or frank perforation. This is especially true in those patients in whom the bowel is already weakened by inflammatory processes or tumors. In patients suffering from ulcerative colitis or carcinoma the use of air insufflation is particularly hazardous.

Many of the procedures used to correct or alleviate anorectal disorders are quite simple insofar as techniques are concerned. When a complete examination of the entire rectum and lower colon has been performed, the following conditions will have been found in a large percentage of cases:

1. Rectal adenomas or polyps.
2. Hemorrhoids: internal, external and combined types.
3. External thrombotic hemorrhoids.
4. Anal fissure.
5. Perianal abscess.
6. Perianal fistula.

Rectal Adenomas or Polyps.—Polyps of the rectum and lower colon have been found in approximately 10 per cent of all healthy adults examined in the cancer detection centers throughout the country. Polyps are frequently found also in children and young adults who are examined on account of bleeding from the rectum. Since it is believed that all polyps in this area are premalignant, it is essential that they be diagnosed as early as possible and that proper treatment be instituted. Nonmalignant polyps in the rectum can usually be removed through the proctoscope as an office procedure. Since the rectal mucosa is devoid of sensory nerve endings, these polyps can be fulgurated without pain. Pedunculated polyps should be removed with some type of snare so that the polyps can be sent to the pathologist for microscopic section. Biopsy of the nonpedunculated polyps is also desirable to rule out the possibility of malignant changes. The destruction of polyps above the rectosigmoid area is best performed in the hospital since the danger of perforation is always present.

Hemorrhoids. — Most hemorrhoids are best treated by some type of surgical excision. There are several excellent techniques available which produce good results with short periods of disability and very little discomfort. Except for the excision of thrombotic external hemorrhoids and the injection treatment of internal hemorrhoids, patients should be sent to the hospital for this type of surgery. It is better for the physician to learn one method well than to try to adapt parts of various methods for a given case. A hemorrhoidectomy well performed and properly cared for during the healing period produces a very grateful patient. Poor results from hemorrhoid operations can usually be ascribed to lack of postoperative supervision of the wounds rather than to an inadequate surgical procedure. However, it must be borne in mind that a basic knowledge of the anatomy and physiology of the anorectal region is of paramount importance if one is to avoid the pitfalls of irreparable damage to the sphincter mechanism of the anal canal. The excision of hemorrhoids is usually a very simple procedure. The repair of a damaged sphincter, however, is usually a major surgical accomplishment.

The injection treatment of hemorrhoids remains a satisfactory and ethical method of treating a certain type of hemorrhoid. If the treatment is limited to the internal type of hemorrhoid which is not complicated by infection, stenosis or other type of lesion a good result can be anticipated. The poor results which are commonly seen are the result of the use of the injection treatment for hemorrhoids which do not fall into the above category. Quinine and urea hydrochloride (5 per cent and 5 per cent phenol in olive oil are the solutions most commonly used for the injection treatment. Sloughs and hemorrhage are the two complications most frequently seen, and these can be avoided by placing the solution in the proper place and by avoiding the injection of too large a volume of the solution.

Thrombotic External Hemorrhoids.—Thrombotic external hemorrhoids can usually be treated in the office. The clot of blood which produces the distention and pain only occasionally lies free beneath the skin and can be extruded through a linear incision. Most of the clots are firmly attached to the deeper tissues and are diffusely spread through the hemorrhoidal tissue in the distended mass. For this reason it is best to infiltrate the area around the hemorrhoid with a local anesthetic agent and to uncap the hemorrhoid rather than to incise it. The entire mass of hemorrhoidal tissue containing the clot can then be removed and a permanent result will be obtained. Sutures are required only if troublesome bleeding occurs.

Anal Fissure.—True anal fissures usually result from a combination of intrinsic pathological processes in the anal canal. The cure of the anal fissure is dependent upon the correction of the anal pathologic condition which produced the fissure. The application of ointments and the use of suppositories or silver nitrate solutions cannot be considered adequate treatment for anal fissure. Most fissures are secondary to infected anal crypts which have become traumatized by hard, constipated stools or explosive liquid movements. The surgical excision of the fissure should include the infected crypt and the resultant scarred area if present. Faulty bowel habits should also be corrected in order to assure a permanent cure. The surgical treatment of anal fissure is usually a simple procedure but must of necessity be radical enough to accomplish a proper end result. Inadequate treatment of this condition leads to unnecessarily long periods of disability. The injection of a long-lasting anesthetic solution beneath an anal fissure may give temporary relief from symptoms but does not usually lead to a cure of the fissure itself.

Perianal Abscess.—Abscesses appearing in or near the anal canal usually originate in the region of the pectinate line and travel subcutaneously to rupture or be drained externally. These abscesses should be drained or uncapped as soon as the diagnosis is made to avoid further destruction of the sphincter muscle fibres and the supporting tissues. A wound which is large enough to remain open without packing is preferable to simple incision since it serves to terminate the spread of the infection more adequately. Linear incisions tend to close over rapidly, and when this occurs, the infection continues to spread. A large percentage of these abscesses terminate as perianal fistulas. It is always a good policy to advise the patient of this fact so that he will anticipate a second operation for fistula. Patients do not take to the second operation kindly if they have been made to feel that the first operation did not accomplish the desired result. Except for the small abscess which is very fluctuant, the majority of these cases are best treated in the hospital where adequate anesthesia is available.

Perianal Fistula.—The fistulous tract resulting from a perianal abscess which was properly handled is usually a simple one. In other words, if the abscess was opened early in the course of the disease and before it had an opportunity to spread in different directions, the tract in all probability would be quite direct in its course. The cure of fistula-in-ano is always surgical. The tract must be laid open in its entirety although it is not essential to excise the floor of the fistulous tract itself. Wounds should be created that will remain open without packing, and these wounds should be kept as clean as possible during the

Rh INCOMPATIBILITY ACCOMPANIED BY ACUTE RENAL FAILURE

LLOYD D. MacLEAN, M.D., CLAUDE R. HITCHCOCK, M.D.,
AILEEN BLOMQUIST, B.S., and ARNOLD J. KREMEN, M.D.
Minneapolis, Minnesota

THE NECESSITY of more detailed Rh blood typing in prevention of acute renal failure was recently impressed on the staff of the University Hospitals by the appearance of a near fatal reaction in an Rh negative patient who received 1,000 cc. of Rh positive blood during an operation. These are preventable catastrophies which, in the light of present knowledge, should no longer occur in modern hospitals. It is the purpose of this report to document one such occurrence caused by failure to detect blocking antibodies in recipient serum, to describe means of preventing future accidents, and to outline briefly the management of this case.

Levine and Stetson,[4] on the basis of clinical experience in 1939, postulated the occasional presence of a hitherto unrecognized agglutinogen responsible for the sensitization of the mothers of erythroblastic infants. Subsequently, Landsteiner and Weiner,[3] in 1940, identified the Rh factor and Weiner and Peters,[11] observing this factor to be antigenic in Rh negative individuals, related it to the unnamed factor of Levine and Stetson.

Further researches[2,6,10] independently demonstrated that antibodies against the Rh factor usually agglutinate Rh positive red blood cells if the latter are suspended in specific protein media. These antibodies are referred to as albumen agglutinins, heat stable antibodies, or blocking antibodies. When antibodies cause agglutination of a saline suspension of erythrocytes they are designated saline or heat labile antibodies. To detect antibodies, the test red blood corpuscles can be suspended in serum, plasma, bovine albumen, or the Coombs[1] test may be applied. The following case report demonstrates the interference of blocking antibodies in a cross-matching procedure improperly designed to detect their presence.

Case Report

L. E. (U.H. 821510), a forty-seven-year-old white housewife was operated upon at the University Hospitals for a tumor at the angle of her right jaw which proved to be a malignant lymphoblastoma in the parotid gland. 1,000 cc. of blood was given during the procedure. On the third postoperative day icterus and anuria were noted, and the diagnosis of acute renal failure was established. Up to this time, the patient received 3,000 to 4,000 cc. of glucose 5 per cent in distilled water daily. From this point on fluid intake given as I.V. 50 per cent glucose solution was restricted to replacement of insensible fluid losses (Table I). In this fashion, a caloric intake of about 2,000 calories was provided daily despite persistent nausea and vomiting. The urine output rose to 50 cc. on the day following complete anuria and increased progressively to 1.5 liters on the fifteenth postoperative day.

Diuresis followed with formation of 6 liters of urine on the nineteenth postoperative day. Overhydration as assessed by mild pitting edema and increased body weight during the anuric phase was present from the second postoperative day and was not fully corrected until the twenty-first day after operation. Delay in establishing the diagnosis of lower nephron nephrosis, and parenteral fluid replacement with three to four liters of 5 per cent glucose in distilled water daily was responsible for the inadvertent overhydration in this patient. It is interesting to note the greatest depression of sodium and chloride occurred on or about the ninth postoperative day when the overhydration state was maximal as assessed by weight. This suggests that hemodilution plays a rôle in lowering the concentration of serum values of sodium and chloride. When diuresis was established these values rose toward normal, even though salt intake was restricted to less than the urinary losses of sodium chloride.

Discussion.—Retrospective investigation revealed the patient to be actually Rh negative and sensitized by two previous pregnancies. Her blood contained a high titer of antibodies that proved to be of the blocking variety. The patient was mistyped Rh positive and crossmatching methods used at that time did not provide a specific check for this kind of mistake. The procedure for typing and crossmatching at our hospital prior to the hemolytic reaction of this case was as follows:

1. Slide typing using anti-A, anti-B, and anti-D (anti-Rh) sera.
2. Cross-match in test tubes with incubation at 37°C for one hour. In one of two tubes was placed a mixture of donor's cells and recipients' serum in saline; in the other a

mixture of donor's serum and recipients' cells in saline.

3. If the blood was found to be Rh negative on typing, an additional test was done. A mixture of saline, anti-D serum and the donor's or recipient's blood were incubated for one hour at 37°C.

Recent changes of procedures in our blood bank include a test tube Rh determination on all bloods (step 3, above) since cold agglutination and rouleaux formation on slide typing are readily mistaken for true agglutinations. The saline suspension used for this test greatly reduces the probability of pseudo-agglutination and will correct the mistyped bloods from the slide test. In addition the standard cross-match (step 2 above) has been replaced by the serum cell method of cross-matching in which serum is used for the cell suspension in place of saline to identify blocking antibodies. Our patient's blood contained blocking antibodies which could have been detected accurately by this method. This test will also detect the small group of Rh positive individuals who have been sensitized by Hr antigen.

Experience with this and subsequent cases has made us increasingly aware of the importance of prevention of overhydration during anuria. Earlier authors attempted to resolve anuria by forcing fluids. Their report too often was: "in spite of injection of massive quantities of glucose and saline, the patient died of uremia and pulmonary edema." In the absence of fluid losses only 500 to 800 cc. of water needs to be replaced daily to maintain a 70 Kg. anuric patient in fluid balance.

The accumulation of metabolic products is not the important feature of this syndrome toward which therapy should be directed as Strauss,[8] Stork,[7] Thorn[9] and Muirhead[5] have emphasized. Available evidence indicates that death does not occur from retention of urea per se. Stork[7] found no correlation between death and height of blood-urea-nitrogen or non-protein nitrogen. Strauss[8] cites many cases of complete anuria from mistaken removal of a single kidney, carcinomatous obstruction of both ureters, and other causes in which the patients lived from five to seven weeks. It is of interest to note that these cases were reported in the older literature prior to the use of parenteral fluids. Death with lower nephron nephrosis since the era of parenteral fluid therapy, has usually occurred within eight days, and these patients invariably demonstrate pulmonary and generalized edema and increased body weight.

The development of hyperkalemia during anuria should be anticipated. If fluid and food are given orally, care must be taken to avoid the administration of potassium as contained in bouillon or fruit juice. Intravenous glucose and insulin may be helpful in treating hyperkalemia, but its effect is short lived. The artificial kidney appears to be an effective means of controlling hyperkalemia which appears during anuria. Increasing success with conservative management, however, both here and in other clinics, sharpens our awareness of the dangers inherent in the anuric patient. Strict control of hydration is probably the most important factor responsible for these successes.

Summary

The presence of blocking antibodies was recently responsible for failure to detect a mistake in Rh typing in our hospital. A hemolytic transfusion reaction resulted when the patient received

1,000 cc. of Rh incompatible blood during surgery. Complete anuria developed on the third postoperative day and a return to adequate urine output was delayed until the fourteenth day after operation. A moderate overhydration developed in our patient due to the two-day delay in detecting renal damage, and the necessity of giving fluids only in sufficient amount to replace insensible losses is stressed.

Modifications in the blood bank procedure include: (1) Performance of a test tube Rh determination on both Rh negative and Rh positive bloods, whereas formerly only Rh negative bloods were tested further in this manner. The mistyping of our patient could have been detected by this test. (2) Replacement of the saline suspension cross-match with the serum suspension method effectively detects blocking antibodies.

An incompatible blood transfusion has not been administered in this hospital in the two years since the above scheme has been utilized.

TREATMENT OF THE CONVULSIVE DISORDERS

(Continued from Page 1030)

Conclusion

The treatment of the "epileptic" patient requires an adequate medical examination, use of diagnostic procedures to determine the most likely etiology, and administration of the specific drugs in adequate dosage. These measures should be followed with rehabilitation of the individual in every respect in order that the convulsive patient may become a social and economic asset. Treatment of the convulsive disorder requires treatment of the total personality.

TREATMENT OF CONDUCTION DEAFNESS WITH ROENTGEN THERAPY

J. DONALD SJODING, M.D.
Mankato, Minnesota

THE PURPOSE of this paper is to discuss the treatment of conduction deafness with roentgen therapy and to review our experience at the Mankato Clinic with this form of therapy. We have used roentgen therapy in the treatment of chronic eczematoid external otitis and nasopharyngeal malignancy as a cause of impaired hearing, but in this paper we are concerned primarily with the use of x-ray in the treatment of nasopharyngeal lymphoid hyperplasia as a cause of conduction deafness. The literature concerning the use of radium in this condition is voluminous. However, little has been said and written about the use of roentgen therapy. Doctors Crowe and Burnam of Johns Hopkins University popularized the modern use of radium and its use has been only comparatively recent. A few national authorities in otology have stated that they are afraid of the use of radium, and that its use is only a passing fancy. Roentgen therapy has been used for many decades, and it is still used. Apparently its use is not a passing fancy.

The first report of x-ray therapy to the throat and auditory tube area for deafness that I can find is that by Jarvis[4] in 1923. He mentions the case of an adult patient who volunteered the information that the right ear which had been "stuffy" for ten years was clear, and that hearing was improved one week after x-ray treatment of the lingual tonsil. Jarvis found that prominent lymphoid nodules on the posterior pharyngeal wall and prominent lateral pharyngeal bands had decreased in size and redness forty-eight hours after exposure to roentgen rays. However, roentgen rays had been applied directly to the middle ear for treatment of tinnitus and chronic otitis media as early as 1904 by Joseph Beck of Chicago.[7] Jarvis further found that the type of patient subject to frequent head colds with more or less constant postnasal drip and frequent intervals of stuffiness in the ears with an accompanying impairment of hearing responded best to the use of roentgen rays. In the light of more modern knowledge, Jarvis' theory that the beneficial effect of x-rays in these cases was due to its effect on the bacterial content of the throat is not plausible. We have found x-ray useful in the same type of patient described by Jarvis. However, many of these patients are allergic and have evidence of functional autonomic imbalance. I submit that x-ray is helpful in these cases not only because it decreases the size of obstructive lymphoid tissue, but also reduces the function of the end organs of the autonomic nervous system. In other words, x-ray reduces the function of mucous and serous glands so that autonomic imbalance or allergy cannot stimulate these glands to hyperfunction. This is a similar action to that of chemical or electrical cautery of boggy wet inferior turbinates in vasomotor rhinitis. The number and effectiveness of secretory glands in the turbinates is reduced by cautery.

Degenerative changes in lymphocytes have been demonstrated a short time after exposure to x-ray radiation which produces degenerative and destructive tissue changes by ionization in the cells. Microscopic examination of adenoids which had been irradiated before removal shows that the action of the radiation is confined to the cells of the germinal centers. A few days after irradiation the cells show chromatolysis and fragmentation of the nuclei. Since the life span of the mature lymphocytes is very short—as low as twelve hours according to some authorities—the mass of the adenoid tissue gradually shrinks since there is no replacement from the damaged germinal centers by new lymphocytes. Schenck[10] has stated, and I quote, "More attention must be directed to the concomitant changes in the lymph channels and lymph vessels. Obstruction of lymph channels and lymph vessels occurs in the course of chronic infection by invasion of fibroblasts, constriction of fibrous tissue, and proliferation of endothelium within the lymph channels. Such obstruction to normal lymph flow must have significant effects upon contiguous lymph structures and the areas normally served by them. Irradiation produces striking effects upon the endothelium of the lymph vessels. Destruction of some endothelial cells

---

Read at the Annual Meeting of The Minnesota State Medical Association, Minneapolis, Minnesota, May 27, 1952.

occurs and the remaining cells appear contracted. The effect on occluded lymph vessels with multicellular walls is the conversion to channels with incomplete unicellular walls which permit the passage of lymph." Such action by x-ray radiation would eliminate obstructive passive lymph congestion in the auditory tube from lymphoid hyperplasia within the tube as well as in and about the auditory tube orifice. X-ray radiation has a cumulative effect. Its maximum effect is not fully apparent until about two weeks after the last treatment. For this reason we try to see the patient at the end of the x-ray treatments, and one, three, and twelve months after treatment. I have no pictures to show reduction in the size of lymphoid tissue after x-ray radiation, but by careful examination of the nasopharynx with the postnasal mirror and nasopharyngoscope using 2 per cent Pontocaine topically when necessary, we have seen gross changes occur after the radiation. Lymphoid tissue does decrease in size and auditory tube orifices blocked by a red, edematous mucosa and irregular hypertrophy of the torus tubarius have been seen to return to a normal appearance, wherein the torus is smooth and round, and the orifice itself presenting patency and a smooth pale mucosa in its floor and immediate edges. I have seen this normal appearance of auditory tube orifices in routine examination of the nasopharynges of patients who have no difficulties in their ears or throats.

The use of radium in the treatment of lymphoid hyperplasia of the nasopharynx as presented in extensive papers by Crowe, Burnam, Fowler, Boies, is not within the scope of this paper. An excellent symposium on Irradiation of Lymphoid Tissue of the Nasopharynx was given at the American Academy of Ophthalmology and Otolaryngology in October, 1949. It was shown that radium is of help in managing conduction deafness due to auditory obstruction from lymphoid hyperplasia. The dangers of handling radium was emphasized. Day pointed out in that symposium that the radium applicator was being used indiscriminately, and that this would result in more harm than good.

Roentgen therapy does have certain advantages over the use of radium in the management of deafness. Lampe[5] stated that the 50 mg. radium monel metal applicator inserted in the nasopharynx for twelve minutes delivers a dose of 4,428r at the surface. This dose is higher than the dose the experienced radiation therapist will use in the treatment of benign conditions. It is a cancerocidal dose used for lymphoid hyperplasia, which is a benign lesion. Lampe has stressed the possible danger of this dose not only to the patient but to the otologist who handles the radium. In roentgen therapy the dose delivered both at the skin and in the nasopharynx is below that of a cancerocidal dose. Our cases are treated by a certified roentgenologist who is well protected from the irradiation. Decker[1] urges that radium be used with great care and only by those qualified to use it. He believes that its scope of action is so small and so limited that if the lymphoid tissue extends beyond the small distance reached by the radium, success will not be achieved. For this reason he leans toward roentgen irradiation as being more inclusive and generally more effective than radium. Lymphoid tissue does extend along the auditory tube beyond the small distance reached by radium. Fowler[3] found microscopic evidence of lymphoid tissue in the peripheral portion of the auditory tubes and the middle ears of aviators killed during World War II. These microscopic slides were exhibited by the Army Institute of Pathology at the American Academy of Ophthalmology and Otolaryngology in 1949, and in many of these slides considerable collection of lymphoid masses were seen along the auditory tubes. Lindsay has stated before the Minnesota Academy of Ophthalmology and Otolaryngology that this tissue is not significant yet there is no reason why it cannot hypertrophy as well as the lymphoid tissue in and about the auditory tube orifice. In the work of Haines and Harris with submarine trainees during the last war it was found that 25 per cent of submariners who had open tubal orifices as seen by the nasopharyngoscope suffered grade-four damage to the middle ears in pressure tests. This would lend evidence to the fact that obstruction can be located in the peripheral portion of the auditory tube beyond the scope of action of radium. Roentgen therapy, however, will reach this obstruction. Farrior[2] has described various tests to determine the degree of auditory obstruction. These show peripheral auditory obstruction in many cases with no visible evidence of obstruction at the auditory tube orifice. Farrior states that roentgen radiation is indicated in these cases. Our own series of cases include three patients with conduction deafness from auditory obstruction and yet with no evidence of obstruction at the auditory tube orifice as seen by the postnasal mirror and the nasopharyngoscope. Their hearing was definitely improved by the use of roentgen therapy. Besides the very limited scope of action by radium, namely not over one cm., I am sure, we are all familiar with the great difficulty in placing the radium applicator immediately at the auditory tube orifice. In addition to lymphoid tissue existing in the periphery of the auditory tube, Robison has proposed that a nasopharyngeal lymph node in the region which the auditory tube traverses, can cause pressure on and displacement of the lumen of the auditory tube. Only roentgen therapy, of course, would reach such a lymph node. Other advantages of roentgen therapy over the use of radium are the relative ease of roentgen therapy and the freedom from fright that is connected with the insertion of the radium applicator.

Certain disadvantages or objections to the use of roentgen therapy have been raised in the past. One of these is that roentgen therapy will cause pituitary dysfunction. However, by examining a skull and considering the technique used, it can be easily seen that the pituitary gland is well above the path of the x-rays. Another objection is that x-ray must penetrate normal tissue to reach the nasopharynx and auditory tube. However, the normal tissue penetrated can withstand a much higher dose of x-ray than that used to shrink lymphoid tissue. A third objection is that x-ray will harm ossification centers. The only ossification center that receives any exposure to the x-ray is that in the condyle of the mandible. This center is united at the fourth month of fetal life.

Possible undesirable effects of roentgen therapy are dryness of the throat, swelling of the parotid gland, and nausea and vomiting. These effects have been seen occasionally but they have been transitory in duration. No permanent harmful effects have been seen from roentgen therapy.

Roentgen therapy in our cases is given by a certified roentgenologist. In the technique of treatment he places a rubberized lead shield with a 6 x 8 cm. portal over one side of the patient's head. The center of this portal is located at the angle of the mandible. The roentgen rays are directed inwards and slightly upwards through this portal to reach the entire auditory tube as well as the nasopharynx. Two hundred kilovolts are used. The target skin distance is 50 cm. and the rays are filtered by .5 millimeters of copper and 1 millimeter of aluminum. In adults a total dosage of 600r measured in air at the skin is given on each side of the head in four divided doses given over a two-week period. In children the total dose is 400r on each side. This gives a total dose of 318 to 366r at the nasopharynx in adults and 212 to 288r at the nasopharynx in children. Considering the cross-firing principle this dose is adequate to reduce lymphoid tissue in size. It is also a safe dose.

Results of the use of roentgen therapy in the management of conduction deafness have been good. In 1948 Youngs[11] reported 116 cases of conduction deafness treated with roentgen therapy. These patients varied in age from three to sixty-two years. Forty-six or 39.6 per cent of these regained normal hearing after roentgen therapy as determined by periodic audiograms, whispered voice, and tuning fork tests. Twenty-five or 21.5 per cent received marked improvement in hearing. Twenty-three or 19.8 per cent received some improvement and twenty-two or 18.9 per cent received no improvement of hearing. Richardson's[8] records based on 600 cases showed improvement from a slight degree to a complete recovery of normal hearing in not less than 60 per cent of a mixed group of cases. In 1937, O'Brien[6] reported seventy-three cases of chronic catarrhal deafness of a group of 140 with varying degrees of deafness as improved by roentgen therapy. In 1949, Rosenberger[9] reported twenty patients with impaired hearing treated with roentgen irradiation. One-third of these had significant benefit from such treatment after standard otologic treatment had proved ineffective.

Since March, 1949, 109 patients have received roentgen therapy to the nasopharynx at the Mankato Clinic. Several of these patients have been referred for treatment by doctors outside the Clinic, and their records are not available. Some of these patients have been given roentgen therapy for reasons other than auditory tube obstruction with conduction deafness. Fifty-four of these patients were given roentgen therapy because of conduction deafness secondary to auditory tube obstruction and with or without evidence of lymphoid hyperplasia. Thirty-two of these fifty-four patients returned for follow-up study. These thirty-two patients had had conduction deafness from about three months to about ten years and varied in age from five to fifty-three years. Most of them had lymphoid hyperplasia in and about the auditory tube orifice and all of them had signs of auditory tube obstruction. They had repeated audiograms, tuning fork tests, whispered voice tests, and nasopharyngeal examinations by the postnasal mirror and nasopharyngoscope before and up to one year after roentgen therapy. Study of their records shows that of these thirty-two patients eighteen or 56.25 per cent regained normal hearing after roentgen therapy, six or 18.75 received marked improvement in hearing, three or 9.37 per cent received slight improvement in hearing, and five or 15.62 per cent experienced no change in hearing after roentgen therapy. In all of these patients, examined repeatedly one month to one year after roentgen therapy, there was either complete recovery of the normal appearance of the auditory tube orifice as previously described, or marked reduction of the size of lymphoid tissue in and about the auditory tube orifice. Six patients not included in this series of thirty-two had a recurrent central adenoid mass associated with lymphoid hyperplasia in and about the auditory tube orifice, and conduction deafness. The central adenoid mass was removed surgically, myringotomy and spot suction performed, and roentgen therapy followed operation procedures with good results and recovery of normal hearing. These six patients are not included in the above series of thirty-two cases because it is not certain whether secondary adenoidectomy, myringotomy, and spot suction alone or operation plus roentgen therapy was responsible for the recovery of hearing. Many patients in addition to improved hearing after roentgen therapy received improvement in other symptoms. They reported fewer colds, earaches, sore throats, nasal obstruction, and a return of a clear feeling in their ears. Patients with a fluid level seen through their ear drums, and patients with dull lusterless retracted thickened ear drums regained a normal appearing ear drum after roentgen therapy.

A few case reports should be of interest:

Case 1.—A six-year-old boy (R.S.) was first seen November 29, 1950. He had had frequent attacks of otitis media and colds. His hearing was impaired even between colds. Examination revealed dull lusterless retracted ear drums, a well-performed tonsillectomy, and lymphoid hyperplasia in and about the auditory tube orifices. His audiogram returned to normal two months after roentgen therapy. His ear drums and auditory tube orifices had a normal appearance at this time also. To date, one year after treatment, his colds have been less in severity and frequency, and he has had no otitis media accompanying these colds. His hearing is normal, and his speech has been clear since roentgen therapy, according to the mother.

Case 2.—A nineteen-year-old woman (Mrs. G. W.) was first seen on August 30, 1949. She had complained of hearing difficulty for several years. Examination revealed auditory tube orifices blocked by lymphoid hyperplasia, tonsils and adenoids removed, dull retracted ear drums, negative Rinné, prolonged Schwabach, and impaired hearing by audiometric test. Only temporary improvement in hearing could be obtained by eustachian tube inflation. She was given 600r of roentgen therapy, and one month after this she happily reported that she could hear the whistle blow where she worked for the first time. Audiogram confirmed improvement in hearing. Her auditory tube orifices and ear drums returned to normal appearance, and audiogram at two months and two years after roentgen therapy showed sustained marked improvement in hearing.

Case 3.—A thirteen-year-old girl (M. M.) was first seen on August 5, 1949. She had had frequent sore throats, colds, fullness in the ears, and trouble hearing, especially in the left ear. Examination disclosed tonsils and adenoids removed, lymphoid hyperplasia in and around the auditory tube orifices especially on the left side, excessive lymphoid follicles on the posterior pharyngeal wall, and hearing impairment more marked in the left ear. One month after completion of roentgen therapy she stated that her ears felt clear. Audiogram showed improvement in hearing more so in the left ear and her auditory tube orifices appeared normal.

Case 4.—A fourteen-year-old boy (J. W.) was first seen on June 16, 1949. He had had chronic hearing impairment for two to three years, and a history of allergy. Examination disclosed allergic rhinitis, lymphoid hyperplasia in and about the auditory tube orifices, tonsils and adenoids removed, marked excess lymphoid follicles on the postpharyngeal wall, dull, retracted ear drums, and hearing impairment more marked in the left ear. Roentgen therapy was started and two weeks after the last treatment, his audiogram was normal, his ear drums and eustachian tube orifices appeared normal, and marked reduction in the size of lymphoid follicles on the postpharyngeal wall was seen. Recent conversation with the mother revealed that this boy's hearing recovery was sustained.

Case 5.—A five-year-old boy (S. P.) was first seen on November 16, 1948. This boy had had frequent attacks of otitis media with discharge, very frequent colds, and chronic hearing trouble for one to two years. His tonsils and adenoids had been removed at three years of age. Examination disclosed a red boggy nasal mucosa, red excessive lymphoid tissue in the lateral pharyngeal bands extending into and around the auditory tube orifices, dull lusterless ear drums, and hearing impairment by whispered voice and audiogram. Audiogram and whispered voice showed good improvement three weeks after the last x-ray treatment, and this continued to normal hearing. The mother reported one year later that the boy was getting along much better after x-ray. His breathing was better, and he had had fewer colds and much less ear trouble. Nasopharyngoscopy one year later showed normal auditory tube orifices.

Case 6.—This case is not one of lymphoid hyperplasia, but it proves that x-ray radiation can reach the auditory tubes and nasopharynx and alleviate obstruction therein. A sixty-one-year-old woman was first seen on December 15, 1950. This woman had had blocking and trouble hearing in the left ear for nine months, chronic sore throat for six months, and recent bleeding from the left side of the nose, and weight loss. She had a characteristic odor about her. Having detected the odor of much carcinoma during my residency training at the University, I immediately suspected carcinoma of the nasopharynx. Squamous cell carcinoma around the left auditory tube orifice was confirmed by inspection and biopsy. The left ear drum showed characteristic signs of secretory otitis media with retraction, prominence of the malleus, and diffuse amber color of the drum. Deep roentgen therapy in cancerocidal doses was given before a radium plaque was inserted in the nasopharynx, and the important point is that the left ear cleared completely, and hearing returned to normal after roentgen therapy, and before the radium was inserted.

Conclusions

1. A discussion of the use of roentgen therapy in the management of conduction deafness has been given and the experience with this therapy has been reviewed.

2. Roentgen therapy has a definite and useful place in the management of deafness secondary to auditory tube obstruction from lymphoid hyperplasia.

3. No permanent harmful effects from roentgen therapy have occurred when given by an experienced radiation therapist.

4. The otolaryngologist and roentgenologist must work together in this form of therapy.

SIMPLE PROCTOLOGIC PROCEDURES

(Continued from Page 1038)

postoperative period. Unless the primary fistulous opening is eliminated, the fistula will recur. The sphincter fibres which overlie the fistulous tract must be incised. However, if the wounds are treated properly during the healing phase, one can expect very little disability from the severed sphincter fibres.

Summary

1. The time has come when proctoscopic examinations must be performed by all physicians interested in arriving at accurate diagnoses of lesions in the rectum and lower sigmoid colon.

2. The early diagnosis and eradication of polyps in the rectum and lower sigmoid colon will solve a large part of our cancer problem.

3. A large number of troublesome lesions of the anorectal region can be treated by simple surgical procedures. Accuracy in diagnosis, plus a basic and accurate knowledge of the anatomy and physiology of the involved structures, is essential for the proper treatment of these lesions.

ANTICOAGULANTS IN CARDIOVASCULAR DISEASE

JOSEPH F. BORG, M.D.
Saint Paul, Minnesota

"Thromboembolism is not a disease or a syndrome. It is a fundamental pathologic process common to a variety of disorders. It is the considered opinion of competent observers that we are today only crossing the threshold into a vast field of clinical pathology which evolves from the formation of intravascular clots."[5]

THIS STATEMENT from the most important contributor to a rapidly advancing field of clinical knowledge emphasizes the usefulness of anticoagulants over a broad spectrum. The outlook for patients suffering from such conditions as pulmonary embolism, venous thrombosis, arterial occlusion due to thrombosis or embolism, and congestive heart failure has been materially altered by the availability of these substances.

The first suggestion that intravascular clotting and the serious results thereof could be controlled came with the discovery of heparin and its introduction in 1938 in the treatment of thrombosis. With the purification of this substance to eliminate the early toxic effects due to impurities, numerous investigators established its usefulness in therapy. Meanwhile, the discovery of the first of the cumarin products at the University of Wisconsin introduced an anticoagulant which had many advantages. This progress, together with the more widespread recognition of thromboembolic phenomena, set the stage for the remarkable work with these substances which followed.

Of major importance in this therapy is the use of the anticoagulants in conditions affecting the heart. These include peripheral thromboembolic conditions, coronary occlusion with myocardial infarction, rheumatic heart disease with auricular fibrillation and embolism and congestive heart failure, conditions in which this type of treatment has been widely accepted. Peripheral vascular conditions associated with thromboembolism frequently complicate heart disease and contribute to the clinical picture as the result of lodgement of emboli originating in the heart or as the frequently unrecognized origin of emboli, especially to the lungs, occurring during the course of heart disease. Sudden peripheral arterial occlusion due to thrombosis or embolism, thrombophlebitis, and phlebothrombosis carry serious prognostic implications and should be treated with the anticoagulants both in the acute attack and prophylactically. These vascular complications occur frequently in other than cardiac conditions in which patients of older age groups must be confined to bed or similar inactivity for prolonged periods. Anticoagulant management of these conditions with its resultant marked decrease in mortality makes it necessary to search for them more diligently than has been done in the past.

In 1942 significant reports began to appear in the literature dealing with the problem of thromboembolism and the use of dicumarol in coronary thrombosis. Statistical studies concerning the significance of the problem soon followed. Wartman and Hellerstein,[9] reporting 160 cases of myocardial infarction studied at autopsy, found 38 per cent to have multiple fresh, or fresh and old infarcts. Mural thrombi were found in 34 per cent of those patients who had a single infarct and 48.5 per cent of those who had multiple attacks. These showed mortality figures for the acute attack varying considerably, from 50 per cent in early reports, to 8 per cent in some later ones. Averaging the figures on control patients in ten communications on dicumarol therapy published since 1946, the mortality is shown to be 31.1 per cent of a total of 1,180 cases. In addition to this it also became evident, after the importance of thromboembolic complications in infarction became known, that these were an important factor in prognosis. Clinically recognized secondary myocardial thrombosis during the immediate convalescence from a previous infarction occurred with varying but significant frequency. These always carried a higher mortality than the earlier ones.

Peripheral thromboembolic lesions complicating coronary thrombosis may be easily overlooked as is seen by the increasing frequency with which they are being reported, especially at autopsy. Clinically, a series assembled from the literature[2] revealed that 11.5 per cent of coronary thrombosis patients had them, while reports from autop-

---

Read at the annual meeting of the Minnesota State Medical Association, Minneapolis, Minnesota, May 27, 1952.

sy investigation showed an incidence of 25 to 70 per cent of such lesions. Hellerstein and Martin[3] showed that peripheral thromboembolic lesions occurred in 55 per cent of cases in which mural thrombi were demonstrated as compared with 39 per cent of those in which they were not. The difficulty of recognizing all of the thromboembolic lesions clinically is shown in the report of 200 cases by Eppinger and Kennedy[2] in which 8.3 per cent of patients with acute coronary thrombosis dying during the subacute period showed them at autopsy, but in only 4.8 per cent were they recognized clinically. Obviously the degree of clinical suspicion as well as the thoroughness of postmortem examination affect these figures materially. Peripheral thromboembolic lesions occur in the following order of frequency: lung 23.5 per cent, kidneys 14.4 per cent, spleen 8.8 per cent, extremities, 5.5 per cent.

The results of these and other studies encouraged the use of anticoagulant therapy and led to favorable reports but the numbers of cases were insufficient to warrant final conclusions. Cognizant of this, the American Heart Association established a co-operative project to study the problem and a committee consisting of investigators from sixteen leading hospitals was appointed for this purpose. In 1948, Wright, Marple and Beck[10] reported for this committee on the results obtained in the treatment with dicumarol of 1,031 patients who had coronary occlusion with myocardial infarction. This report showed a mortality of 15 per cent in dicumarol treated patients compared with 25 per cent in the control series. It also demonstrated that the greatest improvement was in those cases which showed thromboembolic complications prior to death, that the reduction in death rate was chiefly effected by control of thromboembolism. Death rates by weeks of illness were highest in the first two weeks, but still considerable in the third and fourth weeks. Greatest benefits were shown in patients over sixty years, not only in saving lives, but also in preventing serious permanent disabilities such as hemiplegia, chronic venous insufficiency, or residual myocardial damage (following myocardial infarction). Thromboembolic complications occurred in 25 per cent of control cases and 6 per cent of cases effectively treated with anticoagulants. These complications were new infarcts, extension of infarcts, pulmonary, cerebral or peripheral emboli and venous thrombosis. The results of this study have been widely accepted as justifying the conclusion that anticoagulant therapy should be given to all patients with coronary thrombosis and myocardial infarction unless specific contraindications exist.

In addition to coronary thrombosis there are two other primary heart conditions in which anticoagulant therapy is indicated. Patients having rheumatic heart disease with auricular fibrillation occasionally develop multiple peripheral emboli from mural thrombi. These patients, subject at any time to permanently crippling embolic disease, should have anticoagulant therapy with the cumarin compounds. Wright and Foley[11,12] have described a series of patients so treated and have reported their results in these cases as truly dramatic. The other condition is that of congestive heart failure in which thrombi frequently occur due to slowing of the blood stream. The results obtained by Anderson and Hull[1] and other workers indicate a definite decrease in the incidence of thromboembolic phenomena as well as a resulting decrease in mortality. This is a condition in which the anticoagulants must be used with more than ordinary caution because of the increased sensitivity to them in the presence of impaired liver function, so commonly found in congestive failure.

Contraindications to the use of anticoagulants may be listed as follows:

1. *Hypoprothrombinemia,* usually associated with liver or pancreatic disease, or intestinal diarrheal disease. These conditions are marked by a deficient synthesis of prothrombin due to an inability to use Vitamin K.
2. *Vitamin C deficiency,* animal experiments on which indicate that the effect of a given dose of dicumarol is enhanced and prolonged. Wright[5] maintains that all patients should be given Vitamin C with anticoagulant therapy.
3. *Renal insufficiency,* in which exaggerated dicumarol effects result. The reason for this effect is not clear.
4. *Blood dyscrasias,* purpura, leukemia, aplastic anemia, in which bleeding tends to occur. In polycythemia it may be used with caution.
5. *Immediate postsurgical problems,* ulcers, especially of the gastrointestinal tract, and late pregnancy, in which massive hemorrhages may occur.
6. *Subacute bacterial endocarditis,* in which the risk of hemorrhage seen in this disease may be increased.

Administration of anticoagulants in acute problems should be started with heparin the action of which is almost immediate. It must be given parenterally, by continuous drip or intermittent administration intravenously, or by intermittent injection of an aqueous solution or a suspension in a slowly absorbed preparation as Pitkin's menstruum or as depo-heparin intramuscularly or subcutaneously. The simplest method, and most comfortable for the patient, is the intermittent intravenous injection of 50-75 mgm. of heparin every four hours. Heparin in Pitkin's menstruum may be given in average doses of 300 mgm. daily. Depo-heparin is given in doses of 200 mgm. twice daily, watching the coagulation time before each injection. If the latter exceeds twenty minutes the next dose is omitted or postponed. Objections to Pitkin's menstruums are the local pain which it usually produces and the variable effect it has on the coagulation time.

With the start of heparin, the prothrombin time is determined, and if normal, 200-300 mgm. dicumarol is given orally, followed by 100 mgm. daily until the prothrombin time reaches twice the control. The heparin is then stopped and the dicumarol continued in doses designed to keep the prothrombin activity at that level. Dicumarol acts by interfering with the synthesis of prothrombin in the liver and has the definite advantages of being cheap and orally effective. It must be remembered in judging dosage that it takes from forty-eight to seventy-two hours for it to become fully effective, and that the action persists for two to seven days after discontinuing the preparation. Also the response in individuals varies, as does the response in the same individual. Within a week the needs of the average patient can be ascertained but because of these varying factors the prothrombin time must be determined daily for a considerable period. Later, if the administration is prolonged it is usually possible to extend the intervals between prothrombin estimations. While several techniques have been recommended for determining prothrombin times, the Link-Shapiro modification of the Quick method is most widely used, expressed in seconds as compared with the control time or the percentage of prothrombin activity.

The average necessary maintenance dose is 50 mgm. daily. Occasional hyporeactors may require up to 200 mgm. daily, while hyper-reactors, sometimes seen in cases with renal or hepatic damage or chronic myocardial insufficiency, require less. Some observers have recommended larger doses two to three times weekly, but the use of smaller daily doses is more widely accepted. Where the prothrombin time fluctuates erratically, divided doses of dicumarol or the use of one quart of milk daily has been recommended to increase stability. Therapy is continued for 20 to thirty days after the thromboembolic episode with the object of keeping the prothrombin time at two to two and a half times the control as recommended by Nichol.[6] The method of administration here outlined is applicable as well to any condition in which prompt anticoagulant effect is desired.

The anticoagulants have been non-toxic except for the hemorrhagic complications which with increasing experience have presented no risk that is unjustified. These manifestations such as epistaxis, minor hemoptysis, bruising and the appearance of erythrocytes in the urine have been infrequent and usually unimportant. The latter, if watched for, may foretell the occurrence of the only really important major complication, hematuria. Several occurrences of this have been seen, but in instances where lapses in observation occurred and where symptoms pointing to probable renal involvement should have been a warning to stop therapy. These consisted of low back and groin pain of aching type, occurring several days before gross hematuria and renal colic appeared. While this caused considerable discomfort for several days, complete healing with no sign of residual renal damage occurred. Serious hemorrhage, then, is usually a sign of poor management, or the overlooking of ulcerative lesions, usually gastrointestinal, from which bleeding occurred.

With the onset of hemorrhage, the anticoagulant must be stopped. If not serious, the condition will soon correct itself. If marked, transfusion should be instituted, replenishing the patient's prothrombin. The latter is used up rather quickly and the transfusion should be repeated at four- to six-hour intervals until the prothrombin time is decreased. At the same time Vitamin K is injected intravenously in the form of Menadione, Synkavite, Hykinone or similar preparation, in doses of 60-72 mgm. every four hours until the prothrombin time returns to normal. Even with these measures considerable time, several days, may elapse before the condition is corrected. The Vitamin K preparations do not lessen the hypoprothrombinemia but counteract it and control the bleeding. Recent studies[4] indicate that

Vitamin K_1 oxide acts much more rapidly in restoring prothrombin times to safe levels.

Aware of the importance of recurring coronary thrombosis after an attack, Nichol and Borg[7] set out to determine the feasibilty of long-term ambulatory dicumarol therapy following an acute attack and presented a preliminary report on their results in 1950. All patients intelligent enough to understand and co-operate with the program were continued on dicumarol therapy with the object of keeping the prothrombin time at a level approximately twice the control, after the aims of the program had been explained to them. They were told to be on the alert for any untoward symptoms or evidences of bleeding, on the occurrence of which they were to discontinue the drug. They were also instructed to stop the drug during the occurrence of any gastrointestinal disorder on the theory that undetected liver disturbance might be present. Prothrombin times were checked at intervals up to two weeks. These results indicated that the method is a feasible one. Criticism that it would tend to make patients too heart-conscious and provoke and increase cardiac neurosis has seemed unjustified. In fact it seems to have been a reassuring program to most of them and there have been no serious problems of that type. The patients seem willing and anxious to partake in a program designed to give them protection against future trouble. Since the 1950 report, the number of patients in this study has been considerably augmented and continuance of the program has been encouraged.

A report on subsequent experience was presented before the recent meeting of the American Heart Association. In this, the following data on 224 patients which are included in the joint program and have been on anticoagulant treatment for two to fifty-nine months were presented. A hundred and twenty-six patients have continued therapy since its inception, and sixty-four patients have discontinued treatment voluntarily. Peripheral thromboembolic phenomena have not been observed in this group.

Hemorrhagic complications have occurred in ninety-four of the entire group. Fifty-three of these were minor such as epistaxis, purpura, hemoptysis, bleeding gums. Forty-one were classed as major hemorrhages, notably gross hematuria in twenty-two patients, gastrointestinal hemorrhage in four patients and hematoma in five patients. All of these recovered without sequelae. With increased experience in management and improved alerting of patients for the early appearances of complications, the latter are now relatively unimportant. No major hemorrhages have been observed in this writer's experience during the past three years.

Thirty-four patients have died while under treatment. Autopsies were performed on fifteen of these, in which four showed fresh infarction, five showed subendocardial fibrosis, and six showed old healed infarcts. Among those not examined postmortem were ten patients who died suddenly, two who died within 48 hours after an attack of protracted coronary insufficiency (not proved infarction), five who died from congestive heart failure, and two from probable cerebrovascular accidents.

It will take a considerably extended and prolonged study of this type to justify drawing significant conclusions. Until better studies of the expected course in a series of first infarctions are available, the value of this procedure must be regarded conservatively. The high percentage of survivors, however, together with the low percentage of recurrence of coronary thrombosis in this series as compared with the prognosis in patients not treated with long-term anticoagulants, suggests the desirability of this type of management of patients with myocardial infarction.

When it is recognized that there is much about intravascular clotting and anticoagulants that is not understood, it is not surprising that failures and even deaths with this treatment occasionally result. Analysis of these shows that usually the blame must be put on management, due to: (1) delay in the institution of therapy; (2) inadequate prothrombin blood levels; or (3) premature discontinuance of medication. If these factors can be controlled, failures will be few, yet there will be found isolated rare instances in which thromboembolic phenomena may occur in patients supposedly well handled.

Since the discovery of dicumarol with the recognition that it is not the perfect anticoagulant, search has been, is being, and will continue to be made for a more satisfactory product. To date two preparations have been made available to the profession, both satisfactory anticoagulants. Tromexan has the advantage of reaching its peak activity more quickly, in twelve to eighteen hours, with the action of a dose subsiding in about forty-eight to sixty hours. Maintenance dose varies from 600-900 mgm. daily. Cyclocumarol recently has become available with more rapid onset of effect than dicumarol and more prolonged action. These have been regarded as advantages by some. The average initial dose is 100-200 mgm., with maintenance doses averaging 25 mgm. It is difficult to recognize important advantages over dicumarol in the later products. Serious hemorrhagic complications should not occur in well managed patients. Where they do, the same procedures for treatment apply for all preparations. On the other hand, the cheapness of dicumarol has much to recommend it, especially if the substance is used over a long period of time, and if the physician is well versed in its action it will be found to be a satisfactory product.

Conclusion

1. The anticoagulants have opened an important new field of treatment in heart disease.

2. Mortality and morbidity in coronary thrombosis, congestive heart failure and rheumatic heart disease complicated by multiple emboli have been markedly improved.

3. Long-term anticoagulant therapy has been proved feasible and gives promise of considerable value in decreasing morbidity and mortality in patients who have recovered from myocardial infarction.

4. Anticoagulants are not essentially toxic in themselves but poorly managed use of them can lead to hemorrhagic complications.

5. The use of anticoagulants requires the utmost of vigilance and intelligent knowledge as to their action and no physician who is unwilling to accept this should assume the responsibility of their use.

NEW DRUGS IN THE TREATMENT OF HYPERTENSION

(Continued from Page 1024)

Because undesirable reactions can occur, it would seem advisable to institute this program of treatment only for the more severe forms of hypertensive vascular disease and only if the program can be started in a hospital under careful supervision of a physician and continued under the close supervision of the physician.

FUNCTIONAL UTERINE BLEEDING

RODNEY F. STURLEY, M.D.
Saint Paul, Minnesota

ABNORMAL UTERINE bleeding has been discussed many ways. I should like to restrict the subject to problems arising in the sexually active woman and related to abnormalities in the physiology of the menstrual cycle.

The physiology of the normal cycle must be considered before approaching the abnormal. In brief, the cycle must be considered as two phases ending either in pregnancy or menstruation. The first, or proliferative phase, is the result of the estrogenic hormones secreted by the developing follicle. During this portion of the cycle, the cells of the glands and stroma increase in number. This results in a thickened endometrium containing fairly straight glands showing little secretory activity. The luminal borders are smooth, the nuclei are usually more or less centrally located and the amount of cytoplasm is minimal. Following ovulation, the endometrium is affected in a striking fashion by progesterone, the hormone produced by the corpus luteum. Estrogenic hormones are maintained at approximately the same level throughout the entire cycle. The active growth or proliferation seen in the first phase now ceases and is replaced by physiological changes in the stroma and glands in preparation for nidation. The second, or secretory phase, is recognized histologically by the huge increase of cell size in both stroma and gland. The glandular cells are swollen and begin active secretion. The increase in cell size causes the gland to bend and turn in a tortuous fashion, straightening out only near the surface of the endometrium where the stromal cells are prominent. Should pregnancy result, secretory activity is accentuated. Lacking this, the endometrium is cast off over a period of three or four days. The entire cycle is then repeated. The regular shedding of endometrium is the result of estrogen and progesterone withdrawal.

The rhythmic pattern of the menstrual cycle can be interrupted during either phase, resulting in abnormal uterine bleeding. Bleeding of this nature, in other words functional bleeding, can be accurately diagnosed histologically and explained hormonologically.

Hyperplasia of the endometrium, the more frequently occuring lesion, is related to the first, or proliferative phase and is the result of continued estrogenic hormone effect uninterrupted by the effect of progesterone. The basic cause is the failure of ovulation due to an unexplained breakdown in the normal pituitary-ovarian relationship. It is not known why the pituitary gland suddenly fails to bring about ovulation and luteinization. Curiously enough, one cannot successfully produce ovulation and luteinization by the administration of anterior pituitary substances in human beings. This explains the unsuccessful results in the use of gonadotrophic hormones in the treatment of hyperplasia.

The greatest incidence of hyperplasia is in the young girl and the woman approaching the menopause. The degree of disability varies widely. Some patients describe long intervals of inactivity followed by uterine bleeding which may be prolonged, heavy, or both. On the other hand, the bleeding phase may be almost constant with only a few days during which the patient will be free of blood loss. The usual symptoms are those resulting from acute or chronic blood loss. The findings on physical examination are not unusual, although some authors have noted a rather high incidence of enlarged, cystic ovaries.

While the history is often very suggestive, it is unwise to begin definitive therapy until the diagnosis has been established histologically. Not infrequently, curettage will reveal some other pathological finding uninfluenced by medical therapy. These lesions vary from malignancy involving the endometrium or the cervical canal to the lesser important incomplete abortion or polyp. Once the diagnosis is established by curettage, one is justified in following the course of the disease by the use of the endometrial biopsy. In the older patient, do not forget the danger of carcinoma developing even though a diagnosis of hyperplasia has been made previously by curettage. Thus, if too great a lapse of time exists between the original curettage and the recurrence of irregular bleeding, do not hesitate to recurette.

Read at the annual meeting of the Minnesota State Medical Association, Minneapolis, Minnesota, May 27, 1952.

The management of hyperplasia can be roughly divided into two categories. First, efforts are directed toward the control of bleeding. Second, attempts are made to re-establish normal, regularly occurring, menstrual periods. Profuse bleeding is best controlled by curettage. This should be the method where no previous histological diagnosis has been made, or when the bleeding is of proportions sufficient to produce marked anemia or shock. Patients previously curetted who are not bleeding to an alarming degree may be treated hormonologically. Just about every individual interested in hyperplasia has a method which he believes superior. Since the methods vary widely, it is apparent that the perfect method is not available. Bleeding can be controlled with testosterone, stilbestrol, the true estrogens, and with progesterone. Some methods employ combinations of two or more hormones with apparent success. It is not my purpose to outline the various procedures, but instead to present one approach to the problem which is based upon the physiology of the menstrual cycle. It is admitted that no single method will be successful in all cases, therefore anyone handling hyperplasia is justified in trying different methods when the initial effort is without success.

Since the bleeding phase in hyperplasia is the result of estrogen withdrawal, the re-establishment of available estrogenic substances should have a healing effect. This is true. Large doses of estrogens will cause cessation of bleeding. This can be done by the oral, intramuscular, or intravenous administration of estrogens. The latter may well produce a quicker response, but my own personal experience is limited. The following routine has proven adequate in most cases. The patient is given 40,000 International Units of crystalline estrogenic substance intramuscularly. This is followed by the oral administration of five milligrams of conjugated estrogens daily for five days. This usually stops the bleeding. On the third day of therapy, 100 mg. of progesterone is given intramuscularly. Five to seven days after the administration of progesterone, the patient will bleed again for about the same length of time associated with a normal menstrual period. We have produced a secretory endometrium which is shed after the withdrawal of the hormone therapy. Hormone therapy following this physiological curettage is directed toward the re-establishment of rhythmic bleeding. Abnormal findings, such as secondary anemia, a low metabolic rate, and obesity must also be corrected.

The third day of the artificially created menstrual bleeding marks the starting point of treatment each month. Thereafter the patient is given 2.5 milligrams of conjugated estrogens orally each day for three weeks. On the twenty-first day of the artificially created cycle the patient is given 100 mg. of progesterone intramuscularly or is given 50 mg. of progesterone intramuscularly every other day for a total of three doses. Both methods are satisfactory. A larger single dose has the advantage of requiring only one visit to the office by the patient during the treatment period. It is, however, considerably more painful than the smaller dose. If the treatment is successful, the patient should bleed approximately one week after the administration of the progesterone. This cyclical therapy should be repeated over a period of three months. Treatment is then discontinued to observe possible resumption of menstrual periods in the normal fashion. The treatment is not intended to be a direct stimulation upon the faulty pituitary gland and ovary. Actually it is directed toward the end organ, the endometrium. However, it is suggested that re-establishment of rhythmic bleeding has a beneficial effect upon the ovary and pituitary gland which results in the re-establishment of ovulation. The success of the treatment cannot be accurately explained. It does avoid the use of substances, such as testosterone and stilbestrol, which may have undesirable side effects.

The described method of treatment may be repeated, particularly in the young girl or woman desirous of further pregnancies. Unsuccessful hormonal management of the young woman who has obtained her desired family may sometimes justify hysterectomy. The older woman near the menopause who has repeated episodes of severe bleeding should have the already failing ovarian function eliminated by the simple application of a sterilizing dose of x-ray to the pelvis.

The young girl must be handled conservatively. She must be given every opportunity to re-establish normal ovarian function. The use of surgery in these children must be restricted to curettage, even if it be used repeatedly. Eventually, these patients establish regular menses or, as has occurred in a few instances, amenorrhea.

The presence of hyperplasia in the prepubertal or post menopausal patient must be investigated thoroughly for the possible presence of an estrogen-producing tumor. This, however, is not within the scope of the present paper.

Functional bleeding may be caused by a less widely known condition called irregular shedding. Here the abnormality is associated with the secretory phase of the menstrual cycle. The underlying cause of irregular shedding is not as well understood as in hyperplasia. There is evidence to show that there is an incomplete withdrawal of hormones at the time of menstruation. Instead of a prompt decrease of progesterone prior to bleeding, the quantitative withdrawal is gradual over several days. This prevents a complete disintegration of the endometrium, resulting in an irregular shedding of the surface and a retention of secretory endometrium. Because the previously functioning endometrium is partially retained, complete healing of the surface cannot occur. As a result of this pathological retention, the menstrual bleeding is prolonged. Diagnosis of the condition is possible only by the use of a properly timed curettage. One must do the operation after the fourth day of bleeding. It is useless to curette the patient after bleeding has stopped. Tissue properly obtained will demonstrate a characteristic histological picture in which the stroma appears contracted and darkly stained. The endometrial stroma has the appearance of breaking into small fragments. The glands retain the appearance of the secretory phase, but are usually collapsed and assume a starlike shape. Little cytoplasm will be evident, indicating a state of exhausted function.

The diagnosis of irregular shedding is suggested by a history of prolonged bleeding which occurs rhythmically and at the expected time of the menstrual period. The patients are predominately in the older age group. Younger women may exhibit this disease not infrequently following a pregnancy. One could attempt biological assays to establish diagnosis, but this is impractical. Curettage, properly timed, is the most effective means of diagnosis and treatment.

The treatment of irregular shedding by medical means has not been successful. This is not important, however, since a very high percentage of patients are cured by curettage alone. In younger women, curettage is usually followed by normal periods. In the older age group, the curettage may be followed by the resumption of normal bleeding or by the cessation of periods completely. In some instances the condition is unaffected by the curettage. Since irregular shedding is related to ovarian failure, function may be completely eliminated by x-ray sterilization. In the younger age group, the administration of large doses of estrogens after several days bleeding has been used with some success. Occasionally very severe cases require repeated curettage or hysterectomy.

In summary, specific methods for the management of functional uterine bleeding have been presented. Emphasis is placed upon the need for histological diagnosis before a definite hormone program is started. The therapy recommended is based upon the use of hormones which have no untoward side effects and are physiologically sound.

ISONICOTINIC ACID HYDRAZIDE

Isonicotinic acid hydrazide, the most recent development in the therapeutics of tuberculosis, if it proves to have a comparable effect in humans as has been demonstrated in animals—will have its important place in the treatment of tuberculosis, but also its limitations. It was two or more years after streptomycin began to play an important role before resection of diseased pulmonary tissue began to have its effect in the treatment of tuberculosis.

It is more than likely that isonicotinic acid hydrazide will have an effect in the treatment of tuberculosis that may be even greater than that of streptomycin, but up to this point clinical evidence is not available to substantiate assumptions based on animal experimentation. Basically the success of treatment now depends upon bed rest, good nursing care, graduated exercise, combined with a judicious selection of appropriate therapeutic measures, both surgical and medical, under close medical supervision in tuberculosis hospitals.—Paul S. Phelps, M.D., and Reginald C. Edson, M.D., *Connecticut State Medical Journal,* May, 1952.

President's Letter

A PAUSE FOR THANKS

Giving thanks in America is often merely a ritual which we observe annually at Thanksgiving time. Yet, the typical American Thanksgiving dinner—with turkey, dressing, cranberries, squash, mashed potatoes, rich gravy, sweet potatoes, pumpkin pie with whipped cream, and all the other trimmings—is symbolic of the land of plenty which America is today.

And, it is fitting, too, that America was the scene of the first Thanksgiving Day. But that first official day for returning thanks was vastly different from the Thanksgiving we observe today. The Pilgrims had survived a long hard year of striving to stay alive and they were genuinely grateful for all they had. Today, we have no comparable hardships to endure. Possibly, our main difficulty is sparing enough money from other luxuries to pay for our huge feast. And yet, many of us are not genuinely thankful. We generally are a nation which takes its blessings for granted.

Some may argue that this is one of our blessings—the privilege of taking our blessings for granted. As logical and true as that may appear, it is a complacent way to look at things. Merely to take things for granted admits a willingness to accept as ours the very things for which others worked and sacrificed.

We, as doctors, can give thanks for a multitude of things. We have the supreme privilege of serving our fellow men. We can be thankful for the good fortune of being educated to the profession of healing and of the ability to aid others to recover from illness, thus affording them reason to render thanks. Ours is a gratifying task.

As doctors, we must be thankful that our profession is unshackled. We can practice medicine with a maximum of freedom. We have access to the latest and best information which is readily adaptable for use for the good of others.

We can be thankful not only as a profession but as individuals as well. As Americans our list of blessings is long and varied. As individual Americans, we can still count the famed freedoms as our personal blessings. We still have the right of life, liberty, the pursuit of happiness, freedom of speech, press, religion, the right of assembly, privacy, due process of law and the privilege of casting votes for those we wish to have represent us.

With such a rich heritage the answer to the question, "Who has more to be thankful for than Americans?" must surely be "No one!" In pausing to give thanks for our many material gifts, let us ask that spiritual strength and blessings be granted us in equally abundant measure.

POLIOMYELITIS IN MINNESOTA, 1952

THROUGH October 15, 1952, 3,117 cases poliomyelitis with 151 deaths in Minnesota residents had been reported to the State Health Department with an additional 169 cases and sixteen deaths in nonresidents. The percentage of fatal cases, in residents (4.8 per cent) is the lowest of any recent year, except 1950, when 4.1 per cent of patients died. The number of cases in 1952 exceeds that of any previously reported year, although more deaths were reported in 1946 and 1910.

This year's cases include 1,705 males, 55 per cent of the total, and 1,412 females, 45 per cent of the total. This sex distribution is the same as in recent years. Fatal cases include 88 males (58 per cent) and 63 females (42 per cent). Sixty-five per cent of the cases and 47 per cent of the deaths reported occurred in children under fifteen years of age, confirming the impression that poliomyelitis is a childhood disease primarily, and that in general the majority of adults are immune, probably as a result of unrecognized childhood infection. A fatal outcome is more likely, however, in adults who do develop the disease; 35 per cent of the cases and 53 per cent of the deaths were in persons fifteen years of age and over.

Analysis of about 2,000 of this year's reported cases, as to type of involvement, indicates that 25.8 per cent of these cases were of the bulbar type; 21.5 per cent, spinal paralytic; 52.7 per cent, nonparalytic. These percentages may not be greatly different from those of 1946, 1948, and 1949, other recent epidemic years, when finally completed.

Cases of poliomyelitis this year have been distributed widely and generally throughout the entire state, with some apparent sparing of the southwest corner where a winter outbreak was prevalent in December of 1951, and January, 1952. The State total of cases is the cumulation of all the local epidemics that flare up in various communities, and the duration and final extent of the statewide problem depends somewhat on the timing of these local outbreaks. In general, six weeks of mounting reports precede the week of peak numbers, and at least nine weeks of more slowly dropping reports follow. Thus the peak week of cases in 1946, when Minneapolis was heavily involved early in the summer, was the week ending August 17; in 1948, September 18; in 1949, August 27, and in 1952, the week ending September 13. Since the peak week this year, over 1,400 additional cases have been reported, as a result of involvement of practically all areas of the State

MINNESOTA DEPARTMENT OF HEALTH—SECTION OF PREVENTABLE DISEASES
POLIOMYELITIS

Cases Reported in Minnesota Residents According to Type

Type	1946	1948	1949	1952 (thru Oct. 15)
Paralytic	63.3%	49.2%	51.3%	47.3%
Bulbar	16.7	19.8	18.5	25.8
Spinal	46.6	29.4	32.8	21.5
Nonparalytic	28.5	49.0	45.2	52.7
Unknown	8.2	1.8	3.5	

(Above figures represent only about 2,000 cases in which type is known to date.)

MINNESOTA DEPARTMENT OF HEALTH—SECTION OF PREVENTABLE DISEASES
POLIOMYELITIS

Cases, Deaths, and Rates per 100,000 Population 1946-Oct. 15, 1952

Year	Cases	Case Rate per 100,000 pop.	Deaths	Death Rate per 100,000 pop.
1946	2,881	102.3	226	8.0
1947	201	6.9	13	0.5
1948	1,387	47.2	110	2.7
1949	1,715	57.6	111	3.7
1950	502	16.9	21	0.7
1951	511	16.9	31	1.0
1952 (to Oct. 15)	3,117	103.3	151	5.0

The chief problems this year have been to find sufficient nurses to staff the facilities required to handle the rush of cases. National resources were committed to other states prior to Minnesota's need. Progress was made in utilizing more local facilities and opening up of private and other large hospitals in the Twin Cities for care of convalescent patients. Exaggerated fear on the part of the general public continues to be a real problem.

Many reports have come in of atypical illness occurring in communities at the same time cases of paralytic poliomyelitis have appeared and likewise in the absence of recognized polio. Some of these outbreaks have resembled those reported in other states where Coxsackie viruses have been demonstrated in persons with herpangina, pleurodynia, and nonparalytic neuromuscular complaints. There is great need for the provision of adequate resources to permit proper laboratory story of these outbreaks, using the steadily increasing knowledge of viruses that now exists.

D.S.L.

ANTABUSE® AND ALCOHOLISM

ANTABUSE® is the trade name of Ayerst, McKenna, and Harrison, Ltd., for its brand of tetraethylthiuram disulfide. It is offered in the treatment of alcoholism. The drug, when taken by mouth, delays the breaking down of alcohol in the blood, and when alcohol in any form is taken illness, sometimes violent in nature, results. The larger the dose of the drug taken, the more violent the reaction after imbibing alcohol in any form, and the more alcohol consumed, the greater the reaction. Illness on taking a drink is experienced as long as seven or eight days after a single dose of 1.5 grains of the drug. Also, the patient should not be given the drug until a period of two weeks has elapsed since he has had a drink. Dosages should be kept low—at 0.5 gm. or less, daily, for the first two or three weeks and at 0.25 gm. or less as a maintenance dose. It should also be remembered that individuals react differently to drugs—Antabuse® included.

The symptoms produced on taking a drink following the administration of Antabuse® are largely cardiovascular and consist of flushing, sweating, palpitation, dyspnea, hyperventilation, tachycardia, fall of blood pressure, nausea and vomiting. Usually, drowsiness ensuses with complete recovery following sleep.

It is obvious that the drug should not be given in the presence of other illnesses such as diabetes mellitus, myocardial weakness, coronary disease, pregnancy, goiter, epilepsy, cirrhosis of the liver or nephritis. Also, it should not be given to one over fifty years of age. As the action of barbiturates is aggravated by Antabuse,® they should not be given concomitantly.

How extensively Antabuse® is used, we do not know. We do know that it should be used only as an adjunct in the treatment of alcoholism and not as a specific for a certain disease. It should also be used with caution and only by the informed.

The other phases of treatment of alcoholism, such as hospitalization, psychiatric assistance and the treatment of co-existing disease, should not be neglected.

CORTISONE AND CORTICOTROPIN

Policy for Administration in Welfare-Sponsored Medical Care

AT a recent meeting of the medical advisory board of the State of Minnesota Division of Social Welfare, a revision of the policy concerning the use of cortisone and of corticotropin (ACTH) was discussed. With increasing medical experience in employing these hormones, and with increasing availability of the preparations, an attempt has been made by the medical advisory board to evaluate and facilitate their use when necessary by recipients of welfare-sponsored medical care.

Cognizance has been taken of the fact that this group of patients includes many elderly people who are recipients of old-age assistance. Likewise there are included other patients having diseases which might make the use of cortisone or corticotropin hazardous. One giving guidance in selecting patients for hormone therapy should first consider those diseases in which such therapy is contraindicated or in which if such therapy is undertaken it is done at an increased risk of a varying degree. Such diseases include tuberculosis, syphilis, latent or frank psychosis, severe psychoneurosis, peptic ulcer, hypertension, congestive heart failure, nephritis, thrombophlebitis, diabetes mellitus, pyogenic infections, pregnancy, convulsive disorders (exclusive of idiopathic hypoglycemia) and severe osteoporosis.

In many diseases the use of cortisone and of corticotropin has been shown to be of value. The medical advisory board has reviewed these diseases with respect to treatment by these hormones as a background for the policy it is here recommending.

Bronchial Asthma.—Patients having bronchial asthma may experience transitory benefit from cortisone or from corticotropin. The use of these hormones is but an adjunct to other established procedures in the management of this disease. The use of these substances is best indicated in the critically ill asthmatic patient or in one seriously ill and who is failing to respond to more conservative forms of therapy. It is doubtful if the use of these hormones is justified in most patients having other allergic diseases such as seasonal hay fever, uncomplicated vasomotor rhinitis, or less severe urticaria.

Rheumatic Fever.—The effect of cortisone and of corticotropin on the course of acute rheumatic fever has been repeatedly demonstrated. Prolonged studies will be necessary, however, before the influence of these hormones on the development and course of rheumatic heart disease can be determined. Certain studies would suggest that there is a favorable influence on acute rheumatic carditis following such therapy. It would appear that cortisone and corticotropin have no influence on rheumatic heart disease sustained in previous bouts of rheumatic fever, or on damage sustained in a given course of rheumatic fever prior to the institution of hormone therapy. With our present understanding, it would appear that the use of these hormones is well justified in many instances of the acute phase of rheumatic fever.

Rheumatoid Arthritis.—Rheumatoid arthritis is characterized by a course which varies in its extent, duration and severity. Conservative measures of therapy including physical medicine, general supportive measures, rest and certain specialized forms of treatment (for example, vaccines, fever therapy, gold-salt therapy) permit favorable control of the course of the disease in many instances. The use of cortisone and corticotropin may be considered only in those patients in whom the active phase of the disease continues to be progressive despite such treatment. Even in these instances cortisone and corticotropin will be of greatest value as a supplement to, rather than as a substitute for, basic conservative measures. Beneficial effects from hormone therapy are usually limited to the duration of their administration and a varying but usually relatively short period thereafter. Only limited if any beneficial results are to be anticipated in the treatment of structural joint changes already present as the result of previous articular inflammation. These hormones will not effect a repair of extensive joint damage once such has developed.

Osteoarthritis.—The value of cortisone and of corticotropin has yet to be established in the management of osteoarthritis, that type of degenerative joint disease constituting the vast majority of instances of so-called arthritis in patients past middle age. It would appear advisable to defer for the present the acceptance of such patients for therapy.

Dermatologic Diseases.—In certain severe dermatologic diseases and in systemic diseases commonly exhibiting prominent dermatologic manifestations, the use of cortisone and corticotropin is of value. These include the acute systemic forms of lupus erythematosus and pemphigus. Those drug eruptions and systemic reactions, especially that group occurring as an urticarial or sensitization reaction following use of antibiotics or serums, may necessitate the employment of hormone therapy if more conservative types of treatment prove ineffectual. Patients having refractory noninfectious erythema multiforme or acute severe generalizing dermatitis venenata may require the use of hormonal therapy when failing to respond to more conservative management. Under careful management the use of these hormones may be indicated in patients having extensive and severe eczema or exfoliative dermatitis which has failed to respond to usual forms of therapy.

Ophthalmologic Diseases.—Patients having certain eye diseases are helped by therapy with cortisone or corticotropin. Cortisone may be administered topically; cortisone and corticotropin may need to be administered systemically. A list of eye diseases wherein hormones may be employed with success appears in a later section.

Burns.—The use of cortisone and of corticotropin in extensive and severe burns is of particular value in the shock phase of this type of injury.

Addison's Disease.—Cortisone has been demonstrated to be effective as an adjunct in replacement therapy in patients having Addison's disease. Adrenal cortical insufficiency occurring as a part of panhypopituitarism likewise may require adrenal replacement therapy in which cortisone is useful. The employment of cortisone in replacement therapy necessitates the use of far smaller doses than those commonly employed in the treatment of other diseases influenced by this hormone.

Comment

In view of the demonstrated value of cortisone and of corticotropin in the treatment of certain patients having the foregoing diseases, the medical advisory board of the State of Minnesota Division of Social Welfare has considered it advisable to recommend to the Division of Social Welfare an extension of its policy concerning the use of these hormones. Patients who otherwise qualify for medical benefits at public expense in accordance with the Statutes of the State of Minnesota may now be eligible for treatment with cortisone or corticotropin when necessary according to the outline to follow.

In determining this outline for guidance in acceptance of responsibility in payment for cortisone and corticotropin, certain conditioning considerations have been delineated.

Certain diseases, by virtue of their rapid course, necessitate early employment of the hormones without the delays incident to securing authorization for payment for these substances. In such instances as later defined, a physician may start therapy and at that time solicit authorization for its expense from the Medical Director of the Division of Social Welfare. Prompt action will be taken on such a request. In any event, in such cases financial responsibility for the first three days of hormone treatment will be assumed by the Division of Social Welfare.

In certain other diseases not presenting an indication for the emergency use of cortisone or of corticotropin, authorization for the use of hormones at public expense should be secured in advance.

When the disease in question is one wherein a satisfactory therapeutic response may be anticipated following topical use of cortisone, relatively small amounts of the hormone are required. Illustrative of such diseases is a group of diseases of the eyes. In such instances prior authorization for the assumption of financial responsibility by the Medical Director of the Division of Social Welfare need not be obtained.

This outline, determined by physicians practicing in various sections of the state, appears to be a current equitable guide for use in a difficult problem. It is recognized that with further experience, changes in this proposed program may become necessary.

1. *Conditions wherein systemic cortisone or corticotropin therapy may be started without prior authorization for its expense,* but concerning which notification should be sent immediately to the Medical Director of the Division of Social Welfare. Liability for the cost of hormone therapy employed cannot extend beyond three days without such authorization.

(1) Status asthmaticus
(2) Acute rheumatic fever with or without associated carditis
(3) Extensive burns
(4) Systemic crises of disseminated lupus erythematosus
(5) Serum sickness (severe)
(6) Drug reactions (severe, of urticarial or sensitization type)
(7) Erythema multiforme (severe, of noninfectious type)
(8) Dermatitis venenata (acute, severe, generalized)
(9) Exfoliative dermatitis
(10) Periarteritis nodosa
(11) Pemphigus
(12) Ocular diseases which because of severity or lack of response to local treatment may require the systemic administration of hormones (for example, sympathetic ophthalmitis, acute nongranulomatous uveitis, chemical and thermal burns, posterior uveitis, retrolental fibroplasia, scleritis, acute focal choroiditis, interstitial keratitis, and late vernal conjunctivitis)

2. *Conditions wherein the liability for the expense of cortisone or corticotropin therapy will be assumed only following authorization* by the Medical Director of the Division of Social Welfare. Liability for expense of therapy cannot be assumed unless prior authorization is granted.

(1) Severe progressive rheumatoid arthritis
(2) Rheumatoid spondylitis deformans
(3) Psoriatic arthritis
(4) Nontropical sprue
(5) Idiopathic hypoglycemia with convulsive disorder
(6) Sarcoidosis
(7) Addison's disease*
(8) Panhypopituitarism
(9) Other diseases for which hormone therapy is currently being used but for which other forms of therapy permit satisfactory treatment

3. *Conditions wherein liability for the expense of cortisone employed topically will be assumed* by the Medical Director of the Division of Social Welfare. Eye diseases wherein cortisone topically administered may be expected to be of value include the following.

(1) Sympathetic ophthalmitis
(2) Acute nongranulomatous uveitis
(3) Postoperative uveitis
(4) Chemical burns of the eye
(5) Thermal burns of the eye
(6) Episcleritis
(7) Scleritis
(8) Interstitial keratitis
(9) Keratoplasty (postoperatively)
(10) Recurrent corneal ulcer
(11) Allergic blepharitis and blepharoconjunctivitis
(12) Vernal catarrh (early stage)
(13) Phlyctenular keratoconjunctivitis
(14) Acne rosacea keratitis
(15) Endophthalmitis phacoanaphylactica

Medical Economics

Edited by the Committee on Medical Economics
of the
Minnesota State Medical Association
George Earl, M.D., Chairman

WMA WOULD LIMIT SOCIAL SECURITY

A sound and sensible attitude toward social security schemes on a broad basis is presented in a recent statement by the World Medical Association. The international medical group states that "Doctors are perturbed by possible unfavorable effects of Social Security schemes on individual men and women. While they recognize that society has an obligation to help those who through nature, nurture, accident, disease and environment are handicapped in the struggle to survive, they fear the demoralizing effects of state paternalism exercised on adults."

Stating that a powerful factor in promoting good health and quick recovery from illness is a sense of personal responsibility, the WMA feels that any scheme which tends to decrease this personal responsibility is not a sound one. "The more the State does in this direction (free medical services), the less is the individual sense of obligation and responsibility," the statement says.

Lays Down Principles

The World Medical Association then goes on to recommend that:

1. When Social Security schemes are necessary, they should be developed in the closest collaboration with the medical profession. Such schemes should take into account the psychological effects on the beneficiaries of increased dependency and diminished responsibility.
2. The fundamental aim of a Social Security scheme should be to raise the individual to a level at which he can help himself. From this, it follows that:
3. Any Social Security scheme should contain elements that encourage self-reliance and a sense of personal responsibility, and that;
4. Any Social Security scheme should stress the obligation of the individual to make at least part of his contribution directly to the functioning and costs of the scheme.

The WMA stipulates that whenever medical care is provided as part of social security, the following principles should govern it:

1. Freedom of choice of physician by the patient. Liberty of physician to choose patient except in cases of urgency or hunanitarianism.
2. No intervention of third party between physician and patient.
3. Where medical service is to be submitted to control, this control should be exercised by physicians.
4. Freedom of choice of hospital by patient.
5. Freedom of the physician to choose the location and type of his practice.
6. No restriction of medication or mode of treatment by physician except in case of abuse.
7. Appropriate representation of medical profession in every official body dealing with medical care.
8. It is not in the public interest that physicians should be full-time salaried servants of the government or social security bodies.
9. Remuneration of medical services ought not to depend directly on the financial condition of the insurance organization.
10. Any social security or insurance plan must be open to the participation of any licensed physician, and no physician should be compelled to participate if he does not wish to do so.
11. Compulsory health insurance plans should cover only those persons who are unable to make their own arrangements for medical care.
12. There shall be no exploitation of the physician, the physician's services or the public by any person or organization.

NEW REPORT ISSUED ON MORTALITY TRENDS

The Bureau of Medical Economic Research of the American Medical Association has recently issued a new comprehensive report on mortality trends in the United States since 1900. Although the report is presented with the bureau's usual intensive and inclusive study of facts and figures, it offers a clear and concise picture of the mortality situation in this country. Dr. Frank G. Dickinson, bureau director, states in the report:

"The decline in the crude mortality rate from 17.2 deaths per 1,000 population in 1900 to 9.7 in 1949 understates the health progress of the last half century. While the population has doubled, the number of persons over sixty-five has quadrupled in this period."

Speaking editorially, *The Journal of the American Medical Association* said of this report:

"Although the emphasis of the bulletin is on causes of death, the numerous charts and tables combined with the penetrating analysis of mortality trends provide physicians and other students of vital statistics with a clear-cut analysis of the spectacular reductions in mortality during the past half century."

Explaining the increase in life expectancy further, the editorial stated:

"A small portion of the twenty-year increase in life expectancy at birth resulted from mortality gains at the higher ages; for example, the 22 per cent drop in mortality at ages sixty-five to seventy-four accounted for 2 per cent of the increase. . . . Life expectancy at any age reflects the mortality rates among older persons in a particular calendar year. What those mortality rates will be ten or twenty years from now cannot be discerned from any current table of life expectancy values. If the rapid rate of health progress in the United States since 1900 should be continued, our people may have longer lives than the people of any other nation."

A difference in reporting deaths accounts for some of the changes in rates in 1900 and in the present. The editorial says:

"Although the mortality rate from all causes combined has declined for every age group since 1900, the number of deaths per thousand population from heart diseases has increased for all age groups over thirty-five, from cancer for every age group, and from diabetes for age groups over forty-five. Some of these increases are the result of improved diagnoses of the causes of death and changes in record-keeping. Many deaths in 1900 that would have been attributed to ill-defined causes would, under present-day procedures, have been attributed to heart diseases, cancer, or diabetes."

Accident Rate High

The authors point out that although heart diseases account for more than five times as many deaths as accidents and twice as many life years lost, nevertheless fatal accidents in 1948, as in 1945 and in 1940, cut off more working lifetimes of the American people than any major cause of death. Accident prevention, the editorial says, lags far behind medical progress.

In noting the bulletin's tabulation of the changes in the major causes of death, the editorial reports:

"In this century the average age at death from each of the major causes of death has risen. The seven leading causes now account for three-fourths of our deaths, as compared with only one-half in 1900. Perhaps this fact accounts for some of the trend toward specialization in medicine. For the physician attending a patient in his final illness today is likely to be treating him for heart disease or cancer, whereas in 1900 it might have been any of a much larger number of diseases."

Praises Present System

In summarizing the importance of the progress noted in the bulletin, the AMA editorial ended with a final word of praise for American medicine: "We started the 20th century with many health disadvantages. The record of accomplishment set forth in Bulletin 92 provides the basic reason why physicians and other enlightened citizens should hold fast against any and all schemes to destroy our system of medical care under which this astounding record was made."

MINERS REPORT WELFARE FUND

The United Mine Workers Welfare and Retirement Fund, in its report for the year ending in June, 1952, lists expenditures of nearly $50 million for hospital and medical care benefits. The fund provided for 2,154 days of hospitalization and medical care for 215,372 beneficiaries throughout the bituminous coal mining communities. Miners, working or retired, and their families received 85.6 per cent of the benefits, with 4.1 per cent going to widows and orphans of deceased miners and 10.3 per cent to disabled beneficiaries who are being rehabilitated in specialized rehabilitation centers or in other institutions qualified to treat the less severely handicapped.

UMW Sponsors Hospital Associations

The same report also lists as a major development, a fund authorizing loans to the UMW-sponsored Memorial Hospital Associations of Kentucky, West Virginia and Virgina for the construction of hospitals in ten coal-mining areas. The miners' union hopes that construction of these hospitals will get under way during the coming fiscal year.

The sun is the greatest of remedies.—Pliny, Natural History, A.D. 77, quoted in *British Journal of Tuberculosis and Diseases of the Chest,* July, 1951.

◆ Reports and Announcements ◆

AMERICAN ACADEMY OF OBSTETRICS AND GYNECOLOGY

The First Annual Clinical Session of the American Academy of Obstetrics and Gynecology will be held December 15-17, 1952, at the Palmer House, Chicago, Illinois.

The meeting will feature six general sessions and forty-eight discussion groups of forty Fellows each. There also will be at least fifteen new scientific exhibits and about sixty technical displays.

The annual banquet Tuesday evening, December 16, will feature an address by the retiring president, Carl P. Huber of Indianapolis. The first truly national organization in its field, the Academy was incorporated August 14, 1951, and already has some 2400 qualified Fellows.

Election of officers will take place at the annual business meeting Tuesday morning.

Program chairman is Ralph A. Reis of Chicago.

AMERICAN COLLEGE OF CHEST PHYSICIANS

The nineteenth annual meeting of the American College of Chest Physicians will be held at the Hotel New Yorker, New York City, May 28-31, 1953.

Physicians who wish to present papers at the meeting should submit titles and abstracts to Dr. Arthur M. Olsen, Chairman, Committee on Scientific Program, American College of Chest Physicians, Mayo Clinic, Rochester, Minnesota.

STUDENT AMA MEETING

The annual session of the House of Delegates of the Student American Medical Association will be held at the Sheraton Hotel, Chicago, December 29-30, 1952.

Dr. Walter C. Alvarez, Chicago, will speak, December 30, on "The Disappearing Art of Diagnosing with the Eyes and Ears," and Dr. John Van Nuys, dean of the Indiana University School of Medicine, will be the principal luncheon speaker the same day, discussing "A Dean and His Problems."

MEDICAL CRUISE CONGRESS

Physicians and their families are cordially invited to make application to join the Eighth International Medical Cruise Congress of the Pan American Medical Association sailing from New York on the *S. S. Nieuw Amsterdam* of the Holland-America line on January 7, 1953.

Physicians contemplating making the trip are invited to give a scientific address at one of the morning scientific sessions held each day on shipboard. The purpose of the cruise is to combine relaxation with study and to further medical contacts between members of the profession in the western hemisphere.

This twelve-day cruise will include ports in the Caribbean. The office of the Pan American Medical Association at 745 Fifth Avenue, New York 22, New York, should be contacted for further information.

PRIZE AWARD FOR PAPER ON DIABETES

The American Diabetes Association offers a $250.00 prize to *medical students* and *interns* for a paper on any subject relating to diabetes. The paper can be a report of original studies, a biographical or historical note, a case report with suitable comment, or a review of the literature.

This incentive is particularly apropos in the field of diabetes, since Dr. Paul Langerhans made his studies of the pancreas, describing the islets that bear his name, while he was an undergraduate student in Berlin in 1869; and Dr. Charles H. Best, while a graduate student was co-discoverer of insulin in 1922.

Manuscripts must be submitted on or before April 1, 1953 to the Editorial Offices of *Diabetes:* The Journal of the American Diabetes Association, 11 West 42nd Street, New York 36, New York. The papers will be reviewed by the Editorial Board, which will take into consideration the value of the material and method of presentation in selecting the best paper.

The award of $250.00 has been made possible through the generosity of the St. Louis Diabetes Association, an affiliate of the American Diabetes Association.

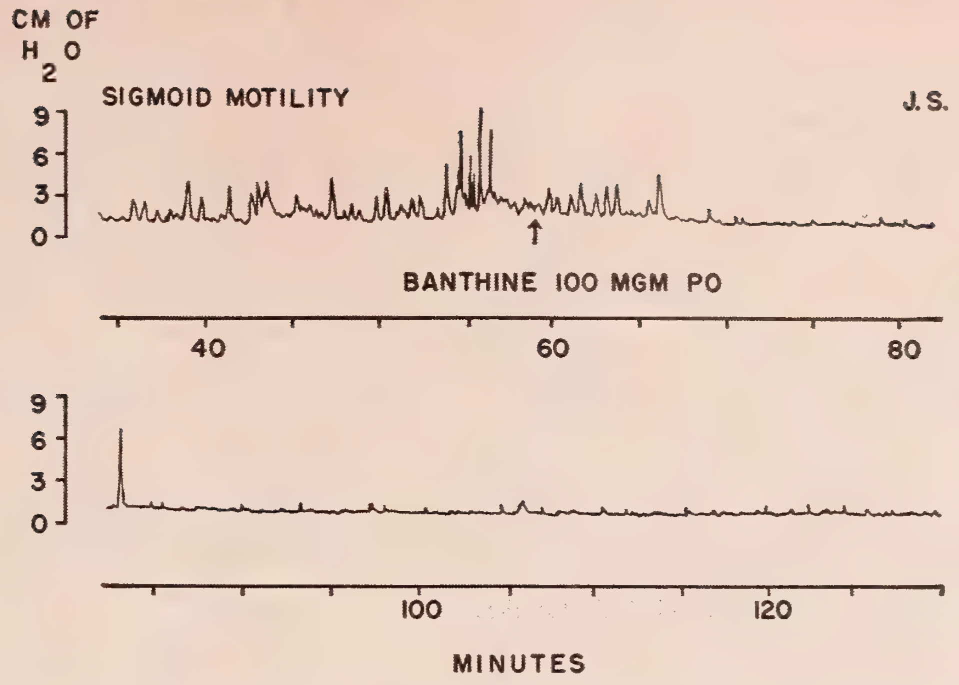
ELECTROLYTE METABOLISM SYMPOSIUM

A national symposium on electrolyte metabolism, sponsored by the M & R Laboratories, was held at the University of Minnesota, September 22-24.

Lecturers included: Dr. Daniel C. Darrow, Yale Unipersity, pediatrics professor; Dr. Willis H. Thompson, University of Minnesota, assistant pediatrics professor; and Dr. S. Danowski, University of Pittsburgh, professor of research medicine.

MINNESOTA PUBLIC HEALTH CONFERENCE

The sixth annual Minnesota Public Health Conference was held at the Saint Paul Hotel, Saint Paul, October 2-3, 1952. The meeting marked the eightieth anniversary of the creation of the Minnesota State Board of Health and was open to anyone interested in public health. At the business session, Irene Donovan, director of the Saint Paul Family Nursing Service, was elected president, replacing Dr. Charles G. Sheppard, Hutchinson; Dr. Ralph L. West, executive director of the state livestock sanitation board, first vice president; Dr. Donald R. Mackay, Saint Paul dentist, second vice president; and Allan Stone, executive director of the Minnesota division, American Cancer Society, treasurer. Dr. A. J. Chesley, executive secretary of the State Board of Health, and Dr. Harold S. Diehl, dean of the medical sciences at the University of Minnesota, were presented honorary memberships.



The effect of 100 mg. of Banthine on sigmoid motility. The contractions did not return during the experimental period.[1]

In Intestinal Hypermotility—Banthine®

> "*...has a prolonged inhibitory effect on human gastrointestinal motility....*
> *The duration of its action is striking,....*"[1]

It has also been observed that definite retardation in gastrointestinal transit time in individuals with hypermotility was attributable to the therapeutic effect of Banthine.[2]

BANTHĪNE® Bromide (brand of methantheline bromide)—a true anticholinergic—is available for oral and parenteral use.

RESEARCH IN THE SERVICE OF MEDICINE SEARLE

CONTINUATION COURSES

A continuation course in *Gynecology for Specialists* in that field will be presented by the University of Minnesota on December 15-17, 1952. The two-and-a-half day session will be held at the Center for Continuation Study on the University campus. Subjects to be considered will include endometriosis, culdoscopy as a diagnostic tool, and gynecologic malignancy including the question of carcinoma *in situ.*

Dr. Arthur Hertig,* the distinguished Professor of Pathology at Harvard Medical School, will participate in the course as a member of its faculty. The course will be presented under the direction of Dr. John L. McKelvey, professor and head of the Department of Obstetrics and Gynecology, and the remainder of the faculty will include clinical and full-time members of the staff of the University of Minnesota Medical School.

A continuation course in *Anesthesiology for General Physicians* will be presented by the University of Minnesota on January 8-10, 1953, at the Center for Continuation Study. Emphasis will be placed throughout the course on anesthesiological techniques available to practicing physicians and surgeons. Regional anesthesia will be dealt with in detail, and the management of shock will also be discussed thoroughly. A special feature will be a detailed consideration of the function and operation of a Recovery Room.

Three distinguished visitors will participate as members of the faculty for this course: Dr. Donald E. Hale, Director, Department of Anesthesiology, Cleveland Clinic, Cleveland, Ohio; Dr. Sidney O. Orth, Professor and Director, Department of Anesthesiology, and Professor of Pharmacology, University of Wisconsin Medical School, Madison, Wisconsin; and Dr. Daniel C. Moore, Chief of the Anesthesiology Section, Virginia Mason Hospital, Seattle, Washington. The course will be presented under the direction of Dr. Ralph T. Knight, Director, Division of Anesthesiology, and the remainder of the faculty will include members of the staff of the University of Minnesota Medical School and the Mayo Foundation.

SOUTHWESTERN MINNESOTA MEDICAL SOCIETY

The Southwestern Minnesota Medical Society held its first meeting in a series of four at the Worthington Municipal Hospital, September 15. The dinner meeting was attended by thirty-two doctors and their wives.

Dr. A. B. Rosenfield, director of the Division of Maternal and Child Health for the State Health Department, and Dr. Alex Barno, of Minneapolis, spoke on the maternal mortality rate in Minnesota. In comparison with studies from other states, Minnesota has one of the lowest maternal death rates.

HEALTH DEPARTMENT LAUNCHES NEW PROGRAM

The Minnesota Department of Health is launching a new type of program in professional education for physicians this fall and winter. Pathological conferences on cancer and heart disease are being scheduled as a part of regular hospital staff meetings.

During the past three years the Department of Health has sponsored seminars on heart disease and cancer throughout the state. Each consisted of a two-hour session for eight consecutive weeks. Three professional groups, physicians, dentists and nurses attended these seminars. Essentially, the method of teaching in the seminar was by means of the formal lecture with time following for questions. The conference, on the other hand, is a more informal program with greater freedom of "give and take" between the guest consultant and the audience. Hospital staffs, being smaller than seminar groups, make for closer feeling and more opportunity on the part of those attending to participate in the discussion.

The conference is led by a guest consultant who reviews with the group well worked up case histories of typical cancer and heart patients. The prime purpose in these meetings is to exchange information on diagnosis and treatment of these common every-day cases with these diseases. By means of problem presentation and questioning much information can be exchanged among those attending. Informality and free participation governs the entire sessions. Slides, x-ray film, and mimeographed material are used to supplement the presentation by the guest consultant.

The conferences are sponsored by the Minnesota Medical Association, University of Minnesota School of Medicine, Minnesota Cancer Society, Minnesota Heart Association as well as the Minnesota Department of Health.

Relaxed
but awake

In emotional and nervous disorders, Mebaral exerts its calming influence without excessive hypnotic action.

Mebaral is also a reliable anticonvulsant.

INDICATIONS:

Because of its high degree of sedative effectiveness, Mebaral finds a great field of usefulness in the regulation of agitated, depressed or anxiety states, as well as in convulsive disturbances. Specific disorders in which the calming influence of Mebaral is indicated include neuroses, mild psychoses, nervous symptoms of the menopause, hypertension, hyperthyroidism and epilepsy.

In Memoriam

JOHN A. BROBERG

Dr. John A. Broberg, a practitioner at Blue Earth, Minnesota, for many years, died October 13, 1952, at the age of ninety.

Dr. Broberg was born in Sweden, July 5, 1862, and came to this country at the age of five. He and his future wife both graduated from the University of Valparaiso, Indiana, in 1888 and they were married August 20, 1889. His medical degree was obtained from the University of Michigan medical school in 1892.

Dr. Broberg practiced at Delevan for six years before settling in Blue Earth in 1898. He retired from practice in 1942, after rounding out fifty years of service to his community. On August 20, 1949, Dr. and Mrs. Broberg celebrated their sixtieth wedding anniversary. Mrs. Broberg is still living at the age of ninety. Two daughters, three grandsons and four great-grandchildren also survive him.

Dr. Broberg was a charter member of the Blue Earth Valley Medical Society and was elected its first secretary. The pioneer physician was city health officer from 1902 until 1947.

Dr. and Mrs. Broberg liked to travel to far-away places. On one occasion they viewed the midnight sun from Fort Yukon in Alaska and a few years later from Hammerfest, Norway.

JAMES HOUGHTON DRAKE

Dr. James H. Drake, for many years a resident of Baudette, Minnesota, died at La Mesa, California, October 11, 1952.

Dr. Drake was born March 14, 1878, in Chicago. He graduated from Hahnemann Medical College in Chicago in 1903, attended the University of Minnesota and interned at Minneapolis City Hospital.

He practiced medicine in Alexandria, Minnesota, Hardin, Montana, and Hibbing before going to Baudette in 1919 as physician for the International Lumber Company. His war service included Spanish-American war duty as a private in the First Illinois Volunteer Infantry in 1898. He saw action at San Juan Hill, Cuba. During World War I he served as a captain in the medical corps. He was active in the Veterans of Foreign Wars from the time of its organization and was a leader of Peter Graham Post 2948 for many years. He was also active in the Elks Lodge and the Masonic Order.

Dr. Drake married Clarabel Moses of Alexandria, Minnesota, in 1907. His wife and a daughter, Jean, survive him.

EDWARD WILBROD FAHEY

Dr. Edward W. Fahey, Saint Paul, passed away at St. Joseph's Hospital on October 5, 1952. He was seventy-six years of age.

Dr. Fahey was born November 18, 1876, in Kingston, Ontario. He graduated from Queens Medical College at Kingston, Ontario, in 1901 and interned for twenty months at St. Mary's Hospital in Rochester, New York, before settling in Duluth in 1904. He practiced in Duluth until 1924 when he became the supreme physician for the Knights of Columbus and moved to Saint Paul. He retired in 1948.

In 1939, Dr. Fahey was made Knight Commander of the Order of St. Gregory by Pope Pius XI for his outstanding service as a layman.

Dr. Fahey was a member of the Ramsey County Medical Society, the Minnesota State Medical Association and American Medical Association. He is survived by two sons, Edward J. and John W., and a daughter, Margaret, all of Saint Paul.

SIM B. LOVELADY

Dr. Sim B. Lovelady, a member of the Mayo Clinic staff in the section of obstetrics and gynecology from 1940 to 1949, died of a heart attack October 8, 1952, at Houston, Texas. He left the Clinic in August, 1949, to enter private practice at Houston.

Dr. Lovelady was born January 11, 1909, at Danville, Alabama. He received his M.D. degree in 1934 from Tulane University, New Orleans. He was an intern at Charity Hospital, New Orleans, in 1934 and 1935. In 1935, he came to Rochester as a fellow in surgery in the Mayo Foundation and in 1939 became a first assistant in clinical obstetrics and gynecology.

Dr. Lovelady entered the medical corps of the army in August, 1942, as a major and was promoted to the grade of lieutenant colonel. He was assigned successively to the Army Medical Center in Washington, D. C., the 182nd General Hospital in New Orleans and served with the latter component in England and Ireland.

Dr. Lovelady was a fellow of the Royal Society of Medicine of England, the Central Association of Obstetricians and Gyencologists, the Minnesota Society of Obstetrics and Gynecology, Sigma Nu academic fraternity and Phi Chi medical fraternity.

Dr. Lovelady is survived by his wife, the former Mary Greer, three sons and a daughter.

OSWALD LEICHT

Dr. Oswald Leicht, for years a resident of Winona, Minnesota, died October 16, 1952, at a Sheboygan, Wisconsin, hospital following an illness of two years. He was born in Fountain City, Wisconsin, April 29, 1875. He received his M.D. degree from Northwestern University in 1898 and after practicing a short time went to London and Vienna to take spe-

cial studies in eye, ear, nose and throat diseases. He returned to Winona in 1900.

Dr. Leicht was active in musical and civic activities, having been the organizer of the Winona Symphony Orchestra in 1908 and the Winona Municipal Band in 1916. He was a past president of the Winona Board of Municipal Works and a past member of the Minnesota State Board of Medical Examiners. He was one of the oldest active members of the Winona Kiwanis Club.

He became president of the Winona Machine and Foundry Company in 1910 but continued the practice of medicine until the beginning of World War II. He then took over the active management of the foundry with his three sons.

In 1901, Dr. Leicht married Margaret Gardner. She died in 1928. His son, Joseph, died in 1949 as a result of injuries received when struck by a car. Two sons, Robert of Ramey, Puerto Rico, and Edward, of Sheboygan, survive him.

Nations like Sweden and the United States of America, which have been able to make the relatively small investment involved in a sound public-health program, have reaped a rich harvest in life capital as a result.—C. E. A. Winslow, The Cost of Sickness and the Price of Health, WHO Monograph Series, No. 7, 1951.

Of General Interest

Dr. Robert N. Barr, deputy executive officer of the Minnesota Department of Health, spoke on the status of public health in Minnesota, at the annual meeting of the Koochiching County Public Health Nursing Advisory Committee, held September 22, at International Falls.

* * *

Three new doctors in the area—**Drs. Milton Kaiser**, New Ulm, **Rueben Rayner** and **Harley Raser**, Gibbon, joined the Brown-Redwood-Watonwan County Medical Society, September 18, at the regular meeting.

* * *

Presenting papers at the American College of Surgeons meeting held in New York September 22-27 were **Drs. Yoshio Sako** and **Richard L. Varco** of the University of Minnesota and seventeen members of the Mayo Clinic staff. The Mayo Clinic members were **Drs. G. S. Baker, E. A. Banner, W. H. Bicker, H. W. Dodge, F. A. Figi, J. H Grindlay, G. A. Hallenbeck, S. W. Harrington, F. Z. Havens, E. D. Henderson, J. M. Janes, E. S. Judd, J. W. Kirklin, K. A. Lofgren, J. T. Priestley, Grace Roth** and **G. J. Thompson.**

Dr. Priestley is a member of the Board of Governors of the College and of the Committee on Graduate Training in Surgery.

* * *

Dr. Arthur H. Wells, pathologist, St. Luke's Hospital, Duluth, spoke on advances in cancer research, at a meeting of the American Cancer Society, Duluth District, September 10. Dr. Wells recently attended the Second National Cancer Conference in Cincinnati, Ohio.

* * *

Dr. D. R. Hastings, director of Glen Lake Sanatorium out-patient department, spoke to the members of the board of directors of the Hennepin County Tuberculosis Association on September 19 on nutrition needs of persons who have or have had tuberculosis.

* * *

Dr. Alfred Uihlein, Mayo Clinic neurologic surgeon, was elected to the Board of Trustees of Shattuck Military School, Faribault, in September.

* * *

Dr. J. S. Lundy, Rochester, has been appointed a member of the Mineral Springs Sanatorium Commission. He replaces John T. Lemmon in September.

* * *

Dr. Fred G. Carter, former superintendent of Ancker Hospital, Saint Paul, now administrator of St. Luke's Hospital in Cleveland, was given an award of merit for his "leadership and vision . . ." by the American Hospital Association, September 18. Dr. Carter was superintendent of Ancker Hospital from 1924 to 1935 and assistant superintendent for four years prior to 1924.

* * *

Dr. Robert N. Barr and **Helen L. Knudsen** of the State Board of Health, conducted a meeting at Cloquet, October 6, to present the hospital needs of the area to the people of Carlton County.

* * *

Lake County will be the first Minnesota county to sponsor an x-ray survey for the second time. Dr. John A. Jumer, county chairman of the survey, said that the actual x-raying will begin November 17.

* * *

Drs. William R. Blomberg and **Theron W. Nelson** of Princeton; **Drs. Ernest S. Hagquist** and **Clarence J. Henry,** Milaca, were ordered to report for preinduction physical examinations, September 26.

* * *

Eleven Twin City physicians became fellows in the American College of Surgeons, September 26. They were: **Drs. Samuel Beirstein, Lyman B. Clay, Edgar G. Ingalls, Jr., Arnold J. Kremen, Floyd J. Lewis, Virgil J. P. Lundquist, Malvin J. Nydahl, Lloyd F. Sherman, Joseph P. Spano, John P. Wendland,** and **Richard L. Varco.**

* * *

Dr. Robert B. Howard, instructor, and **Dr. Carleton Chapman,** associate professor, School of Medicine, University of Minnesota, spoke at the annual Farm Bureau Women's Short Course held at the University Farm in Saint Paul, September 9 to 12. Dr. Howard spoke on problems of the aged and Dr. Chapman on diet and disease.

* * *

Dr. H. L. Smith, Mayo Clinic staff, addressed the St. Louis Academy of General Practice at St. Louis, Missouri, September 23, on "The Movements and Sounds of Heart Valves."

* * *

Dr. Andrew A. Gage, Buffalo, New York, joined the recently incorporated Hartfiel Medical Center, in September. Dr. Gage is a 1944 graduate of the University of Buffalo School of Medicine and specialized in surgery at Meyer Memorial Hospital, Buffalo, and Veterans Administration Hospital, Batavia, New York. Dr. Gage will be located in Montevideo but will spend part of each week in Maynard.

* * *

Dr. John H. Grindlay, of the Mayo Clinic staff, is one of the three representatives of the American Medical Association named to a joint commission to undertake a study of surgical materials; data of the study to be made available to all surgeons. Others on the AMA team are Dr. Ralph E. DeForest of Chicago and Dr. I. Mims Gage of New Orleans.

Winners of Minnesota Medical Foundation scholarships were Duane Flagstad, St. James; and Maynard E. Jacobson, South Saint Paul. They and eleven other University of Minnesota medical students each re-

Migraine In Children

"Migraine may appear during the first years of life. The presence of subjective signs, such as headache and flimmer scotoma, is often difficult to determine in young children. The true nature of the symptoms frequently remains obscure for years."

Vahlquist, B. and Hackzell, G.: Acta Paediatrica *38*: 622 (1949).

NO. OF CASES	SEX	AGE AT ONSET	CYCLIC VOMITING	DURATION OF ATTACK	INTENSITY
31	8 ♀ 23 ♂	3 yrs. (mean)	3 out of 31	2½ hrs.	severe in all cases

TABLE CONT'D

NO. OF CASES	UNILATERAL HEADACHE	NAUSEA	FLIMMER SCOTOMA	VERTIGO	HEREDITY
31	18 out of 31	31 out of 31	12 out of 31	6 out of 31	20 out of 31

(reference given above)

In a study of 400 adult migraine patients, it was revealed that 34% had suffered attacks before the age of 15.* These investigators concluded that childhood migraine was a much greater clinical problem than was previously believed and that psychodynamic mechanisms played an important part in the disease.

These criteria are useful in diagnosis:

Headache attacks with symptom-free intervals plus (at least two of the following) nausea, scintillating scotoma, hemicrania, and hereditary predisposition.

For symptomatic relief in these cases, Cafergot®, N.N.R. (ergotamine with caffeine) may be administered orally. For best results, give adequate dosage promptly.

For children within the age range 7 to 12 years—Cafergot® is administered, one tablet when the attack appears imminent followed by one additional tablet within 30 minutes. Not more than two Cafergot tablets should be administered to children within this age range.

In the adolescent age group, 12 to 18 years of age, the dosage may gradually be increased as necessary up to the usual adult dose, i.e., two tablets when the attack appears imminent followed by one tablet doses at half hour intervals until the attack is aborted. *(Total maximum dose for adults: six tablets for each attack.)*

* * *

The documentary short film, "Your Doctor," has received the indorsement of the doctors in Wabasha County. **Dr. Doreen Martin,** president of the Wabasha County Medical Society, said that the film shows the problems of practicing in rural communities and the relationship of a practicing physician to his professional organizations.

* * *

Dr. A. B. Hagedorn, Mayo Clinic, spoke on the anemias to the members of the Southwestern Minnesota Medical Society and auxiliary at the regular meeting of the Society at Worthington, September 29.

* * *

Drs. Thomas J. Sisterman and **Edward P. Donatelle** opened a new medical clinic at Fifty-fourth Street and Penn Avenue South, Minneapolis, in September.

* * *

A testimonial banquet for **Dr. Harry N. Sutherland** of Shipman Hospital staff and health officer for the Ely community, was held in Ely September 30. The event was planned jointly with the Tuberculosis and Health Association of St. Louis County. Besides having presided at the births of about 3,000 of Ely's population, Dr. Sutherland was in charge of the first mobile x-ray survey conducted in the world.

* * *

Dr. George F. Lull, secretary and general manager of the AMA, was married to **Miss Mildred Louise Backman** on September 10, at Fremont, Nebraska. Miss Backman has served in a secretarial capacity for the AMA Council in Medical Service for several years. Dr. and Mrs. Lull have gone to Athens, Greece, where Dr. Lull will attend the annual meeting of The World Health Association.

* * *

An anesthetic machine was presented to the Luverne Hospital board, Luverne, September 17, as a memorial to **Dr. O. W. Anderson** who died this spring.

* * *

Dr. S. T. Kucera, Northfield Hospital staff, spoke at the annual silver tea of the Northfield City Hospital Auxiliary, September 19. Dr. Kucera accented the crowded conditions and stressed the need of enlarging present facilities.

* * *

Dr. Thomas Lowry, chief of staff at Minneapolis General Hospital, outlined the hospital's functions, organization, facilities and staff to the hospital committee, September 26. The hospital committee was organized by the Citizens League of Greater Minneapolis to study the city and county needs for a new general hospital.

* * *

Concluding more than forty-eight years of service to the community, **Dr. J. W. Preisinger,** Renville,

THE SHELTERING ARMS

Modern treatment—Staff includes Kenny trained technicians

was honored at a retirement dinner, September 15. **Dr. Robert B. Pierce,** on behalf of the Renville Civic and Commerce Association, presented Dr. Preisinger with a pen and pencil set.

* * *

Dr. Donald P. Chance, on the surgical staff of the Mayo Clinic, was married Septmember 10 to Marie Elizabeth Gartley, member of the anesthesia staff at the Mayo Clinic.

* * *

Dr. Frederic J. Kottke, director of the division of physical medicine at the University of Minnesota, spoke on aid to the handicapped at the second annual meeting of the Duluth Rehabilitation Center, Inc.

* * *

The Sheard-Sanford Photelometer Royalty Award for 1952 was presented to **Dr. Frank D. Mann,** Mayo Clinic staff, department of clinical pathology, at the meeting of the American Society of Clinical Pathologists held in Chicago, October 12-17. The award of $500 is given "in recognition of meritorious research work by a member of the society under the age of forty years."

* * *

Dedication of **Frank C. Mann Hall** in the new Medical Sciences building, Rochester, September 26, honored a career of thirty-eight years of medical research. **Dr. Mann** retired from the Mayo Clinic and Mayo Foundation on October 1.

Dr. Mann came to Rochester in 1914 to serve as director of experimental medicine at the Mayo Clinic and to take charge of the pathologic anatomy service that had been established by the late Dr. Louis B. Wilson in 1905. When the Mayo Foundation was created in 1915 as a part of the Graduate School of the University of Minnesota, Dr. Mann became assistant professor of experimental surgery and pathology. He became a full professor in 1921.

In 1932, Dr. Mann was awarded the William Wood Gerhard gold medal of the Philadelphia Pathological society, and in 1937 Georgetown University conferred an honorary degree of doctor of science on him. A year later Indiana University honored him with the degree of doctor of laws. In 1950, he became one of the only two members of the staff of the Mayo Clinic and Mayo Foundation to be elected to membership in the National Academy of Sciences. The other Rochester man similarly honored was **Dr. E. C. Kendall.**

* * *

Dr. M. M. Williams, assistant superintendent and medical director of Ah-Gwah-Ching, the Minnesota State Sanatorium near Walker, was named president of the institution by F. W. Nichols, state director of social welfare, October 1. Dr. Williams continues as medical director under the new appointment.

Dr. Williams joined the sanatorium as a staff physician in 1936, remaining there until 1943, when he left to serve in the army for four years. During

To be married, December 20, are Marilyn Clark, Duluth, and **Dr. Roger Stanley Johnson,** Deephaven. Dr. Johnson was graduated from the University of Minnesota Medical School and interned at Ancker Hospital, Saint Paul. Miss Clark is a graduate of the University of Minnesota School of Nursing and the School of Public Health.

* * *

Dr. Donald C. Balfour, director emeritus of the Mayo Foundation and professor of surgery in the Foundation, delivered the Seventh Martin Memorial lecture at the recent presidential meeting of the American College of Surgeons in Chicago.

* * *

Four doctors from the Plainview area who reported for physical examinations, September 30, prior to induction into the armed forces, were **Drs. D. G. Mahle,** Plainview; **E. W. Ellis,** Elgin; **C. G. Ochsner** and **B. J. Bouquet,** Wabasha.

* * *

Dr. William R. Jones spoke on "The Vote" when giving the outgoing president's address to the Hennepin County Medical Society, October 6. **Dr. Claude J. Ehrenberg** became the new president and Dr. Jones, chairman of the board.

* * *

Dr. J. Gordon Beaton joined **Drs. S. T. Kucera** and **G. N. Rysgaard** in their offices in the Medical Arts Building, Northfield, in September. Dr. Beaton was graduated from the University of Minnesota School of Medicine and had his internship in Baltimore. During World War II, he served with the United States Public Health Service; after the war he did graduate work in internal medicine. Before coming to Northfield, Dr. Beaton practiced for a year and a half at New Ulm.

* * *

Dr. W. F. Wilson, Lake City, was elected secretary and treasurer of the Wabasha County Medical Society for the fifty-seventh time at the annual meeting held at Plainview in October. Dr. Wilson was first elected to the position of secretary-treasurer in 1896 and has been re-elected annually ever since. **Dr. E. C. Bayley,** Lake City, was elected president; **Dr. C. G. Ochsner,** Wabasha, vice president; **Dr. B. A. Flesche,** Lake City, assistant secretary. Dr. Bayley was also named delegate to the state convention.

Speakers at the meeting included **Dr. Dorene Martin,** Pepin, formerly of Wabasha; **Drs. D. J. Erickson, Haddon M. Carryer, J. A. Bargen** and **R. L. Kennedy** of the Mayo Clinic; and **Drs. Percy T. Watson** and **John T. Smiley** of the State Board of Health.

HOSPITAL NEWS

The new **Hudson Memorial Hospital**, a fireproof building, to cost $430,000 is tentatively set to open in late November. It is located in a wooded plateau on Liberty Hill overlooking the St. Croix river and will have a capacity of thirty-two beds.

The hospital has received no government aid. Steps were taken in providing a hospital for Hudson with the establishment of the William H. Phipps Foundation by Mr. and Mrs. Stephen C. Phipps in 1946. To this sum was added a substantial gift by Mr. and Mrs. Charles A. Ward and $40,000, as well as the hospital site, by the city of Hudson.

Architects for the two-story red brick building are Ellerbe and Company of Saint Paul. The general contractor is the Olson Construction Company of Stillwater. All rooms are equipped with large picture windows and central oxygen supply is piped to each room. Static electricity is eliminated by special floor surfacing.

The new hospital will supply first-class hospital accommodations for the city of Hudson and the St. Croix valley from Stillwater to Afton.

* * *

Dedication services for the multi-million dollar enlargement of the **Medical Sciences** building of the **Mayo Clinic** and the **Mayo Foundation for Medical Education and Research** were held September 26 and 27, 1952, at Rochester.

Bronze statues of the Doctors Mayo were unveiled by Dr. C. W. Mayo, son of Dr. Charles Mayo and Mrs. D. C. Balfour, daughter of Dr. Will Mayo. The statues of the two brothers stand beside that of their father, Dr. William Worrall Mayo.

Dr. Vannevar Bush, president of the Carnegie Institution of Washington, spoke at the opening ceremony. Speakers during the dedication included Dr. Owen Wangensteen, former Mayo fellow and chief of surgery at the University of Minnesota, who talked on the impact of physiology on surgery; Dr. Lester R. Dragstedt, chairman of surgery, University of Chicago, spoke on contributions of experimental medicine to knowledge of peptic ulcers; and Dr. Chester M. Jones, clinical professor of medicine, Harvard University, and physician at Massachusetts General Hospital, Boston, spoke on the role of experimental medicine in understanding the function of the liver.

One part of the new building, now remodeled, was put up in 1941. The five-story addition with two underground levels more than triples the floor space. Most of the buildings' space is devoted to research and medical education facilities.

* * *

Dedication services for the new **St. Francis Hospital** at Breckenridge were held September 17, 1952. Dr. Roger Kennedy, president of the Minnesota State Medical Association, participated in the ceremonies along with Gov. C. Elmer Anderson, Gov. Norman

* * *

A new twenty-four bed **psychiatric center for children** at the University of Minnesota is expected to open this month. The new unit will not only provide better patient care but also a better opportunity for research, and training physicians and nurses. It will include facilities for recreational and occupational therapy.

The center was set up with a $115,000 grant from the 1951 Legislature. Dr. Irvine McQuarrie, head of the pediatrics department, said only a few states have comparable facilities. The center will be the first in the state for exclusive hospitalization of mentally ill children.

Dr. Reynold Jensen, professor of pediatrics, will be the medical director of the unit. His staff will include Dr. Jack Wallinga, psychiatrist; Wendell Quast, senior clinical psychologist, and Elsworth Stenswick, speech clinician.

* * *

Minnesota has one of the lowest rates of draftee rejection for reasons of physical, mental and moral unfitness for military service—20 per cent. Our state shares this distinction with Kansas and North Dakota. In comparison, South Carolina boys were turned down at a rate of 63 per cent, 56 per cent in Arkansas and over 50 per cent in Alabama, Georgia and Mississippi.—Christmas Seal Health News Service.

BLUE CROSS-BLUE SHIELD NEWS

Blue Shield

With revised Blue Shield contract and Schedule of Payments in effect and distributed to both physicians and subscribers on the first of October, a more active professional and public relations program is being geared for immediate action. In fact, such a plan includes talks and question and answer sessions at staff and medical meetings, a revitalized correspondence department, and the compilation and preparation of a physician's manual for later distribution. While this plan is at present in its initial and formative stages, there is already evidence of general acceptability and success.

During the program's first two weeks, three invitations were received to discuss the new benefits and contract at hospital staff, medical and group leader meetings. These assignments are covered by the medical director and either Mr. Ben Stephens, Jr., who is serving as Acting Manager of the Claims Department, or Mr. Robert Kermott, who is organizing the Professional and Public Relation section of Blue Shield. In talks already given and for those at present scheduled, formal remarks of the speaker are very brief following which those in attendance are encouraged to ask questions regarding any or all features of the Blue Shield program.

Through the past several months two meetings of receptionists, secretaries and office nurses have been held to clarify all matters of filing claims. In addition to the meetings with physicians as discussed, an effort is to be made to meet with the persons in the doctors' offices and to organize such meetings in rural districts about the state. However, further steps in this phase of the work can be taken only with additional help as the program develops.

Another feature of the present plan is the tentative reorganization of the correspondence and telephone inquiry section. All in-coming mail is being classified and routed to persons who are best trained and qualified to answer it. Mail is being answered much more rapidly with emphasis placed upon promptness and complete explanation of all contract features involved. This policy, in effect for several months, applies to all letters, those of subscribers as well as physicians. The effectiveness is apparent in that there are fewer letters of inquiry and complaint from both doctors and subscribers, and there has been some increase in the number of "thank you" and appreciation letters.

Work on a physician's and procedure manual was started several months ago. One of the first moves in this direction was the assembling of such manuals from as many other Blue Shield plans as possible. This having been done, selection, organization and preparation of material most needed and used by doctors and their office personnel has been and is under way. Final completion of this project is not in prospect for some time insofar as the material presented by such a manual will depend upon findings from a review of other such manuals, nature and volume of complaints and inquiries now and in the past received, and the impressions gained from the more active and energetic professional and public relations program.

This entire project is being developed as a co-operative and educational program for both subscribers and doctors. Its helpfulness and success will depend upon the requests and suggestions regarding it received from the practicing physicians of the state.

Blue Cross

Blue Cross has been in existence nationally since 1933, Minnesota being one of the pioneer Plans, and it was not until January 1, 1937 that enrollment nationally passed the half-million mark.

In the fifteen-year period between January 1, 1937 and January 1, 1952 the population of this country increased about 19 per cent. General hospital admissions increased, however, no less than 104 per cent, but Blue Cross membership during these fifteen years increased sixty-three times to hit the total of 38,515,000. On July 1 of this year, national Blue Cross enrollment stood at 39,462,000. That is an increase of more than sixty-four times over what it was on January 1, 1937.

Let us take a shorter perspective. Hospital admissions in the United States increased from 15,829,000 in 1947 to 18,237,000 in 1951. That is a net increase of 2,408,000 annual admissions. During these same years, Blue Cross membership in the United States increased from 27,532,000 to 38,515,000, an increase of 10,983,000 participant subscribers. For the whole span of the fifteen-year period we have considered, Blue Cross enrollment in-

creased at the rate of more than 2,500,000 new participants per year.

Fifteen years ago Blue Cross covered a fraction of 1 per cent of the American people. Today it covers 25.7 per cent of the people. If management in the Steel industry, the automobile industry, and many other industries covered by Blue Cross did not think Blue Cross the most adequate and effective method of financing hospital services; if the Farm Bureau and the Grange, the many trade associations, and the million of individuals covered by Blue Cross did not think so, could Blue Cross have grown so consistently from year to year? Could it have achieved the phenomenal manifestation of public acceptance that it has?

In 1951 Blue Cross payments to all hospitals in the United States amounted to $443,902,000. That was 26.1 per cent of hospital income. The important fact then is that while Blue Cross covered 24.9 per cent of the people, it paid 26.1 per cent of the national hospital bill. This information is furnished you in view of the interest that the Federal government appears to have in the problem of financing health services to the people. The Federal government, the nation's largest employer, the one most vocal on this problem, has yet failed to make any provision for helping its own employes and their dependents to get any kind of financing of their health needs. The Federal government has failed so far to take so rudimentary a step as the allowing of payroll deductions in order to facilitate medical-hospital group coverage for its employes.

Increasing numbers of the nation's large employers are recognizing the desirability of making a contribution to the financing of health services for their employes. Why is the Federal government so far behind private industry? Is there a wish on the part of some not to be too successful in solving by voluntary means an acute social problem that has often provided useful political ammunition?

The phenomenal public acceptance Blue Cross and Blue Shield have won in so short a time from every segment of the population shows that the people find Blue Cross and Blue Shield the most adequate and most effective method of financing hospital and medical services. Blue Cross and Blue Shield have developed a national program which uses its local strength to meet national needs. Through their many devices for enrolling every type of group, Blue Cross and Blue Shield have revealed their intention and their ability to develop into a universal system of hospital and medical service serving the whole community.

Financial

During the first eight months of 1952, $2,478,592 has been paid out by the Blue Shield Plan to doctors of medicine for services rendered to Blue Shield subscribers, and Blue Cross has paid out $8,269,971 to hospitals for services rendered to Blue Cross subscribers.

REVIEW OF PHYSIOLOGICAL CHEMISTRY. By Harold A. Harper, Ph.D., Professor of Biology (Biochemistry), University of San Francisco; Lecturer in Surgery, University of California School of Medicine, San Francisco; Biochemist Consultant to Metabolic Research Facility, U. S. Naval Hospital, Oakland; Director, Biochemistry Laboratory, St. Mary's Hospital, San Francisco. 3d ed. 260 pages. Spiral binding. Paper. Price, $3.50. Palo Alto, Calif.: University Medical Publishers, 1951.

In outline form, well indexed and with significant terms underlined, this represents the answer to the crammer's prayer. Its orderly context clear and moderately limited detail will appeal to the student, also. It is an excellent review for state and specialty board examinations.

William J. Hultgen, M.D.

ADVANCES IN PEDIATRICS. Editor, S. Z. Levine, Cornell University Medical College; Associate Editors: Allan M. Butler, Harvard Medical School; Margaret Dann, Cornell University Medical College; L. Emmett Holt, Jr., New York University College of Medicine; A. Ashley Weech, University of Cincinnati College of Medicine. Vol. 5. 273 pages. Illus. Cost $7.00. Chicago: Year Book Publishers, 1952.

This volume, like its predecessors, provides a worthy contribution to current pediatric knowledge. It consists of six articles on subjects of active interest. Three are by American contributors and three, which are on Vitamin K in relation to hemorrhagic disease of the newborn, BCG vaccination, and angiocardiographic studies, are from Denmark and Sweden. The subjects are written by those actively engaged in the field and are comprehensively covered. Particularly is this true of the article on the nephrotic syndrome in children. The remaining topics discussed are treatment of the bacterial meningitides and iron metabolism.

Pediatricians in particular will be grateful to the editors and contributors for this fine presentation of material enabling them to keep abreast of the latest information in these important fields.

Gerald I. Freeman, M.D.

RYPINS' MEDICAL LICENSURE EXAMINATIONS; TOPICAL SUMMARIES AND QUESTIONS. By Walter L. Bierring, M.D., F.A.C.P., M.R.C.P., Edin. (Hon.) with the collaboration of a review panel. 7th ed. 856 pages. Price $8.00. Philadelphia: Lippincott, 1952.

Covering the subjects of anatomy, physiology, biochemistry, microbiology, pathology, pharmacology, surgery, medicine, obstetrics, gynecology, preventive medicine and public health, and psychiatry, this book is a life saver for the busy practitioner faced with necessity of taking a basic science or medical licensure examination. Also an excellent review for comprehensives.

The various subjects are covered by members of staffs of medical schools in different parts of the United States.

The subjects are presented in cleverly condensed paragraphs which make easy reading and in such form as to be easily remembered. Coverage is surprisingly thorough. Questions at the end of each topic represent a condensation of the questions of many state examinations as well as those of the National Boards.

The editor is a former member of the National Board of Medical Examiners and is secretary of the Federation of State Medical Boards of the United States.

ESSENTIALS OF DERMATOLOGY. By Norman Tobias, M.D., Associate Clinical Professor of Dermatology, St. Louis University; Fellow, American Academy of Dermatology and Syphililogy; Diplomate, American Board of Dermatology and Syphilology. 4th ed. 596 pages. Illus. Price $6.50. Philadelphia: Lippincott, 1952.

Norman Tobias presents in his fourth edition a clear, concise and well-organized textbook of dermatology. It is intended for the use of general practitioners and medical students who have neither the time nor inclination to refer to larger standard dermatologic references. The different dermatoses are classified and grouped under different chapter headings according to clinical, anatomic, pathologic, and etiologic concepts. Diagnostic criteria are stressed as well as differential diagnosis.

Treatment is discussed for each disease and is brought up to date. Included are the indications for antibiotics, ACTH, and cortisone in certain dermatoses. A unique and very helpful feature of the book are the discussions of the nursing aspects of each group of skin diseases at the end of their respective chapters. No bibliography is available in the book. For its intended purpose as a usable brief and concise reference in the field of dermatology this book fills the bill. One caution: Because of its brevity and necessary limitations one should not expect to practice dermatology in its entirety from such a text.

Olac

Mead's powdered formula designed for both full term and premature infants

1 POUND NET (454 GRAMS)
OLAC
A High Protein Formula For Infants
MEAD JOHNSON & CO.
EVANSVILLE, IND.

gives a strong start for a healthy childhood

Excellent tissue turgor and muscle development in babies fed Olac® are clearly shown by steadily increasing clinical observations. These babies tend to gain weight without becoming fat, are sturdy, and resist infections well. They are generally vigorous, with happy dispositions. They get a *strong start* for a healthy childhood.

Designed for optimum nutrition of both full term and premature infants, Olac supplies milk protein in exceptionally generous amounts, to promote *sturdy growth*. Its fat is an easily digested, highly refined vegetable oil. Dextri-Maltose® supplements the lactose of the milk, to meet energy needs and spare protein for its essential tissue-building functions.

Convenient and simple to use, Olac feedings are prepared merely by adding water. A convenient special measure is enclosed in each can. One packed level measure of Olac to 2 ounces of water gives a formula supplying 20 calories per fluid ounce. Olac is valuable not only for bottle-fed infants but for supplementary and complementary feedings of breast-fed infants.

"diabetes mellitus
shows a marked familial tendency"[1]

the diabetic family

Every case of diabetes is a clear indication to test the patient's relatives for evidence of the "pronounced inherited susceptibility to the development of the clinical form of the disease."[1] Early diagnosis makes possible the early control and continuous treatment that are "of the greatest importance in reducing the incidence and severity of degenerative complications."[2]

diabetes in children

Testing for diabetes is especially indicated in children and youthful members of diabetic families, since "the age at onset is earlier in those cases with positive family histories of diabetes."[1] Prompt control is a significant factor in postponing or preventing vascular complications—now responsible for more deaths and debility than all other causes in patients with onset of diabetes early in life.[2]

CLINITEST

HOW TO INCREASE THE PROTEIN INTAKE

without Patient Resistance

Patient resistance is rarely encountered when **H.P.S.** *Sixty* is prescribed to increase protein alimentation. This high protein supplement was carefully formulated to insure taste acceptance even when regular feedings are refused. Prepared with water or milk, it makes a universally acceptable beverage of bland taste, not unlike that of a milk shake.

60% PROTEIN in readily digested form

Consisting of intact proteins derived from milk, soybeans, and egg, **H.P.S.** *Sixty* provides 60 per cent protein and 27 per cent carbohydrate. Three servings prepared with milk provide 95 Gm. of readily digested, biologically complete protein. Prepared with water, 3 servings provide 77 Gm. of protein. **H.P.S.** *Sixty* is indicated whenever the protein intake must be sharply increased: pre- and postoperatively, to correct nitrogen loss following burns and hemorrhage, and in hepatitis, hepatic cirrhosis, malnutrition, pregnancy and lactation, and nephrosis.

H.P.S. *Sixty*®

Supplied in 1 lb. and 4 lb. tins

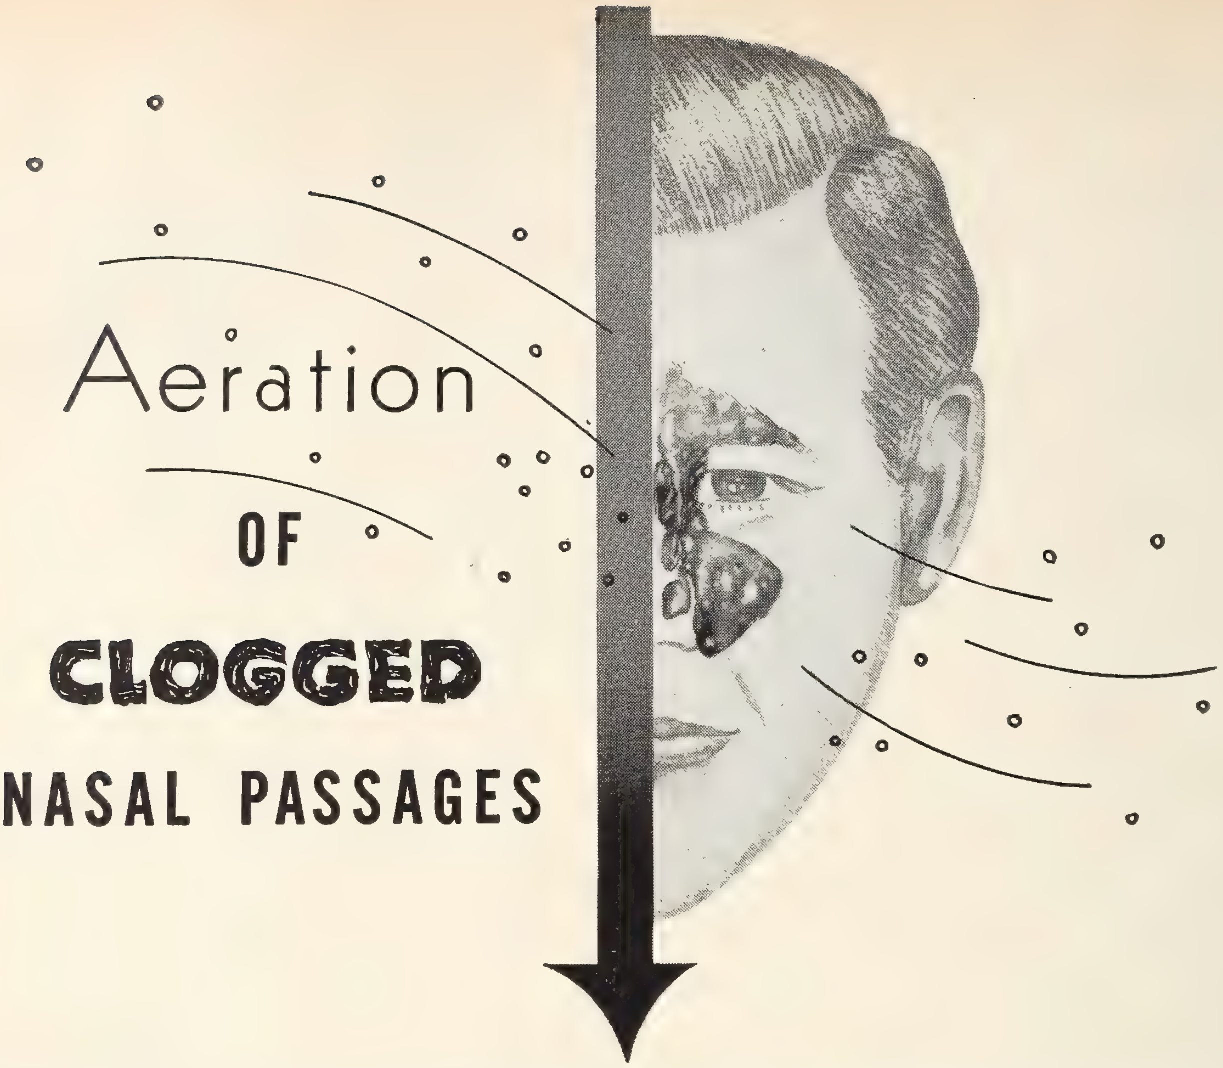
THE UPJOHN COMPANY, KALAMAZOO, MICHIGAN



Breathing comfort as well as proper drainage and aeration of the sinuses during upper respiratory infections is assured by the swift and prolonged decongestive action of

NEO-SYNEPHRINE®

HYDROCHLORIDE

By shrinking the swollen mucosa, Neo-Synephrine permits drainage of purulent matter, restoring free breathing and relieving the headache caused by clogged passages.

RAPID AND PROLONGED ACTION Clearing of nasal obstruction follows within seconds after application of Neo-Synephrine and is unusually prolonged, so that comparatively few daily applications are necessary throughout the course of a cold.

WELL TOLERATED Neo-Synephrine is notable for its relative freedom from sting, virtual absence of compensatory congestion and also has been found relatively free from systemic side effects such as nervous excitation, cardiac reaction or insomnia even when tested on hypertensive, cardiac and hyperthyroid patients.[1]

NO APPRECIABLE INTERFERENCE WITH CILIARY ACTIVITY Neo-Synephrine not only restores nasal patency, but is compatible with ciliary action.

NO DROWSINESS Neo-Synephrine may be used by the ambulatory patient without danger of producing drowsiness or related sedative action. Applied topically, Neo-Synephrine confines its action to the upper respiratory passages.

SUPPLIED:

0.25% solution (plain), 1 oz., 4 oz. and 16 oz. bottles.

0.25% solution (aromatic), 1 oz. and 16 oz. bottles.

0.5% solution, 1 oz. bottles.

1% solution, 1 oz., 4 oz. and 16 oz. bottles.

0.5% water soluble jelly, 5/8 oz. tubes.

Cordelia

AWARD WINNING BRASSIERES!

Cordelia surgical brassieres have won the Blue Ribbon for five consecutive years. Now, Cordelia has won BOTH the GOLD MEDAL and BLUE RIBBON AWARDS at the 1952 California State Fair Fashion Exhibit.

When she asks . . .

HERE ARE THE FACTS!

Most corrective, surgical and maternity brassiere problems have been scientifically solved by the staff of Physiospecialists at Cordelia of Hollywood.

THE GOLD MEDAL WINNER!

Each Cordelia brassiere is planned and made for easy, individual fittings by experts in local stores.

THE BLUE RIBBON WINNER!

Every Cordelia brassiere is a luxury in fashion fabrics — beautifully, youthfully designed. These are the facts judges took into consideration — then awarded *Cordelia the winner!*

Doctor Harris has a night out...

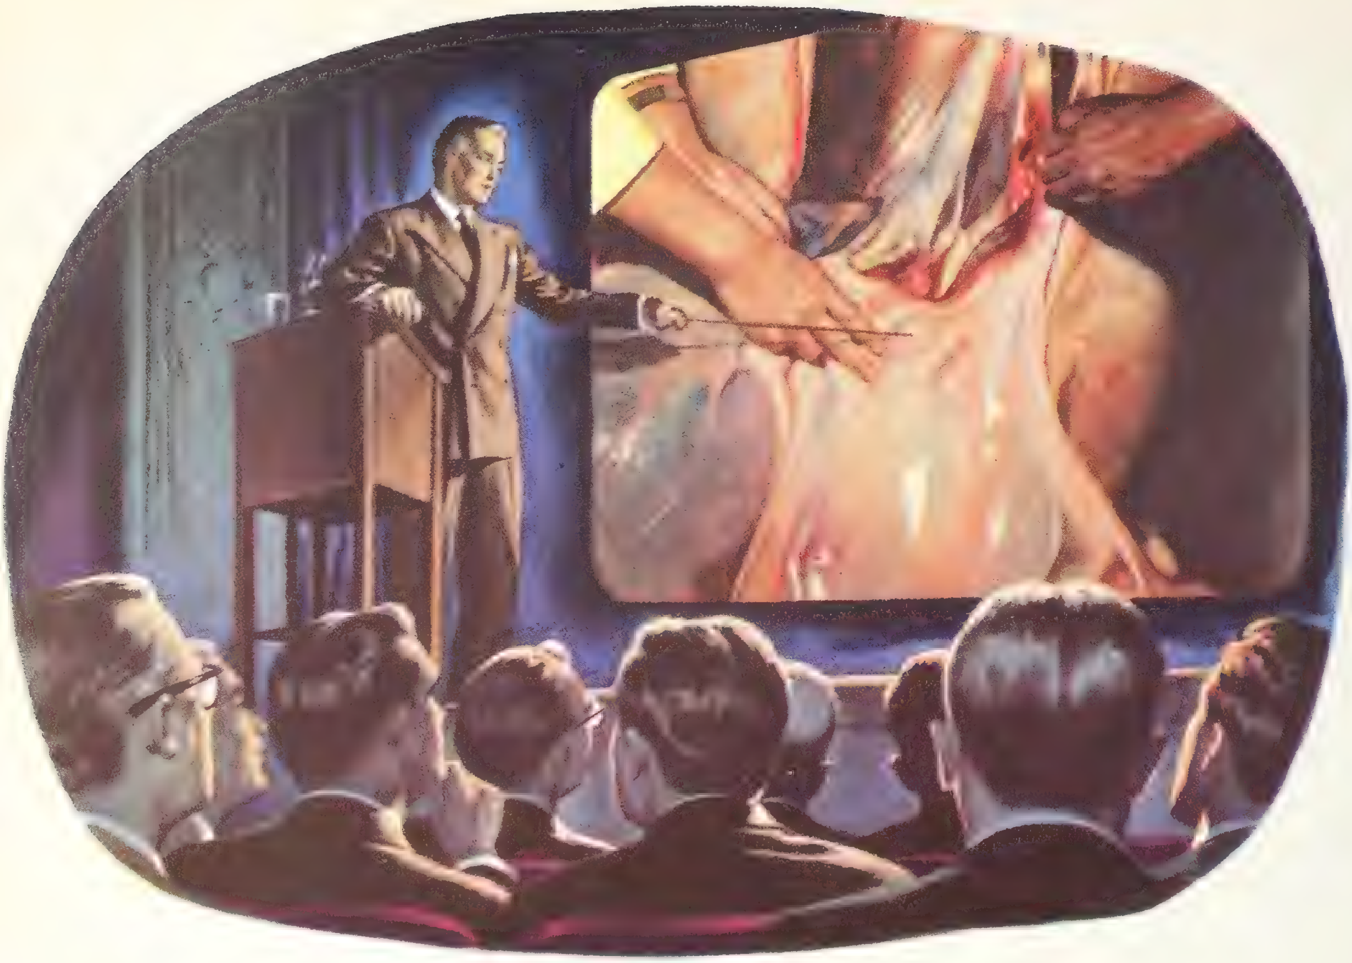
Just as the plot thickens, some patient needs his immediate attention.

Dr. Harris occasionally attempts to get a little recreation, which all too often is abruptly halted.

Although by now he is fairly well used to the idea that hardly any of his time can be called his own, he does have a little more leisure than when he was younger. Because of improved techniques and better medicines, most of his patients are getting well faster and having fewer complications.

Even as the patient is vitally dependent on the physician, the development as well as the distribution of vital medicine is dependent on the pharmaceutical manufacturer. The following example shows the extent to which one company has gone to maintain . . . →

Call State 3173
Lilly



. . . quality in quantity

In order to broaden the sources of properly handled medicinal glands, Eli Lilly and Company launched an intensive educational campaign among the nation's packing houses. Armed with aprons, knives, slides, posters, and pamphlets, a corps of Lilly experts fanned out into every section of the country to demonstrate techniques of removal and storage. Within the first year of this program, they called on over 3,000 packers. An address was made by Lilly's medical research director to the assembled members of the American Meat Institute, who pledged their vigorous support. At their request, Eli Lilly and Company furnished this organization with slides, display material, and pertinent data which they use to further this program. One by one, new sources have developed, until now the nation's supply of suitably processed glands has reached an all-time high.

RECENT ADVANCES IN RESEARCH ON RHEUMATIC FEVER

LEWIS THOMAS, M.D.

Minneapolis, Minnesota

As IN ALL unsolved diseases, we are confronted by three main problems in rheumatic fever. The first is the etiology, which we take to mean the causative agent. The second is the pathogenesis or the mechanism by which the causative agent produces the disease, and the third is the treatment. This paper is concerned with the present state of these problems.

Few diseases have been subjected to such intensive research in so many laboratories all over the world as rheumatic fever. There are two reasons for this. The first is the importance of the disease itself, as a major threat to human welfare. It has been estimated that approximately a quarter of a million people develop rheumatic fever in this country every year.[14] Paul[10] has stated that there are nearly a half million people in America with rheumatic heart disease. In the armed forces it is a formidable problem; approximately 7,500 persons developed the disease each year among military personnel during the last war.[4] It ranks as one of the chief causes of invalidism and death in childhood and early adulthood, and it contributes heavily to the mortality from heart disease in middle age. It is, in short, a major disease.

It is also an extremely complicated disease and the second factor which is a constant stimulus to research on rheumatic fever is this very complexity. It is difficult to study the disease for any length of time without becoming possessed by the feeling that it contains universals: that if we had answers to the questions that it raises we would understand a great deal about human disease in general. Another human ailment has been called the "Great Imitator." Rheumatic Fever might well be called the "Great Original." All parts of the body participate: it is a disease now of the heart, now the brain or the lungs, the kidney, the skin, the spleen, the peritoneal cavity, or the joints and it involves the blood vessels and connective tissues everywhere. It has for some students the appearance of an infection; to others it seems the result of an infection, and to others a misguided defense reaction against an infection. Its conceivable implications for other human diseases extend in all directions, encompassing conditions as unrelated as disseminated lupus erythematosis, Rocky Mountain spotted fever, malignant hypertension, eclampsia, and glomerulonephritis. It constitutes a working model for the study of all diseases of the vascular tree, perhaps including even the changes which occur in aging.

The causative agent in rheumatic fever is the group A hemolytic streptococcus. There is now quite general agreement on this point, with certain qualifications which will be considered in a moment. The supporting data is impressive. Since the initial observations made by Coburn[2] in this country and by Schlesinger[13] abroad, it has been repeatedly confirmed that rheumatic fever is preceded by group A streptococcal infection, that it is commonly associated with the presence of streptococci in the pharynx, and that it is accompanied

---

Dr. Thomas is American Legion Memorial Heart Research Professor, and Professor of Pediatrics and Medicine, University of Minnesota Medical School.

From the Pediatric Research Laboratories of the Variety Club Heart Hospital, and the Department of Pediatrics and Medicine, University of Minnesota Medical School.

Read before the annual meeting of the Minnesota State Medical Association, Minneapolis, Minnesota, May 28, 1952.

by the development of antibodies against streptococci in titers which are even higher than those usually seen in proven streptococcal infections. The latter point is illustrated by the data reported by Anderson and his co-workers[1] who studied the comparative levels of several varieties of antistreptococcal antibody in the sera of patients with scarlet fever. In one group rheumatic fever occurred as a complication of scarlet fever and these patients developed higher levels of antibody than any of the other individuals in which rheumatic fever did not occur. Much has been made of this difference in the degree of antibody response between rheumatic fever patients and individuals with uncomplicated streptococcal infections. Some have proposed that it implies an abnormal reactivity of the antibody-forming mechanism in rheumatic fever, a notion which can be fitted into the popular theory that the disease is in some way a manifestation of hypersensitivity. A somewhat simpler and equally plausible explanation might be that the patient who develops rheumatic fever has had a more extensive streptococcal infection than his non-rheumatic neighbor, and some support for this may be obtained in the serological data reported by Anderson et al.[1] The lowest levels of antibody in their study occurred in a group of patients treated with penicillin in whom the streptococcus was quickly eradicated from the throat. The next lowest were in a group in which a single type of streptococcus was present. Higher levels were present in patients with multiple types of streptococci and in those in whom streptococci persisted in the throat despite penicillin treatment. Similar findings have been described by others.[22] When penicillin is administered early and in adequate amounts, the antibody response is significantly lower than when the infection is allowed to run its full course. If patients with minimal infections, kept at a minimum with penicillin, develop minimal antibody responses, it is reasonable to suggest that patients with maximal antibody responses may have had maximal infections. This might occur without necessarily being reflected by more severe symptoms or signs of streptococcal infection. There is, in fact, no recognizable relationship between the clinical severity of streptococcal infection and the likelihood of occurrence of rheumatic fever. And there are no methods for judging the real severity or the degree of systemic involvement in streptococcal infections in human beings, other than possibly misleading manifestations such as fever, leukocytosis, or the degree of local discomfort in the throat.

This brings us to one of the great mysteries of rheumatic fever and involves us in the second of our problems, the mechanism of the disease. We have said that the causative agent is the streptococcus, but this requires a serious qualification. At the time when rheumatic fever appears, the clinical manifestations of streptococcal infection have usually subsided completely, and in some instances there is an actual latent period in which the patient looks and feels quite well, between the subsidence of the throat infection and the beginning of rheumatic fever. It is assumed by many that the streptococcal infection has actually disappeared completely before rheumatic fever develops. It is highly inconvenient to propose as an etiologic agent a microorganism which is no longer on the premises when the disease occurs. This is one reason for the currently popular theories in which rheumatic fever is accounted for on the basis of allergy or hypersensitivity. It is possible, however, that we have attached too much significance to the clinical course of the acute streptococcal infection. The disappearance of fever, or the subsidence of pain and swelling in the throat, do not necessarily mean that the streptococcal infection is at an end. Indeed, it is common knowledge that streptococci do persist in the throat for considerable periods after laryngitis or tonsillitis has healed. It is conceivable that the rheumatic fever patient may become more and more deeply involved in streptococcal infection throughout the so-called latent period, and rheumatic fever may represent a continuing streptococcal infection in which the heart, joints, skin, and other tissues are directly damaged by streptococci or the products of streptococci. It is true that streptococcal septicemia cannot be demonstrated in rheumatic fever by blood cultures, but there are two mechanisms in operation which might make it extremely difficult or impossible to demonstrate organisms in the blood. One of these is the presence of a highly effective bactericidal antibody which is uniformly found in the sera of patients with rheumatic fever,[12] and the other is a nonspecific bactericidal substance, demonstrated by Tillett,[15] which appears in the serum of acutely ill patients. Either or both of these agencies could interfere with blood cultures, especially if only occasional showers or very small numbers of streptococci were present in blood. It is also true that penicillin has not been shown to alter significantly the course of rheumatic fever, and this has been taken by some as evidence against the idea that the disease is due to a continuing streptococcal infection. However, if the microorganisms were present inside cells in internal organs, as is the case in brucellosis, it might be impossible to eradicate them with penicillin in spite of the high susceptibility of streptococci to this antibiotic.

There is an exceedingly strong piece of evidence concerning streptococcal infection in rheumatic fever which has been ignored or overlooked for many years. In 1939, Green[5] reported his findings in nine fatal cases of rheumatic fever in Edinburgh. In five of the patients streptococci had been cultured from the throat before death, and each strain was typed serologically. At autopsy, the blood cultures were negative in all cases. But Green also made cultures of whole pieces of heart tissue, including the valves, myocardium and pericardium, and he was able to grow group A beta hemolytic streptococci from the valve tissue in eight of the nine patients. Moreover, each strain recovered was shown to be serologically of the same type as previously found in the antemortem throat cultures.

Green's findings would suggest that his patients with fatal rheumatic fever actually had hemolytic streptococci infecting their heart tissues. This is contrary to all current views of the mechanism of the disease, but the only alternative explanation would be that the observations were in some way a mistake or were due to contamination. It is difficult to see how contamination could have occurred in eight out of nine tries, or involved valve tissues without also involving the blood cultures. The suggestion has been made that the streptococci made their way to the heart as an agonal event, but this also seems implausible in view of the negative blood cultures. The work of Green was confirmed in the following year by Collis,[3] at the Rotunda Hospital in Dublin, who cultured forty-two valves from seventeen patients with fatal cases of rheumatic fever and grew hemolytic streptococci from twenty-two of the forty-two. These studies deserve much more attention than they have received.

TABLE I. PERSISTENCE OF GROUP A STREPTOCOCCI IN TISSUES OF INTRAVENOUSLY-INFECTED RABBITS

Number of Days with Negative Blood Cultures	Number of Rabbits	Number with Positive Organ Cultures	Organ		
			Heart	Kidney	Liver
4	4	1		1	
5	8	2	1	1	2
7	8	2	1		1
Total	20	5	2	2	3

It is usually assumed that the hemolytic streptococcus is a highly virulent organism which, if it passes local tissue barriers, causes overwhelming systemic invasion, septicemia and death. The idea that it may cause systemic infection in a more subtle fashion, or remain dormant in internal organs without giving rise to immediate and violent tissue reactions, is a suggestion which would require much experimental evidence. Studies now in progress in our laboratory have provided some preliminary data to support this suggestion.[21] Twenty rabbits, as a group, were infected by an intravenous injection of living streptococci. Blood cultures were made in each animal every day after infection; these were positive for a few days in all instances and then became negative. After varying periods of time with negative blood cultures the animals were sacrificed, and at autopsy the heart's blood was cultured, as well as whole pieces of the heart, kidney, and liver tissues. The results are shown in Table I. In five of the animals, or 25 per cent, streptococci were recovered from one or more of the organs at a time when the blood cultures had been completely negative for four, five, or seven days. Histological study of the organs showed no lesions to suggest streptococcal infection or tissue damage. This experiment proves nothing about rheumatic fever, but it does show that the hemolytic streptococcus can take up residence in internal organs without the necessity of a coexistent septicemia, and without causing a local tissue reaction to the microorganism.

The most urgent need in research on rheumatic fever is for an experimental model with which the disease can be studied in the laboratory. If it were possible to produce the disease in animals, one could learn much concerning the mechanisms involved in the development of the tissue lesions, and, more important, new therapeutic agents could be tested in an experimental manner which is out of the question in human patients. Numerous attempts have been made by many workers, with varying degrees of success, but to date no one has actually duplicated the cardinal pathological feature of rheumatic fever, which is the Aschoff body. One approach which has been intensively studied is based on the assumption that rheumatic fever is a manifestation of hypersensitivity, because of the latent period between the streptococcal infection and the disease. Using this approach, Rich and colleagues[11] have shown that serum sickness in the rabbit, following intravenous injections of very large quantities of foreign protein, is accompanied by vascular lesions in the heart and other organs which resemble the human lesion of periarteritis nodosa. But, despite the pathological relationship between periarteritis nodosa and rheumatic fever, this animal disease is not rheumatic fever. Other workers have attempted to reproduce the disease by producing streptococcal infections in animals. The most nearly successful results were obtained by Murphy and Swift,[9] who gave repeated injections of group A hemolytic streptococci to rabbits over periods of many months. In a few of their animals myocardial lesions with some of the attributes of rheumatic carditis were encountered. In our laboratory, numerous attempts have been made to produce carditis in rabbits by streptococcal infection. With streptococci alone, regardless of the extent or number of infections, our results have been negative. Recently, on the assumption that some additional stimulus superimposed on streptococcal infection may be required to produce the disease, a series of experiments involving the generalized Shwartzman reaction[16,18] have been undertaken. The latter is a curious, unexplained phenomenon which occurs when rabbits are given two successive intravenous injections of bacterial endotoxins derived from Gram-negative microorganisms, and it consists of hemorrhagic necrotizing lesions in many organs, particularly the kidney in which bilateral cortical necrosis characteristically occurs. The mechanism of the reaction is not known, but it appears to involve damage to circulating polymorphonuclear leukocytes and occlusion of small blood vessels by eosinophilic material which resembles fibrinoid. We have found that a systemic streptococcal infection is a highly effective method for preparing animals for the generalized Shwartzman reaction. When rabbits were given an intravenous injection of living group A hemolytic streptococci, and this was followed two or more days later by an intravenous injection of meningococcal toxin, an overwhelming reaction of hemorrhage and necrosis occurred in many internal organs, most conspicuously the heart and the kidneys. The renal lesion is that of bilateral cortical necrosis, and its underlying basis is believed to be the occlusion of the glomerular capillaries by homogeneous, eosinophilic material which, histologically, is similar to fibrinoid. Rabbits which remained alive for several days after this two-stage experiment showed extensive myocardial inflammatory lesions, with necrosis of myofibers, infiltration by mononuclear cells in the vicinity of blood vessels, and fragmentation of the ground substance. Some of the cardiac lesions have closely resembled human Aschoff bodies.

The basic lesion in rheumatic fever, as in disseminated lupus erythematosis, involves the blood vessels, and what we are seeking in our experimental model is a lesion which involves vessels with some degree of selectivity. The cardiac lesions just described involved a much greater destruction of myofibers than is commonly seen in rheumatic carditis. However, when the effects of various dosages of streptococci and toxin were studied in rabbits, it was found that a rather narrow dosage range existed within which a new type of cardiac lesion occurred in a high proportion of animals. The results will be described in detail in a separate report.[19] In brief, necrotizing lesions occurred in the walls of the medium-sized vessels, with swelling of the wall, distortion and rounding of the cells in the media, and remarkable depositions of pink fibrinoid material within the wall. In addition, fragmentation of the ground substance occurred in the connective tissue surrounding the vessels, with infiltration by owl-eyed cells.

We feel that this may be a satisfactory model for the study of rheumatic fever and we propose to use it for this purpose. The vascular lesions have occurred in the majority of animals and have caused death within two or three days, so that the experiments can be easily adapted to the survey of potential therapeutic agents.

Which brings us to the third and final problem in this discussion, the treatment of rheumatic fever.

First, since they are the agents receiving the most conspicuous attention in both medical and lay publications, what is the present status of cortisone and ACTH in the treatment of rheumatic fever? A fairly large number of patients have now been treated with these hormones, in numerous medical centers throughout the country, and an elaborate co-operative study which involves several groups of workers in the United States, Canada, and England is now in progress. Although the final answer is not yet at hand there are some points about which there is already general agreement. First of all, there is no question but that cortisone and ACTH produce a dramatic beneficial effect on the painful manifestations of acute rheumatic fever. The joint symptoms, fever, and malaise disappear within a day or so after treatment is started in almost all instances. There is some question, however, as to whether this effect is significantly different from that which occurs with salicylate treatment. According to Houser and his co-workers,[6] who have compared the effects of aspirin, cortisone and ACTH in adequate numbers of young adults with acute rheumatic fever, aspirin is actually more effective against general symptoms than either cortisone or ACTH. The most important question concerns the effect on the cardiac manifestations of the disease, and it is the general feeling that several years of observation will be required before a definitive answer can be given. However, on the basis of reports that have been published by several groups of workers, it seems most probable that rheumatic disease of the heart is not cured by ACTH or cortisone, and indeed it is questionable whether these materials have any significant effect on the final outcome of rheumatic carditis, as far as valvular heart disease is concerned. To quote McEwen,[7] who has described the results obtained at Bellevue Hospital in New York, "it is probable that ACTH and cortisone do not affect the underlying causative mechanism of rheumatic fever, in spite of the fact that they so strikingly affect certain symptoms."

Until a final answer is available, it is suggested that the hormones be used only in selected cases of rheumatic fever in which the severe manifestations of the disease are not controllable by salicylates. They should not be used as routine therapy. On the wards of the Heart Hospital we have been using ACTH or cortisone only when we are entirely unable to control the disease by other measures, and it is my impression that we have not yet altered the outcome of carditis in any of our more severely ill patients who have received hormone therapy.

There are good reasons for restricting the use of cortisone and ACTH to carefully selected patients. It should be emphasized that these substances, despite the beneficial effects which they can produce, may under certain circumstances create important hazards. One of these circumstances has been shown to exist in infection. In experimental animals, treatment with cortisone or ACTH brings about a marked increase in susceptibility to infection by a variety of bacteria and viruses.[17] This effect is illustrated by experiments conducted in our laboratory two years ago in which the effect of cortisone on infection by group A hemolytic streptococci was studied in rabbits. It was found that a streptococcal infection, which is an extremely mild affair for normal rabbits, results in overwhelming septicemia and death in animals which have been treated for several days with cortisone.[8]

In addition to the enhanced susceptibility to infection by living microorganisms which is produced by cortisone, we have also shown that treated animals become extremely vulnerable to the lethal effects of certain bacterial endotoxins in doses which are innocuous in normal, untreated animals.[20] Whether these events have any counterpart in human disease is not known, but until more information becomes available it would seem prudent to limit the clinical use of the hormones to those diseases in which important beneficial effects are *known* to occur, and in which infection either does not exist or is kept under control by concurrent antibiotic therapy.

The most important item in the treatment of rheumatic fever is concerned with the streptococcus. In most children the first episode of rheumatic fever is a relatively benign affair and the incidence of disabling heart disease after a single attack is very low. The patients who get into serious trouble are those in whom repeated attacks occur, year after year; these are the individuals who become cardiac cripples. Repeated attacks of rheumatic fever are always the result of repeated streptococcal infections, and if infection can be prevented rheumatic fever can be prevented. This fact is agreed upon by virtually all students of this disease. Thus we have at hand a therapeutic possibility which is of far greater importance than the salicylates, cortisone, ACTH or anything else that may be applied once rheumatic fever has begun. The disease can be prevented, provided that certain stern conditions are accepted. Any child who has had one attack of rheumatic fever must be regarded as a rheumatic child. If he develops a new streptococcal infection, his chances of developing another attack of rheumatic fever have been shown to be at least 25 per cent, as compared with an incidence of about 3 per cent in normal children. And with each new rheumatic attack, his susceptibility to additional attacks becomes increasingly enhanced. In order to prevent streptococcal infections in such children, it is necessary to administer prophylactic sulfonamide or penicillin, daily, the year round, throughout childhood and into adolescence. This means, for some children, five or even ten years of daily prophylactic medication. The financial and social difficulties involved in such a regimen are obvious. Nevertheless, at the present time, this is the only effective method for dealing with the problem of rheumatic fever. In the rheumatic fever clinic at the Heart Hospital, we are using oral penicillin for prophylaxis, and all of our pediatric patients who have had one episode of rheumatic fever are now receiving two to three hundred thousand units of penicillin by mouth every day.

If this kind of prophylactic treatment is impossible, and under some circumstances it may be, there is one other thing that we can do to prevent rheumatic fever. Denny and his co-workers,[4] at the Fort Warren Air Force Laboratory in Wyoming, have shown that it is possible to prevent rheumatic fever by the early and energetic treatment of streptococcal respiratory infections with penicillin. This method is not entirely satisfactory because of the difficulties which are sometimes involved in making the diagnosis of streptococcal infection early enough in the course of pharyngitis or tonsillitis. Nevertheless, if the rheumatic child is closely observed for early manifestations of respiratory infection, and large doses of penicillin are begun as soon as the diagnosis is suspected, it is possible that many attacks of rheumatic fever can be prevented.

This in our opinion is the most significant recent therapeutic advance that has been made in the rheumatic fever problem, and it is of the utmost practical importance. There may be little that we can do about rheumatic carditis once it has occurred, but we can prevent streptococcal infection and therefore we can prevent rheumatic heart disease.

THE CHANGING PROBLEM OF TUBERCULOSIS IN A CITY CLINIC

Review of a Twenty-five-Year Program

ESMOND R. LONG, M.D.
Philadelphia, Pennsylvania

IN THIS PAPER I shall try to give in a summarizing fashion the tuberculosis experience of an outpatient clinic in a poor section of a large Atlantic seaboard city over the last twenty-five years. Such an account may possibly be of interest for comparison of its data with figures for the rest of the country, and particularly, I would hope, with the experience of your own community. The picture that I present may help to dispel the notion growing in some parts of the country that tuberculosis is no longer a grave public health problem.

Tuberculosis in Philadelphia

The city is Philadelphia and the outpatient clinic is that of the Henry Phipps Institute of the University of Pennsylvania. Philadelphia is not unique with respect to tuberculosis among the large cities of this country. It has the same type of dropping death rate as the rest of the nation, but the decline has taken place along a slope much higher in altitude than is the case in your own section of the United States. Our death rate from tuberculosis at present is about eight times yours. Approximately 700 deaths from tuberculosis occur annually in this city, which has a population of a little over two million, made up of 82 per cent white and 18 per cent non-white residents. Six thousand cases of active tuberculosis and 13,000 cases of supposedly inactive tuberculosis are listed in the city records. The validity of such high figures in relation to known deaths from the disease may be open to question; I can only say that various case finding programs have long been in operation and the figures are from the city's official records.

The City of Philadelphia is divided into districts for the public health care of tuberculosis. Each of these has a tuberculosis clinic with a part time medical and full-time public health nursing staff, whose primary objectives are the discovery of new cases of tuberculosis, referral of discovered cases to proper institutions for their treatment, and follow-up supervision of patients and their contacts in their homes.

Outpatient Clinic of Henry Phipps Institute

The Henry Phipps Institute, although a voluntary organization, operates one of these district clinics. In passing, special mention might be made of this rather unusual arrangement. At relatively small cost to the city this private organization has assumed part of the city's load, fulfilling exactly the same responsibilities as the other city tuberculosis clinics, but carrying out its task with funds secured for the most part from other than official sources. This seeming generosity is motivated by the sincere desire to promote progress in tuberculosis control and learn facts on the epidemiology and prevention of tuberculosis through academic methods not practical in the routine operation of an ordinary municipal clinic.

The outpatient clinic of the Institute is supported by (1) a designated share of the Institute's endowment, (2) a substantial grant from the Community Chest of Philadelphia, (3) the full co-operation of the Philadelphia Tuberculosis and Health Association and (4) a subvention in terms of personnel from the city istelf, derived in turn from state aid funds from the federal Public Health Service. It has a staff of ten full time or part time physicians and twenty full time public health nurses.

The outpatient clinic of the Institute is in essence a case finding organization, with well organized machinery for family supervision. Some 3,200 families are on its rolls for active supervision. Approximately 5,200 home visits a year are made by its public health nurses, and about 15,000 visits at the Institute are made annually by the Institute's patients.

Within the large group of persons visiting the Institute each year for observation or care a not inconsiderable number of new cases of tuberculosis are discovered. Diagnosis is effected by the usual methods of symptomatic and contact history, physical and x-ray examination and lab-

Seventeenth annual John W. Bell Tuberculosis Lecture presented by the Hennepin County Tuberculosis Association before the Hennepin County Medical Society, April 7, 1952.

oratory studies. All active cases found are reported promptly to the City Health Department. Cases of undetermined activity are followed up at regular intervals in the effort to classify them as active or inactive. Active cases are referred in so far as possible, according to their type, to the city's general hospital or the tuberculosis hospitals of the State of Pennsylvania.

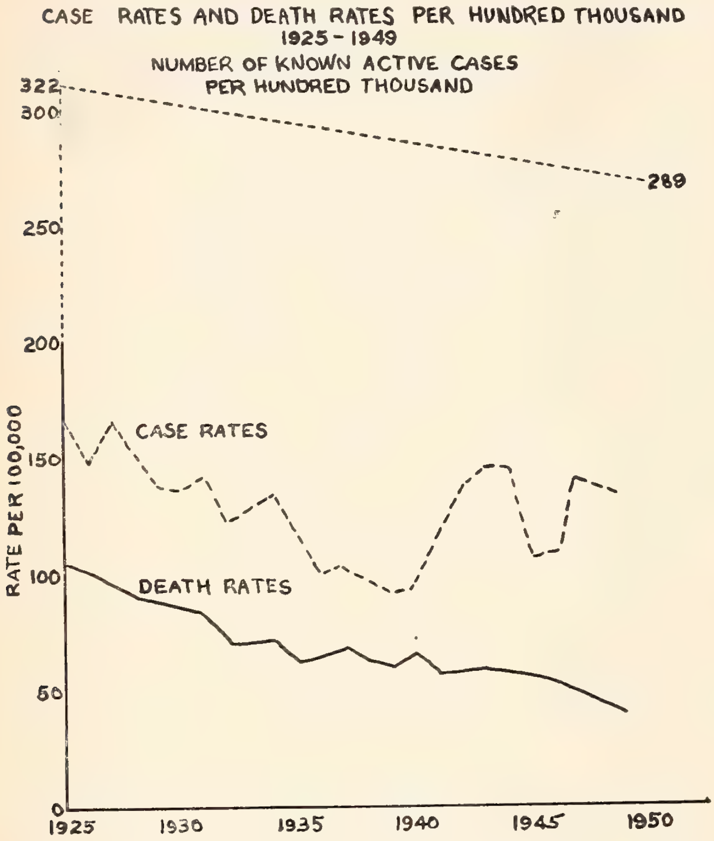

Fig. 1. Tuberculosis case and death rates in Philadelphia.

Unfortunately under present circumstances referral of cases has become theoretical rather than actual. For many months the city and state hospitals for tuberculosis have been filled to capacity and the city is left with a large and growing waiting list of patients gravely in need of hospital care. The shortage of beds is particularly acute in the case of males. About 450 persons, seven-eights of whom are men, are waiting for a hospital or sanatorium bed in Philadelphia at the present time.

A curious anomaly exists in the fact that it is still possible to force patients into hospitals for the care of their disease. Like a number of other cities of this country Philadelphia has legislation for the compulsory isolation of recalcitrant tuberculosis patients who are proven to be a menace, from the point of view of contagion, to the community.

Figures from Board of Education.

Philadelphia Tuberculosis Mortality and Infection Rates

The death rate from tuberculosis has dropped steadily over a period of many years. Figure 1 illustrates the drop in mortality rate for the second quarter of the twentieth century, which is the period here reviewed. The figure also shows the annual new case rate which, although it has fluctuated notably in recent years, probably as a result of varying opportunity and intensity of effort in case finding, has on the whole declined. It will be noted that the known total active case rate decreased only slightly from 322 to 289 per hundred thousand population.

For comparison it is of interest to note a dropping infection rate as shown by the results of the tuberculin test in school children in two representative years twenty years apart (Table I).

Twenty-five Years' Experience in Epidemiology of Tuberculosis

This brings me to a more detailed consideration of the experience of the chest clinic of the Henry Phipps Institute. The district controlled from the point of view of tuberculosis by the Institute is comprised of a segment of southeast Philadelphia and a smaller area in the southern part of north Philadelphia, with a total population of approximately 200,000 persons. The district in the Institute's charge has not been exactly the same over the total period of twenty-five years which we are considering, so that the figures I shall furnish do not have the full statistical value we would wish for comparative purposes. They are fully representative simply of the experience of the Institute itself. They are of value, even for comparative purposes, however, as an indication of the operation of a typical, well organized case finding agency, devoted to its task over a period of a quarter of a century, making full use of all the methods, techniques and new equipment that have become available within that length of time.

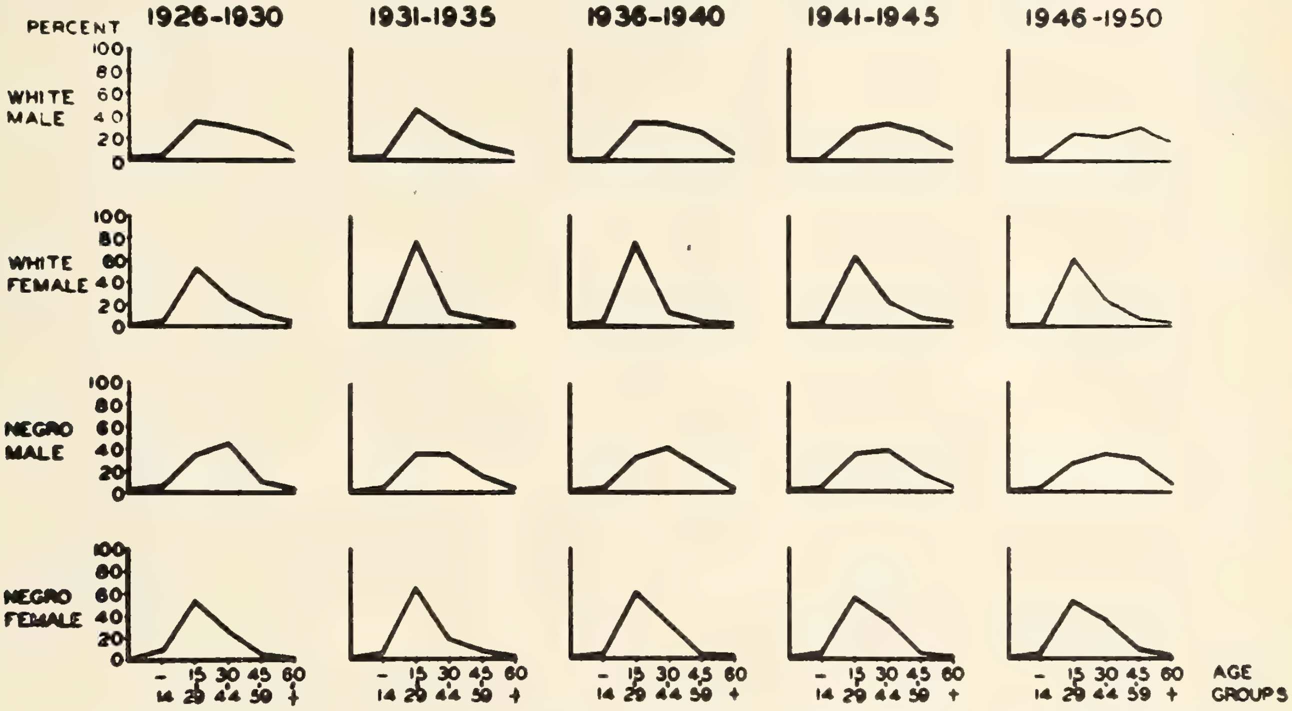

Fig. 2. Percentage of active tuberculosis at diagnosis by sex and race in five-year periods by age groups.

Since the size and character of the district have not changed profoundly they have some statistical value as well.

At this point I shall say that the figures I give are rough ones within the limitations to which I have referred. More nearly exact calculations are being made at the present time of certain large blocks of census tracts within the total district, which, it is hoped, will yield data of full comparative statistical significance.

Table II summarizes the discovery of new cases at the Institute by case and sex for the period 1926-50. It will be noted that a significant decline has taken place in the twenty-five year period in the number of new cases in whites, while a notable rise has occurred in the number of Negro cases, and that the total number of new cases discovered in each five-year period has generally increased. Table III is added to give an easy view of the trend in whites and Negroes by individual years from 1935 to 1950. The table speaks for itself. It is an illuminating and I believe characteristic, illustration of the changing complexion of an outpatient tuberculosis clinic in an underprivileged area of a typical large eastern city.

The figures on which the tables are based represent a combination of effort by the clinical and public health nursing staffs of the Institute. The great majority of the all-important final diagnoses for the total period were made by Dr. H. W. Hetherington, Chief of the Chest Clinic.

For our immediate purposes we should note that the tuberculosis load in a tuberculosis clinic of this city, whatever may be the reason for it, is as large today as it was twenty-five years ago. Many questions come to mind in seeking an explanation of this fact at a time when the tuberculosis mortality rate is unmistakably dropping. Is there an actual increase in the number of cases, or is the apparent increase simply a reflection of better case finding? Are we dealing simply with an accumulation of cases, dependent on better case finding and longer life in the cases discovered? Is the high rate to be explained chiefly on the basis of an increase in the percentage of non-whites in the population?

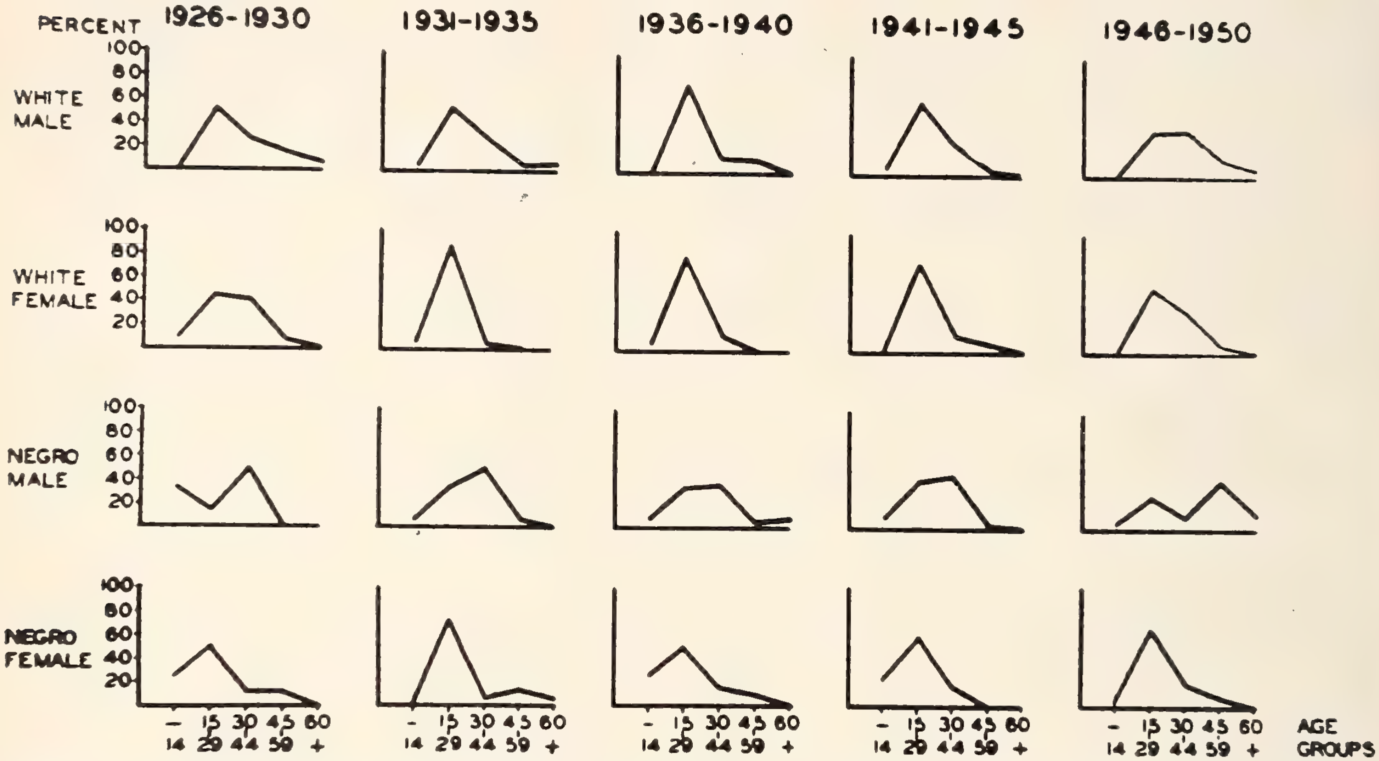

Fig. 3. Percentage of active tuberculosis in minimal stage at diagnosis by sex and race in five-year periods by age groups.

In the attempt to find an answer to these questions it will be of value to make certain breakdowns of the gross data, particularly on the basis of sex, color, age and stage of advancement of the disease at the time of discovery.

Figure 2 summarizes the percentages of active tuberculosis by sex, race and age, in five-year periods for the quarter century under consideration. It will be seen that percentage-wise no significant change has occurred in the distribution of cases by age at discovery in the female sex, although, as I have already indicated (Table III) the actual number of cases in white females decreased greatly.

In males, on the other hand, a significant change has occurred. In both white and Negro males the curve of age at discovery has tended to flatten with removal of a peak in early life and establishment of a plateau in later life. This finding is quite in accord with the well known phenomenon of increase in the average age at death from tuberculosis in the male population.

Figures 3 and 4 illustrate the same problem from the point of view of stage of disease at the time of discovery. No startling differences are evident when the total cases are separated into minimal and advanced (i.e., moderately and far advanced combined). Again the curves are essentially of the same character throughout for females, and again the curves for males have changed from a characteristic early peak to a late plateau. The curves for advanced cases are essentially the same as for all cases combined, for the simple reason that the majority of cases discovered have always been in the advanced stage.

The fact that the percentage of cases discovered in the minimal stage has not increased significantly in the last twenty-five years is, needless to say, a cause for profound disappointment. It might have been expected that much better results could have been secured with twenty-five years of improvement in procedures for case finding. The objective facts are summarized for convenience of examination and economy of space in Figure 5, in which a comparison is made of the first with the second half of the twenty-five-year period. In brief the figure shows that (1) the total number of cases has gone down in both male and female whites and risen in both male and female Negroes and (2) that the percentage of cases discovered in the minimal stage did not vary profoundly in the four sex-color groups in the two halves of the total period. Perhaps there is some significance in the fact that

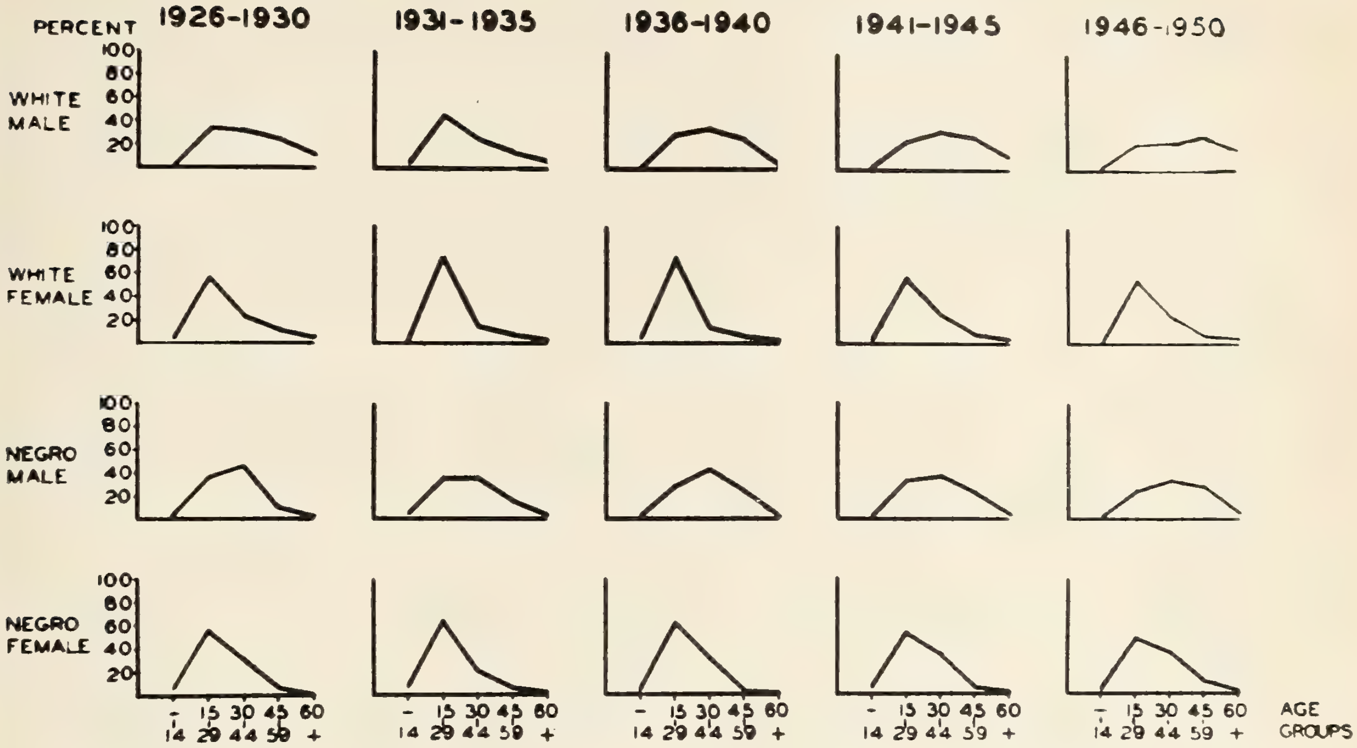

Fig. 4. Percentage of active tuberculosis in moderately and far advanced stages at diagnosis by sex and race in five-year periods by age groups.

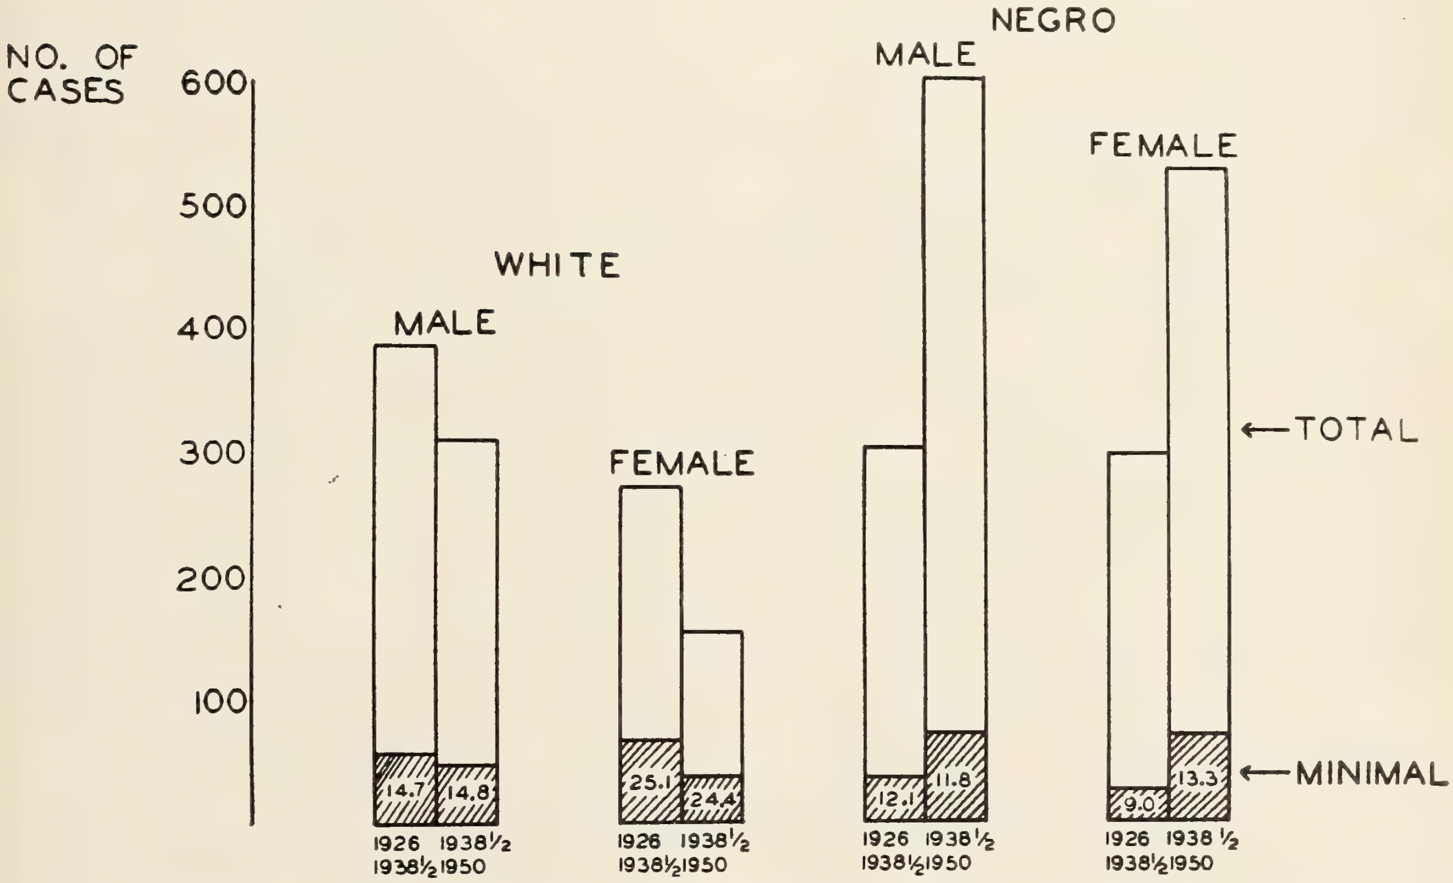

Fig. 5. Percentage of active tuberculosis by stages at diagnosis by sex and race in twelve-and-one-half-year periods.

a relatively high, although still actually disappointing low, percentage of minimal cases was found in white females.

Why more cases are not discovered in the minimal stage is an unsolved problem, in the face of which we can only bow our heads in shame. It was thought that some light might be thrown on the question by a study of the median age at diagnosis. Facts of some significance were indeed discovered. Figure 6 shows that the median age at diagnosis has risen slowly through the years in males, but not significantly in females. This fact is perhaps merely another facet of the picture exposed in Figures 4-6.

It was hoped for a time that a study of origins of the population with respect to residence in the area would be illuminating. It might be supposed that the population in which the disease developed had come to the district relatively recently and brought their disease with them. The facts do not seem to bear this supposition out. Figures are available at present only for residence in the state, not for residence in the district, but these figures, which are accurate as far as they go, do not suggest that recent immigration of Negroes from the South is the explanation of the problem. Figure 7 shows that only 5 to 10 per cent of the white persons and 12 to 22 per cent of the Negroes who were found to have tuberculosis had lived in the State of Pennsylvania less than five years.

As a side point, the fluctuation in percentage of patients with respect to length of residence in the state is of considerable interest. Those skilled in the study of migrations on the basis of economic conditions will probably be able to demonstrate correlations between the figures and opportunities for employment, in the two race groups, with special reference to depression and war time conditions and the general phenomena of industrial activity.

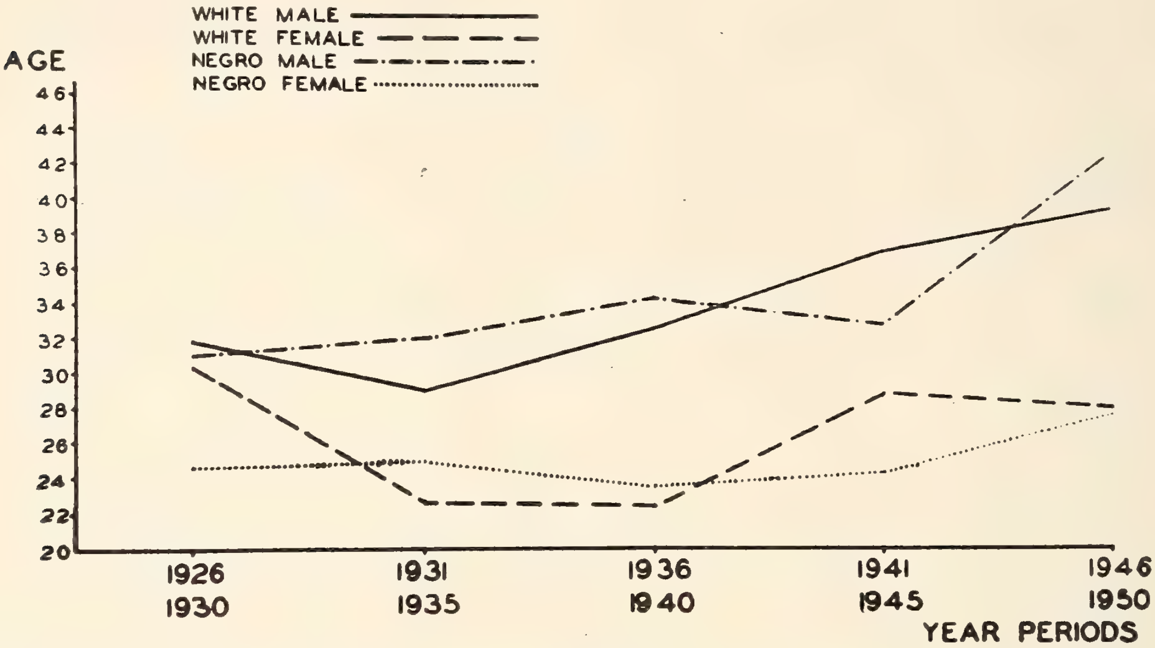

Fig. 6. Median age at diagnosis of active tuberculosis by sex and race in five-year periods.

Home Treatment—Substitute Measure in Bed Shortage

Obviously the data brought before you for consideration are disturbing in their general import. The system is not working well if we have a right to expect a steady decline in the total number of cases in the neighborhood and an increase in the percentage of cases discovered in the minimal, curable stage. We deplore the facts, while not being able to explain them satisfactorily. In the face of the serious bed shortage certain practical measures have to be taken to prevent a bad situation from becoming worse. Every method that can be brought to bear through public health nursing education in families of low economic state in tenement homes in the effort to prevent spread of infection, is made. Under the conditions the results are far from satisfactory. The fact remains that some hundreds of patients with positive sputum, who should be in tuberculosis hospitals, are at home not getting better themselves and exposing others at the same time.

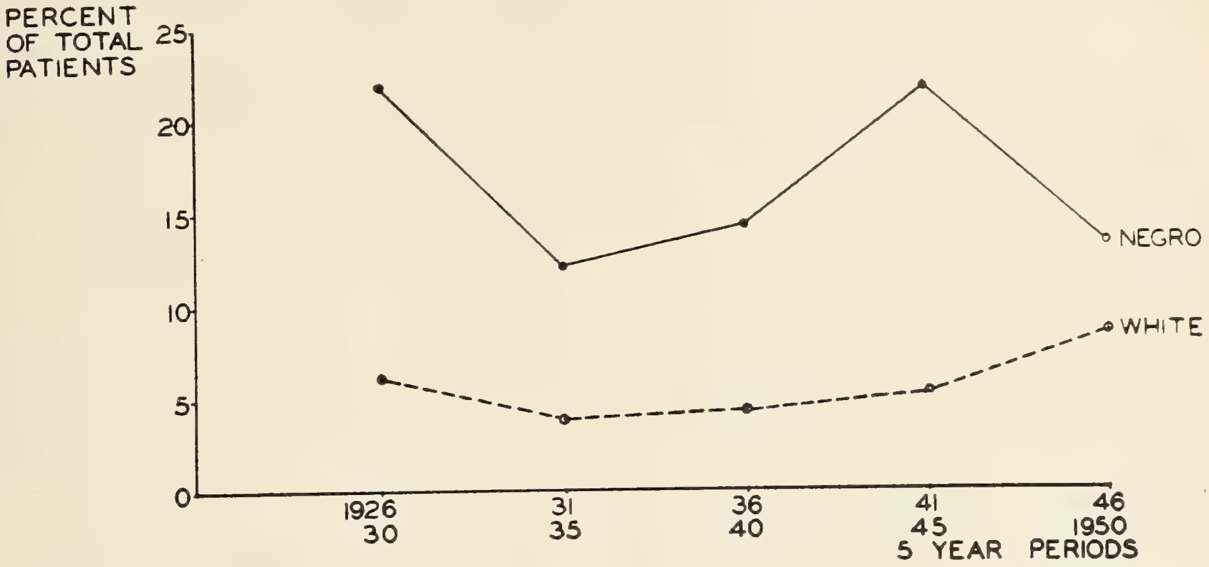

Fig. 7. Percentage of total Henry Phipps Institute white and Negro patients with active tuberculosis residing in Pennsylvania five years or less when diagnosed.

You will not be surprised to learn that under the circumstances we have turned to chemotherapy as a measure of possible value in the control of the disease in the homes. We have done this in spite of a firm conviction that the drug treatment of tuberculosis is carried out most effectively in hospitals, and least effectively on a home basis under the conditions of training in the type of population for which we are responsible.

In practice, cases are brought up for consideration at medical staff conferences, and a regimen of 1 gm. of streptomycin twice a week and 12 gms. of para-aminosalicylic acid daily is prescribed for cases considered suitable for chemotherapy. Patients who are judged to be semi-ambulant come to the Institute for their streptomycin injections. Those who are too sick receive the streptomycin treatment from our public health nurses in their homes. Each patient is responsible for his own administration of para-aminosalicylic acid, which is furnished by the Institute in adequate amount for a period ahead. Both drugs, I may say in passing, are provided to the Institute through the interest and generosity of Merck and Company, who are anxious to determine if they are effective under the existing conditions.

I am sorry to say that in general the results have been disappointing. In about three quarters of the cases the type of improvement with which we are all familiar in hospital and sanatorium practice has not occurred. In the majority of cases the patients' tubercle bacilli have become resistant to streptomycin, and progression of the disease after temporary improvement has been common.

We believe that failure to take the prescribed para-aminosalicylic acid, which occurs even under sharp scrutiny in hospitals, is partly responsible for the poor results. But probably no single explanation applies. Failure to observe prescribed rest hours is perhaps equally important. In the generally improper, unhygienic conditions prevailing, streptomycin and para-aminosalicylic acid have proved relatively feeble weapons.

This brings me to another question that I was asked to discuss briefly. That is the possibilities for a more successful chemotherapy of tuberculosis with the newly reported drugs of the isonicotinic acid series. The manner of announcement of these drugs, which proved beyond the control of those most concerned in their study, was unfortunate, particularly as it raised exaggerated hopes of the potency of the drugs in the minds of many very sick patients. After the first hysterical outburst, to which even the most conservative elements of the public press contributed, scientific investigators in increasing numbers developed a broad program of investigation which has had all the benefits of the several years of study of streptomycin and its effects, proper dose regimens and general usage.

So much has been said about these drugs that there is no point in my digressing further here as to their origin in the course of current investigations or their chemical composition. It is worth while to point out that in laboratory and animal studies they have proved to have a bacteriostatic power for the tubercle bacillus comparable to and possibly even superior, to that of streptomycin. In man they have been shown to have remarkable efficacy in relieving symptoms in pulmonary tuberculosis and arresting the one time inexorable advance of miliary tuberculosis and tuberculous meningitis. It is too early yet to make definite statements on their ability to arrest the various forms of pulmonary tuberculosis.

It is almost universally agreed that they effect no miracles, that they will not do away with the need for tuberculosis hospitals, or, in the foreseeable future at least, materially lessen the period of hospital treatment required for the kind of pulmonary tuberculosis that the bulk of our patients have. They represent undeniably a great step forward, and their value may increase as we know more of effective dosages, and useful combinations with other drugs. Possibly they will prove of value in the problems I have just described. Present indications, however, indicate that they are only new tools, like streptomycin and practical surgery, and that the fundamental principles of hospital care and improvement in environmental conditions will continue to apply in solving the tuberculosis problems in benighted areas of big cities.

Summary

1. Philadelphia, like other large cities of this country, has experienced a dropping tuberculosis mortality rate, but has a persistently high prevalence of known cases of the disease.

2. Large outpatient tuberculosis clinics in such cities, as exemplified in the Chest Clinic of the Henry Phipps Institute of the University of Pennsylvania, have as many patients with active tuberculosis on their rolls today as twenty-five years ago.

3. Certain qualitative changes have taken place, however, in the group character of the patients on the rolls. At the Henry Phipps Institute clinic, which is believed typical of well organized city chest clinics in the big cities of the Atlantic seaboard, the number of white patients has decreased sharply, while the number of Negro patients has increased correspondingly. White males outnumber white females two to one, while the number of Negro patients in the two sexes is equal.

4. In spite of a growing intensity in case finding measures the majority of cases discovered are in an advanced stage. About 15 per cent of cases are discovered in the minimal stage in white males, 25 per cent in white females, and 10-15 per cent in both male and female Negroes.

5. The median age at discovery has gone up in males, both white and non-white, from thirty-two to forty years during the second twenty-five-year-period of the twentieth century, but the median age at discovery in females, in both races, has remained stable during this period at about twenty-six years. It is remarkable that there is a sex, but not a race difference in this respect.

6. The current large accumulation of cases in the region comprised in this investigation is not due to immigration or other known variable factors. Rather, it seems due to a persistence of those environmental conditions which throughout the years have favored the development of tuberculosis in underprivileged areas. A prevailing shortage of beds for the care of tuberculosis is an important factor in the continuation of tuberculosis as a public health problem. The use of chemotherapy on an outpatient basis has not proved a satisfactory substitute for the now generally approved principles of hospital care for tuberculous patients.

7th and Lombard Streets

Tuberculosis continues to exert a greater influence upon the health and welfare of mankind than does perhaps any other infectious disease. It is a disease which frequently occurs during the early adult years of life and significantly during the economically productive years. Tuberculosis affects not only the patient as an individual but also influences the patient's entire family. The future activities and the social progress of the patient and his family are frequently altered, sometimes for better and sometimes for worse. As a truly clinical disease, tuberculosis continues to be one of the most frequently missed diagnoses.—James M. Blake, M.D., *New York State Journal of Medicine,* Feb. 1, 1952.

THE TREATMENT OF THROMBOPHLEBITIS

FREDERICK M. OWENS, JR., M.D.
Saint Paul, Minnesota

> The clotting of the blood is an essential physiological process without which man cannot long survive. In its absence the slightest injury resulting in hemorrhage permits bleeding to continue until the individual is exsanguinated. It is, therefore, a paradox that more human beings over the age of fifty die as a result of intravascular clot formation than from any other single pathological mechanism."

UPON this note Marple and Wright[5] have opened the introduction to their new book on thromboembolic conditions. With the same note we may enter into today's discussion of the treatment of thrombophlebitis.

The present day concepts of blood coagulation differ little from those held for many years but repetition of these is worthwhile. Four general factors seem to be paramount. The first is altered coagulability of the blood. This mechanism is not well understood but undoubtedly has to do with chemical changes in the blood affecting the formation of thrombin and fibrin. The second factor is increased agglutinability or adhesiveness of platelets. Studies done in my laboratory using the technique of Wright[9] reveals a definite increased agglutinability of platelets in thrombotic disease. Others have confirmed these findings. The third factor is change in the rate of blood flow. Slowing of blood flow allows the platelets and white cells to accumulate at the periphery of the blood stream where they occupy a position ideal for immediate agglutination should the other factors combine to create a favorable situation. The fourth factor consists of changes in the character and integrity of the vessel wall. Such changes can be found in the rough intima of the atherosclerotic artery or the torn intima of an injured vein. No one factor plays a predominant role, but the interaction of these four factors can be pointed to as the basis of intravascular clotting.

Thus in thrombophlebitis the early pathologic changes consist of obstruction of a vein by a thrombus with accretion of thrombus to fill other parts of the vein. At any time during this process of clot development a fragment may be dislodged and pass to the lungs causing serious sequelae.

Within a few hours of the onset of clot formation there begins a process of organization by which the clot becomes fixed to the vein wall and fibroblastic reconversion takes place. Ultimately there is recanalization of the vein as organization of the thrombus becomes complete. However these new channels when formed in the legs are unsatisfactory channels for they are devoid of valves to prevent reflux of blood in the venous system.

Venograms demonstrate very well the poor venous channels which form after thrombosis has occurred. These inadequate veins are responsible for the changes of stasis which occur after thrombophlebitis has subsided.

The symptoms of acute thrombosis are often not apparent so that pulmonary embolism may occur without obvious warning. In the greatest number of patients there will appear early signs when thrombosis has begun. Pain and tenderness in the popliteal space or the calf of the leg is present in almost all cases. Movement of the part intensifies the pain. Homan's sign (pain in the calf on dorsiflexion of the foot) is a late and unreliable sign. By watching carefully for any sign of pain or tenderness in the calf veins one can diagnose thrombophlebitis in its early stages and gain maximum benefit by early treatment.

Edema is present, but mild in the early stages, so that it is apparent only when careful observation and measurement is carried out. When edema is obvious the disease is well advanced.

Duskiness of the part distal to the clot appears early and is valuable when the color of the two limbs is compared. Dependency will increase the cyanosis on the involved side.

Three small branch veins run across the tibia just below the tuberosity of the tibia and empty into the lesser saphenous vein. Dilatation of these veins may be the first and only sign of thrombosis of the popliteal vein. However, this again is a late sign and the diagnosis should be made before it appears.

The temperature is usually slightly elevated, the pulse is increased, the blood pressure tends to

---

Read before the annual meeting of the Minnesota State Medical Association, Minneapolis, Minnesota, May 27, 1952.

be low. Pulmonary embolism may be the first sign of thrombophlebitis and in the absence of any other source is a sign diagnostic of thrombosis.

The sequelae of thrombophlebitis fall into two groups, the early and the late effects. The most important early effect is pulmonary embolism. This occurs in about 1 per cent of all surgical cases (Jorpes,[4] Barker,[2] et al). Early mobilization reduced this figure to 0.6 per cent. Zilliacus[10] points out that the frequency of pulmonary embolism in cases of postoperative thrombosis is 50 to 60 per cent and that the mortality of postoperative thromboembolism is 20 per cent. Active treatment has markedly reduced this mortality. Smith and Mulligan[7] have reported that prior to the use of anticoagulant medication the incidence of thromboembolism in women patients undergoing surgery was 1:90 and the incidence of fatal emboli was 1:484. In 2,353 patients treated with dicoumarol the incidence of thromboembolism was 1:138 and the incidence of fatal embolism 1:2353.

The late sequelae consist of the changes of stasis, the so-called post-phlebitic syndrome. As stated above the effects of stasis arise from the fact that thrombosis and recanalization has destroyed the valves of the veins. Reversal of flow and stagnation of poorly oxygenated blood results in pigmentation of the skin, ulceration, dermatitis, edema, varicose veins and pain in the legs. Few conditions are as chronically disabling and as refactory to treatment as the post-phlebitic leg. For this reason alone it is of utmost importance to stop the extension of the thrombosis and treat it actively while it is still confined to small veins. Our policy is to begin treatment, and by this I mean complete treatment, at the mere suspicion of thrombophlebitis.

The treatment of thrombophlebitis has undergone many changes during the past decade without having reached a point where there is complete agreement among the various workers. For instance, Pratt[7] and his group advocate vein ligation as early treatment, Barker[2] and his group use dicoumarol, Jorpes[4] prefers heparin.

Rather than argue the merits of the various methods of treatment let us consider what is practical for most physicians. Omitting vein ligation from the discussion for the time being let us consider the anticoagulants. Heparin and dicoumarol are the only practical anticoagulants available at the present time. Heparin is expensive and must be given intravenously; dicoumarol is inexpensive and may be given by mouth. Heparin, as we use it, needs no laboratory control; dicoumarol can be used only when skilled laboratory help is available to do daily prothrombin determinations. In most instances where laboratory facilities are meager heparin has a great advantage over dicoumarol.

How is heparin used? Heparin is used intravenously. It may be used by the intermittent or the continuous technique, but the intermittent technique is safer and simpler.

The intermittent technique implies repeated administration at specific intervals such as every four hours or four times a day. In general we use the Swedish technique of giving the heparin at 8 a.m., 12 noon, 4 p.m. and 8 p.m. This is given in doses of 75 mg., 50 mg., 50 mg. and 75 mg. Almost without exception we have found that this regimen allows for relief of pain and beginning subsidence of symptoms within twelve to eighteen hours. This technique has proved to be quite satisfactory although the objection which may be raised is that the anticoagulant effect lasts only four hours, yet there is a long gap at night when no effect of heparin is evident. This is a valid criticism; however it has been found by employing this technique in many thousands of cases that this period does not impair the efficacy of the treatment.

To give heparin by continuous intravenous drip requires almost constant attention and even then is apt to be unreliable for simple change of position of the patient's arm can change the rate of flow enough so that in a short time the clotting time may reach infinity and real danger from bleeding presents itself.

Any bleeding encountered may be controlled by stopping the heparin and administering 5 to 10 cc. of 1 per cent protamine sulfate intravenously.

With the continuous technique the program worked out by Murray and Best[6] seems the most satisfactory. Ten mg. of heparin per 100 cc. saline (or glucose) is given intravenously at the rate of about twenty-five drops a minute. Lee-White clotting times are done every two or three hours making an effort to adjust the rate of flow so that the clotting time runs between fifteen and thirty minutes. The normal clotting time by the Lee-White method is five to eight minutes. Because the technique is cumbersome and time consuming we rarely use it, but prefer the Swedish technique.

TABLE I.

Prothrombin Per Cent	Time Seconds	Dicoumarol Dose mg.
20	30	100-200
15-20	30-35	50-100
10-15	35-40	25-50
10	40	omit drug 24 hrs.

Repository heparin—i.e., heparin in Pitken's menstruum, depoheparin, et cetera are not used in our hands for we have found that the absorption rate varies so much from person to person as to make the effectiveness quite unpredictable. Despite claims made to the contrary we have found that local reactions are numerous and results are not uniform; therefore we do not use repository heparin.

Dicoumarol therapy must be carried out in an entirely different manner. First of all the effect of dicoumarol is not manifest for twenty-four to forty-eight hours after administration. The drug is given by mouth but careful laboratory control must be effected daily. The patients prothrombin time is determined before administering any dicoumarol and if it is normal, 300 mg. of the drug is given. The following day a determination of the prothrombin time is again done, the dosage of dicoumarol being dictated by the plan outlined in Table I.

This dosage schedule is followed daily while the patient receives the drug.

During the first twenty-four to forty-eight hours of dicoumarol therapy there is no anticoagulant activity; therefore, to carry the patient over this period heparin should be used.

It has been our experience that dicoumarol is not as reliable as heparin in clearing up the signs and symptoms of thrombophlebitis. Extension of thrombophlebitis or pulmonary embolism has been noted with the patient's prothrombin time within therapeutic range. Similarly Wright has reported a number of cases of fatal bleeding when prothrombin levels were within therapeutic range.

Vein ligation has been advocated by Allen,[1] Pratt[7] and others. This consists of ligation of the common femoral vein and aspiration of any clots which may be present. We do not use this technique for it increases the existing stasis in the distal venous bed and contributes to extension of the thrombotic obstruction of the veins. Furthermore it does not afford adequate protection against pulmonary embolism for a large bed of veins including the iliac and pelvic veins remain from which emboli may arise. If there is indication for vein ligation we prefer to ligate the vena cava for this affords complete protection against embolism arising from the pelvic or leg veins. Our indications for vena cava ligation are (1) pulmonary embolism in a patient who for one reason or another cannot be treated with anticoagulants; (2) anticipated surgery in a patient with recent or recurrent thrombophlebitis, and (3) septic pelvic thrombophlebitis. The sequelae from vena cava ligation are few if the patient is treated with anticoagulants in the postoperative period.

TABLE II.

8 a.m.	75 mg.	or	100 mg.
12 m	50 mg.		75 mg.
4 p.m.	50 mg		75 mg.
8 p.m.	75 mg.		100 mg.

Heparin and/or dicoumarol may be used prophylactically in surgical cases. Such treatment has been found to markedly reduce the incidence of thrombosis and of pulmonary embolism. The method of treatment is similar and the results can be found in the work of Barker,[2] Jorpes,[4] Bauer[3] and others.

The social aspects of the application of anticoagulant therapy in thrombosis point up the importance and the economy of early vigorous treatment. About 0.6 per cent of all patients in surgical clinics suffer from thrombosis in the deep veins of the leg or from pulmonary embolism. The length of stay in the hospital used to be prolonged by six to eight weeks if thromboembolic complication occurred. Now with active treatment with heparin the hospital stay is rarely more than ten days and frequently is not prolonged over the normal hospital stay. With the cost of a hospital bed running from ten to twenty dollars a day, it is a real economy to use heparin at the cost of fourteen dollars a day to reduce the hospital stay by a fifth or a sixth. Furthermore in a series of untreated cases of thrombophlebitis originating in the calf 80 per cent spread to the deep veins of the thigh, while in a similar group treated with heparin 80 per cent of the cases remained limited to the calf leaving a normal leg for the future (Jorpes).[4]

Thus to recapitulate our treatment we examine patients daily for evidence of thrombosis and begin treatment upon suspicion of thrombosis. Heparin is given in the doses shown in Table II.

The legs are elevated and hot packs are applied from the toes to the groin and are kept wrapped with hot packs continuously until symptoms subside.

The patient is not allowed out of bed until the tenderness begins to subside; then the legs are wrapped in ace bandages and the patient is ambulated. After the patient has been symptom-free for three days the dose of heparin is decreased to 50 mg. three times a day for two days, then 50 mg. a day until discharge from the hospital.

Patients are instructed to continue wearing elastic bandage support until all swelling has subsided. This may mean three months, six months, six years or the rest of their life, however it is very important to emphasize the fact that they may have to wear the bandages a long time. They should not remove the elastic support until the physician tells them to do so. The bandage is wrapped from the toes to the knees, being applied upon arising in the morning and being removed before retiring in the evening. When the patient sits down in a chair the legs should, if possible, be elevated. It is preferred that the patient lie down with the legs elevated above the level of the heart any time during the day that he can as long as any swelling persists.

Such treatment will diminish the frequency of late varicosities, ulcer, stasic dermatitis, edema and painful leg.

Summary

1. Early, vigorous treatment of thrombophlebitis reduces complications and protects the patient against late sequelae.
2. Intermittent intravenous administration of heparin is the most practical method of anticoagulant administration for the majority of physicians.

GENOCIDE

While the nations of the world paid tribute to U.N.'s seventh anniversary, another voice was heard calling on all peoples to renew their faith in the dignity and worth of the human being. Paul Martin, Vice-Chairman of the Canadian Delegation to the General Assembly, recalled a resolution of a prior Assembly calling on all nations to make the mass killing of human beings for racial or religious reasons a crime punishable under international law. "Man's destruction of man for reasons of wild prejudice and unthinking bigotry must be checked once and for all, and I know of no better starting point than the immediate ratification of the Genocide Convention," said Mr. Martin.

Mr. Martin then reminded the world that one billion people now agree that the crime of genocide must be wiped off the face of the earth. Forty countries have ratified the United Nations Convention on the Prevention and Punishment of the Crime of Genocide, but they are not enough, said the Canadian delegate—"they must be joined by the other 20 until all sixty U.N. Member Countries are united. . . .

"On humanitarian grounds, mass killing must be stopped internationally lest it destroy the nations themselves. . . . In this present century alone, with only fifty-two years elapsed, 20,000,000 people have already been put to their death through the use of genocide. We must see that the next forty-eight years remain spotlessly clean."—*U.N. Reporter,* November, 1952.

PHYSICAL MEDICINE IN GENERAL PRACTICE

MILAND E. KNAPP, M.D.
Minneapolis, Minnesota

PHYSICAL Medicine may be defined as that branch of medical science concerned with the use of physical measures in the diagnosis and treatment of disease or injury. As stated by the Council on Physical Medicine of the American Medical Association, this includes the employment of the physical, chemical, and other properties of heat, light, water, electricity, massage, manipulation, exercise, climate, and mechanical devices. Since World War II this field has been expanding rapidly to meet the needs of an ever widening group of patients who need more than the conventional treatment available by the usual methods of medicine and surgery. The emphasis is being shifted from the consideration of only the localized area requiring definitive treatment to a more careful consideration of the requirements of the patient as a whole. For example, in the case of an amputation instead of considering only the type of amputation to be performed, the healing of the wound, and the physical shock to the patient, it is now the duty of the physician or surgeon to consider carefully the necessity or usefulness of a prosthesis, the type of prosthesis to be employed, the strengthening and training of uninjured portions of the body to substitute for functions that would have been performed by the injured or amputated part, to consider the psychological effects of loss of a portion of the body, and to help in planning for the re-training of the individual, if necessary, so that he may be able to earn a living and return to the highest possible level of usefulness in society of which he is capable. In this concept of planning for the total care of the patient, the role of the general practitioner is even more important than it was under the previous concept. Since he is usually the person best acquainted with the patient, his family, his capabilities, and his problems, both physical and social, the general practitioner is usually the man most qualified to advise the patient and the workers who are contributing to the patient's rehabilitation. He sees the patient first and unless he is aware of the entire group of procedures which may be used in the patient's treatment, valuable time may be lost before these are carried out. In many instances, delay will prolong the patient's convalescence or even make maximal recovery impossible.

Physical Medicine Fields

Physical medicine is usually divided into four fields of endeavor. All of these, however, must be co-ordinated to accomplish the best results in the patient. These are:

Use of Physical Agents or Devices for Diagnosis.—Such procedures include muscle tests for the estimation of muscle strength, the use of electrical currents for diagnosis of nerve injuries and muscle function disturbances, measurement of range of motion and prevocational testing as well as the ordinary diagnostic procedures.

Physical Therapy.—This includes the use of heat, light, water, electricity, massage, and exercise in definitive treatment of the process which has caused the disability. It is used to restore the part and the patient to the best possible functional usefulness. For example, after fractures it may be necessary to restore range of motion and strength before useful function can be accomplished. This may be done by the use of such measures as the whirlpool bath followed by massage to get rid of swelling, range of motion exercises to prevent or overcome contractures, and active exercise carefully graded from motions requiring assistance to those where resistance may be employed in order to improve muscle strength so that adequate function is possible. In addition, heavy resistance exercise may be used to prepare other portions of the body for the functions needed. In those cases where crutch walking will be required, the upper extremities must be so strengthened that the patient can lift his entire body weight with the depressors of the shoulder and the triceps so that he may carry out elevation and ambulation using his hands in place of his feet.

Occupational Therapy.—Occupational therapy is used for three purposes. First, as functional treatment to increase range of motion and strength

---

Read in the Symposium on The Management of Trauma and Associated States at the annual meeting of the Minnesota State Medical Association, Minneapolis, Minnesota, May 26, 1952.

through activities which can be sustained over a long period of time without the loss of interest which occurs if monotonous repetitive exercises are given. Second, diversional occupational therapy for those patients who need psychologic treatment during long continued hospitalization or convalescence. This is done for the morale of the patient rather than for his physical condition. Third, in those patients where it may be difficult or impossible to tell what occupation he should attempt to learn after a severe disability, occupational therapy can be used as a prevocational testing medium to determine whether the patient's physical disabilities will make it impossible for him to carry on certain types of work, whether his skill and intelligence is such that the work can be done, and whether his attention span or endurance are sufficient for that particular occupation.

Rehabilitation.—This comprises a hodge-podge of rather unrelated activities directed toward restoring the patient to the highest possible social and economic level consistent with his disability. It includes such things as education, training in braille, lip reading, vocational training, and other special techniques for rehabilitation. The usefulness of a total program of rehabilitation is usually limited to the treatment of such serious disabilities as hemiplegia, paraplegia, severe poliomyelitic paralyses, amputations, cerebral palsy, post-encephalitic disturbances, multiple sclerosis, crippling disabilities following arthritis, and severe accidents. The treatment itself is successfully carried out only in especially equipped centers where trained and experienced personnel is available to solve the many individual problems which arise. In these cases the main function of the general practitioner is to recognize the need for and availability of such treatment and to see to it that his patient receives the best treatment available.

Commonly Seen Conditions

Aside from the serious disabilities, there are numerous common conditions seen in the general practitioner's office for which physical types of treatment are effective and practical and in which the treatment can usually be carried out successfully in his office or under his direction.

It would be impossible to discuss all of them because of the length of time required. However, I will list a few of the more important ones with some of the principles of treatment which I have found to be practical.

1. *Post Fracture Disability.*—If the original reduction of the fracture has been adequate and the fragments have been held in rigid apposition, the development of disability is usually due to fibrosis which follows prolonged swelling. The best treatment for this condition is given in the early stages of recovery before fibrosis has developed. This means that treatment must be started as soon as possible after the injury, immediately, if feasible, or at least within ten days to two weeks following the injury. The main object of treatment is prevention or removal of swelling. The most effective method for doing this is by active exercise. If the apparatus retaining the fracture in position can be so arranged or adjusted that active motion of neighboring joints and reasonably normal use of the extremity is possible throughout the healing period of the fracture, active exercise alone may be sufficient. If this cannot be done, the use of elevation or of heat followed by massage and active exercise may be needed to get rid of the swelling. In the later stages when the fracture is healed and fibrosis and limitation of motion have already developed, more drastic measures are needed. These will include the use of the whirlpool bath followed by massage and exercise, stretching of contractures, resistive exercise to develop strength, occupational therapy in prolonged cases, gait training, and other such procedures.

2. *Shoulder Disabilities.*—The first requirement for successful treatment of these disabilities is an accurate diagnosis of the factors causing the disability. The treatment varies greatly according to the diagnosis. Acute calcified bursitis is best treated by x-ray therapy, if it has not been present long enough for the development of contractures which limit function. Most of these patients will regain range of motion if pain is relieved. However, if the bursitis has been present for a week or two so that contractures have developed which limit motion, then x-ray therapy alone will not restore the part to normalcy. In such cases the use of hot packs with special attention to positioning the hot packs over the pectoralis major, latissimus dorsi, and teres major muscles followed by stretch to the scapulo-humeral joint may be necessary for the restoration

of normal function. In this event it is important to support the scapula so that the force of the stretch does not become exerted upon the scapulothoracic muscles instead of the scapulo-humeral muscles. This may be assisted by such simple exercises as relaxed circumduction, wall crawling, and use of the shoulder-wheel. However, it has been my experience that in those cases that have severe loss of scapulo-humeral motion the patient himself cannot carry out the exercise efficiently enough to restore motion. This same principle holds true in those patients who have limited shoulder motion from other causes such as periarthritis, fractures in the shoulder area, shoulder-hand syndrome, et cetera.

Many patients with pain in the shoulder radiating down the arm, particularly when parathesias are present in the fingers without loss of shoulder joint motion, have the source of disability in the cervical spine. It may be the result of a protruded cervical intervertebral disc or of osteoarthritic changes in the spine especially when bony spurs impinge upon the nerve roots as they pass out of the cervical foramina. The ordinary anteroposterior and lateral x-rays of the cervical spine will not show this condition. It is necessary to have oblique x-rays to demonstrate the openings of the foramina. These patients will not respond to treatment given to the shoulder. Most of them will be benefited, however, by the use of heat (I usually prefer shortwave diathermy) to the neck followed by massage for relaxation and then suspension using a Sayre head sling with a pulley suspended from the ceiling. Fifty to seventy-five pounds of pull for only thirty to sixty seconds with the patient in a sitting position repeated daily will often give relief from nagging pain which has been present for years.

3. *Osteoarthritis.*—Many patients with osteoarthritis regardless of location will obtain relief from various physical measures combining heat with massage and carefully graduated exercise. Often a program can be worked out which the patient can use at home over many years. Frequently shortwave diathermy or other more complicated procedures must be used which can be obtained only at the doctor's office. If this is the case the treatments can be given until relief is obtained and then discontinued until a new attack occurs at which time they can be resumed.

4. *Rheumatoid Arthritis.*—In rheumatoid arthritis physical measures are almost a necessity to maintain muscles, connective tissue, and joints in as functional a condition as possible until the acute disease has run its course. The use of cortisone and ACTH has made the use of such measures more effective in the chronic cases. While many practitioners have been disappointed in cortisone as a therapeutic measure in arthritis, because of its temporary nature and the fact that it cannot be continued over long periods of time without serious side effects, it is useful in relieving pain and assisting in the relaxation of muscles and fibrous tissue so that more effective physical therapy can be given to the patient which may in effect move the disease backward in its course so that function may be regained or maintained for longer periods.

5. *Coccygodynia.*—In coccygodynia, relief may be obtained even after many years of pain by the use of Thiele's technique which consists of the combination of heat with intrarectal massage, stroking from the sacrum to the pubis and stretching the tight fibrous and muscular bands which are the real cause of the pain. This has been effective in cases where pain has persisted even after removal of the coccyx.

6. *Backache.*—Of course, backache represents a widespread problem in general practice in which physical measures are useful. Again an accurate diagnosis is a prerequisite to successful therapy. It is not possible to go into an extended discussion of the differential diagnosis of backache. However, a few of the causes may be listed.

1. Protruded intervetebral disc
2. Tears of muscular attachments due to back strain
3. Fracture
4. Spondylolisthesis
5. Osteoarthritis
6. Rheumatoid arthritis
7. Marie-Strumpell spondylitis
8. Specific infectious arthritis including tuberculosis and osteomyelitis
9. Fibrositis
10. Fat herniations
11. Adiposus dolorosa
12. Senile osteoporosis
13. Post-partum osteoporosis
14. Schmorl's nodules
15. Multiple myeloma
16. Postural backache
17. Psychoneurosis

In many of these conditions, physical measures will bring relief. Even in definite disc protrusions, conservative treatment will bring relief in a great majority of the cases and certainly should be given an adequate trial before surgical removal is advised. Many of these patients suffer prolongation of pain because of muscle shortening in the back or hamstrings. This is true especially of the back muscles even after surgical removal of the disc. Hot packs or diathermy followed by careful stretching of the shortened muscles and graduated resistance exercises will often give relief and help prevent recurrence.

Tears of muscular attachments often need similar treatment especially for the relief of muscle spasm.

Fractures present the same problems in the back as elsewhere with the addition that where cord or nerve injury has occurred special rehabilitation may be advisable.

Spondylolisthesis is commonly symptomless until about age forty when the patient's muscular tone and strength has decreased. At this time heavy work or strain may produce symptoms for which an x-ray is taken which reveals spondylolisthesis. Very seldom do these patients need surgical fusion. Symptoms can usually be relieved by heat and massage and the patient can remain comfortable by readjusting his mode of living to avoid strain on his back. When the patient understands the mechanical principles involved he will usually make a good adjustment.

The arthritic conditions follow the same pattern as for the same conditions elsewhere in the body except that when fusion of the spine has become complete the patient will cease to have pain and can then live a normal life if there is no involvement of hips, shoulders or other joints.

Fibrositis requires special mention because prolonged relief requires not only heat and exercise but a special heavy friction type of massage to get rid of the fibrositic nodules. This massage is extremely painful and will aggravate the condition for two or three weeks; but if treatment is persistent, the patient will then improve and the improvement may continue for months or years.

Fat herniations and adiposus dolorosa are not usually very successfuly treated by physical measures.

Senile and post-partum osteoporosis may be relieved symptomatcially by heat and massage but the underlying cause is not removed. Testosterone and calcium or aluminum preparations have been used but I have not seen anything that will materially change the x-ray appearance. A body jacket or corset may be necessary in some extreme cases but old people do not like rigid supports and usually will not wear them. So I have found that symptomatic treatment repeated as attacks occur and specific advice on prevention of injury have been most practical. Schmorl's nodes are evidences of herniation of the nucleus pulposus into the body of the vertebra due to osteoporosis.

Multiple myeloma cannot be treated by physical measures.

Postural backache may result when mechanically inefficient backs are complicated by weakened muscles or injury. The most frequent underlying cause is exaggerated lordosis so that the center of gravity of the trunk lies anterior to the sacrum. In some cases sacralization of a lumbar vertebra or lumbarization of a sacral vertebra whether partial or complete may be a factor. In these patients postural exercise emphasizing anterior rotation of the pelvis to attempt to improve the weight bearing line plus abdominal and back strengthening exercises may be useful. They must be continued for long periods of time to be effective so it is best to teach the patient to carry them out at home.

Psychoneurosis presents the same problems in the back as elsewhere only more so. I saw one patient who had been so convinced by an osteopath that leg length inequality was the cause of her backache that she spent most of her time putting sheets of paper in her shoes and taking them out to find the exact height that would give her relief. However, physical treatment will often give the patient an excuse for getting well and thus give at least temporary improvement.

Summary

There are many other conditions in which physical medicine may bring benefit but since there is not time to enumerate them all, I will conclude by stating that the usefulness of physical methods of treatment has been established in a great variety of the minor as well as the major illnesses that the doctor in general practice is called upon to treat.

CANICOLA FEVER

Report of a Human Infection Due To Leptospira Canicola in Minnesota

ROY T. PEARSON, M.D. and WENDELL H. HALL, M.D.
Minneapolis, Minnesota

CANICOLA fever is a mild form of leptospirosis, caused by a spirochete, *Leptospira canicola.* It is an acute febrile disease, characterized by myalgia, headache and markedly injected conjunctivae. There may be meningeal, renal or hepatic involvement. The organism, *L. canicola,* cannot be differentiated morphologically from *L. icterohemorrhagiae,* the etiologic agent of Weil's disease. Unlike most leptospira, however, it has no known rodent host, being primarily a parasite of dogs.

In 1945, Green and Stavitsky[2] made a survey of leptospirosis in Minnesota. They tested 198 human sera for agglutinins for *L. icterohemorrhagiae* and found none with a significant titer. However, 15 per cent of the rats and 18 per cent of the dogs tested showed a significant agglutinin titer to *L. icterohemorrhagiae.* They were not tested for antibodies to *L. canicola.* Therefore, there is a potential reservoir for leptospiral disease in Minnesota.

In 1931 Klarenbeek and Schuffner[10] discovered in Holland a variant of *L. icterohemorrhagiae* which they called *L. canicola.* Since 1937, when Dhont first described the human disease, about 200 cases have appeared in the literature, most of them from Holland and Denmark.[8] The first case in the United States was described by Ashe in 1941.[1] Since then about twenty cases have been reported in this country.[8,9] The purpose of the present report is to present the first case of human canicola fever to be recognized in the State of Minnesota.

Case Report

C.S., Negro, thirty-seven-year-old packing house worker, was admitted to the Minneapolis Veterans Hospital on July 27, 1951 with high fever, chills, headache, malaise, severe muscular pains and sore throat of eighteen hours duration. The pain in the muscles of his left thigh was so severe that he was unable to move the leg. The admitting physician's diagnosis was poliomyelitis. The patient's temperature was 103° F., pulse 110, blood pressure 108/78. He appeared acutely ill with markedly injected conjunctivae and slight nuchal rigidity. There was marked muscular tenderness, especially in the legs.

His hemoglobin was 12.6 gm. per 100 cc., leukocyte count 12,860 with 89 per cent neutrophiles and sedimentation rate, 63 mm. in one hour. Urinalysis showed a trace of albumin. Brucella blood cultures, Kahn and sickling tests were negative; Brucella, Q fever, heterophile and cold agglutinins were all absent. Stool examinations and the chest roentgenogram were also normal. Because the clinical features suggested canicola fever, he was asked about recent contact with dogs. The patient stated that very recently his dog had developed paralysis of the hind limbs and had died, presumably of distemper. Efforts to obtain the dog's carcass were not successful. Studies for leptospirosis were then done. Guinea pigs were inoculated with the patient's urine and blood on July 31, 1951; they did not become ill and autopsy was normal six weeks later. Dark-field examination of the blood and urine was done with negative results on August 1, 1951. A spinal fluid examination was performed and was entirely normal. A muscle biopsy was obtained on July 30 and was also normal. Acute and convalescent sera were obtained for leptospiral antibodies. None of the sera contained antibodies for *L. icterohemorrhagiae.* On July 31, 1951, antibodies for *L. canicola* were absent but on August 8, and again on August 31, they were present in a titer of 1:512. Antibodies for *L. pomona* were present in a titer of 1:64 on August 8, but were absent in the other sera.

The patient remained febrile with a plateau fever of about 102° F. for six days with gradually subsiding myalgia and generalized weakness. He had an uncomplicated convalescence. At present he is working every day and has no complaints.

Comment

This case emphasizes the need for agglutination studies for leptospiral diseases whenever one sees a patient with fever together with muscle pain, meningismus, and injected conjunctivae. This is especially true if there has been contact with a sick dog. It should also be noted that the initial diagnosis was poliomyelitis. The muscle pain is frequently so severe that the patient will not move his arms or legs and a primary neurological disease may be considered. Several errors were made

in attempting to establish a laboratory diagnosis. The patient's blood should have been injected into a hamster instead of a guinea pig. The muscle biopsy was done early in the illness and should have been done after the third week. The transient low titer of antibody for *L. pomona* probably was nonspecific.

Discussion

Canicola fever is a natural and frequent illness in dogs. Meyer[5] has estimated that approximately 25 per cent of all dogs have had the disease. Approximately two-thirds of the human cases give a history of exposure to dogs. The disease is transmitted via the urine of infected dogs to humans through mucous membranes, the gastrointestinal tract or breaks in the skin. In addition to direct contact with dogs, it can also be transmitted by bathing in contaminated water.

The disease in dogs was at one time called Stuttgart or canine typhus. It produces an illness which is quite similar to distemper although there are no pulmonary manifestations. The dog has a high fever, paresis of the hind legs and gastrointestinal symptoms. As in humans, the disease has diverse symptoms and varies greatly in severity from no symptoms at all to those proving rapidly fatal. Death is apparently caused by renal involvement and uremia.[4] Only 3 per cent of the dogs have jaundice. It is three to five times as frequent in male dogs as in females. Dogs also may become infected with *L. icterohemorrhagiae;* this organism produces a more severe illness accompanied by hemorrhagic phenomena and jaundice.

The disease in humans is characterized by a sudden onset with chills and a temperature of 103° to 104° F. after an incubation period of one to three weeks. The fever is accompanied by headache, photophobia, muscle tenderness, nausea and vomiting (Table I). Signs of meningeal irritation are very common with stiffness of the neck and a positive Kernig's sign (Table II). The patients are often thought to be suffering from meningitis or poliomyelitis. Where the meningeal symptoms are slight or absent, the illness may be mistaken for severe influenza. In some cases pulmonary or cardiac findings may be prominent. The conjunctival vessels are often markedly injected. Skin eruptions, either morbilliform or scarlatiniform, are more common than in Weil's disease. Jaundice occurs in only 13 per cent of the cases, is usually mild and appears on the fourth to the sixth day. About this time renal findings such as albuminuria and microscopic hematuria also are found (Table III). Some case reports stress oliguria and there may be a rise in the blood urea nitrogen. The extent of kidney damage varies widely; in mild cases there may be only transient albuminuria. Gastrointestinal symptoms such as nausea, vomiting and diarrhea occur in over half of the cases and may be quite prominent. One frequently observes mental symptoms such as irritability, insomnia and anxiety, probably the result of encephalitis.

An increased sedimentation rate has been reported in every case. A neutrophilic leukocytosis is frequent but the leukocyte count may be within normal limits. Although the spinal fluid may be normal, there is often an elevation of the leukocyte count, usually to 12 to 200 per high power field. These cells are usually lymphocytes although a high percentage of polymorphonuclears may be found early in the disease. In contrast to bacterial meningitis, the spinal fluid sugar is normal although the spinal fluid protein is usually elevated.

All victims have fever, two-thirds having a temperature over 103° F. The type of fever curve varies and the patients are febrile for about one week. In about one-half of the cases the patient may have a relapse with return of symptoms at the end of the second week. Rarely several relapses occur. Convalescence is usually prolonged, with complaints of weakness and fatigue. There may be some residual muscle tenderness.

Complications occur in about 15 per cent of the cases and are usually mild and transient. Alopecia, which is frequently seen in the dog, occurs occasionally in human beings. Eye complications are common with photophobia and blurring of vision during the acute illness. Later diplopia, iridocyclitis, vitreous opacities, optic neuritis and retrobulbar neuritis may occur.

Iridocyclitis has been mentioned as a frequent complication and it is recommended by many ophthalmologists that patients with idiopathic iridocyclitis should have tests for leptospiral agglutinins. Neurological complications such as subarachnoid hemorrhage and brachial and sciatic neuritis are seen occasionally.

Fortunately, canicola fever is usually a benign illness and death is rare, only three fatal cases having been reported. It is difficult to ascertain the cause of death in these cases. In the two cases studied at autopsy, the impression of the authors was that the patients died in uremia with acute renal insufficiency due to tubular damage.[13]

Although Ashe[1] feels that a clinical diagnosis can be suspected from the symptoms, physical findings and a history of exposure to dogs, a definite diagnosis can only be established by laboratory means. During the first few days of the illness, the "septicemic phase," the diagnosis can occasionally be made by injection of blood into hamsters.[12] Though susceptible to *L. icterohemorrhagiae,* guinea pigs are resistant to *L. canicola* and should not be used. After the first ten days the organisms may be found in the patient's urine. Dark-field examination of the blood has also been used but is of little value. Some experienced observers have been able to find leptospira by dark-field examinations of the urine after the tenth day. Blood and urine cultures are not used routinely because growth is frequently delayed for several weeks. The best diagnostic test is the agglutination-lysis test of Schuffner and Mochtar.[10] The disadvantage of this test is that the diagnostic titers do not appear until the tenth to fourteenth day. A diagnostic titer is 1:300 or above. Cross agglutination with other leptospiral antigens may occur and not infrequently there is some elevation of agglutinins to *L. icterohemorrhagiae* and *L. pomona.**

The most common mistake has been to confuse canicola fever with one of the following diseases: Meningococcal meningitis, influenza, typhoid, poliomyelitis, serous meningitis, infectious hepatitis, acute gastroenteritis, infectious mononucleosis, trichinosis and carbon tetrachloride poisoning. Occasionally the severe muscle pain has led to a diagnosis of a surgical abdomen and two cases have been operated on mistakenly for appendicitis and gallbladder disease. There is a clinical aphorism that in a patient with jaundice and renal disease one should consider the possibility of carbon tetrachloride poisoning and leptospirosis.

Sheldon[11] described changes seen in skeletal muscle in Weil's disease and advocated muscle biopsy as a diagnostic procedure. The early finding is muscular necrosis with a very slight amount of inflammation. The diagnostic change occurs later in the healing stage with a striking amount of sarcolemmal nuclear proliferation. It is not advisable to take the biopsy until at least the tenth day of illness and preferably after three to four weeks. This test remains positive for several months. The best way to make the diagnosis early in the disease is to have the dog examined by a veterinarian if there is a history of exposure. The leptospira are easily found in the kidneys.[13] An early diagnosis may also be made by inoculating the patient's blood into a hamster or in Schuffner's culture media.[12]

Because the disease is self-limited and relatively benign, it is difficult to determine the value of various forms of therapy. Antibiotics have been used both experimentally and clinically. Penicillin has been used most often and has been found to be leptospirostatic *in vitro.* Some authors are quite enthusiastic while others claim it is of little value in leptospirosis. There appears to be a varying response; it is more effective when given early. Penicillin does not prevent relapses nor does it eliminate leptospiuria. Because of this, some authors recommend the concomitant use of streptomycin in eradicating the leptospira from the urine. Aureomycin and terramycin have also been reported to be beneficial.[3] The majority at this time seem to favor the use of aureomycin or terramycin as early as possible in the disease, although there is insufficient evidence to prove their value. All dogs suspected of having the illness should be isolated and treated until there is no further evidence of leptospiuria. Penicillin has been said to be of value in the dog.[12]

---

*In all cases where the clinician suspects leptospirosis, both acute and convalescent sera should be sent to the laboratories of the Minnesota State Board of Health which will forward the sera to the Communicable Disease Center of the U. S. Public Health Service at Chamblee, Georgia.

Summary

A case of human canicola fever has been reported, the first to be recognized in Minnesota. The diagnosis of canicola fever should be included in the differential diagnosis of any unexplained febrile illness. Conjunctivitis and meningitis are common and jaundice is rare in the disease. Inquiry into history of exposure to dogs and repeated serum agglutination studies are most helpful. Because of the vast canine reservoir of the disease, the human disease may not be rare. Knowledge of the clinical features and available diagnostic tests should lead to the recognition of many more cases.

RECKLESS DRIVERS—RECKLESS JURIES

We observe with horror and discouragement the loss of life of the flower of our youth in modern warfare. In September, 1951, the millionth American military man died in the service of his country since 1775. The millionth motor vehicle victim died in December, 1951, and the count only started in 1900!

Every day we read in the newspapers of traffic accidents. Only the spectacular rate headlines. The average reader shows little interest unless he knows or is related to the victims.

Those in the automobile insurance business have the opportunity to study claim reports daily. We know the causes of accidents. The following are typical:

Speeding, the cause of over half of all motor vehicle accidents; drunken driving; driver had "only one drink"; failure to stop on signal; brakes failed to hold; failure to stop at stop sign; failure to yield right of way; driving over center line; bad judgment in trying to pass the car ahead; insured's young son learning to drive; showing off, racing and stunt driving; driver had defective vision; driver had epileptic fit; driving on wrong side of road; elderly driver, hard of hearing—became confused.

This list embraces over 90 per cent of all of the reasons why automobile accidents happen. All of them are preventable or involve drivers who should not be permitted behind the wheel of an automobile.

Insurance companies have lost many millions of dollars over the past several years in underwriting automobile business, especially those forms involving liability for bodily injury and property damage. Premiums have been increased in almost every state in the Union. It is now evident that because of the increased amount of money insurance companies have had to pay out or set aside as reserves for losses, a further advance in the premium level will eventually be required. Accident frequency is increasing, more people are being killed and injured, and settlement values and court verdicts have reached an all-time high.—*Fireman's Fund Record,* August, 1952.

MELANIN SPOTS OF THE LIPS, ORAL MUCOSA AND DIGITS ASSOCIATED WITH INTESTINAL POLYPOSIS

Report of a Case

LLOYD F. SHERMAN, M.D., and ROBERT J. TENNER, M.D.
Minneapolis, Minnesota

RENEWED interest in the syndrome of melanin pigmentation of the lips, oral mucosa and digits associated with intestinal polyposis has been manifest in the medical literature since 1949. It is now well established that the presence of melanotic spots in these locations indicates further investigation of the patient to rule out intestinal polyposis.

Sir Jonathan Hutchinson,[5] in 1896, was the first to report the distinct melanin pigmentation that is characteristic of this syndrome, in identical twins. There was no mention made of the presence or absence of pigmented areas of the hands. Hutchinson was not aware of the presence of any intestinal trouble in either twin. However, Weber,[12] in 1919, reported a follow-up study on these cases and stated that one twin died at the age of twenty from intestinal intussuception, and the second twin died at the age of fifty-two of cancer of the breast.

Dermatologists have been aware of the peculiar melanotic pigmentation of the lips, oral mucosa, face and digits for some time prior to the association of this syndrome with intestinal polyposis. In 1921, Peutz,[9] of the Hague, described a family in which several members had pigmented spots of the mouth, hands, and feet with intestinal polyposis. This report represents the first reference in the medical literature to the syndrome by a specific title and the earliest to stress the association of pigmentation with intestinal polyposis.

Van Dijk and Oudendal,[11] in 1925, reported the incidence of a brother and sister who underwent surgery because of repeated episodes of intestinal colic. Intussusception of the ileum secondary to adenomas of the small bowel was found. Both brother and sister had pigmentation of the lips and buccal mucosa.

Foster,[3] in 1944, published the report of a father and daughter who suffered from single small bowel polyps complicated by intussusception. They both showed the characteristic circumoral pigmentation. The father's brother, who also had similar lip and facial pigmentation, was subject to attacks of abdominal pain and bloody stools. He was found to have an inoperable carcinoma of the stomach. This man's son also had attacks of abdominal pain as well as unusual pigmentation of the oral mucous membrane and lips.

Touraine and Couder[10] reported another case in 1945. Jeghers[6] is primarily responsible for calling attention in the American medical literature to this hitherto unappreciated syndrome. In 1944 he briefly reviewed the literature and mentioned two proven cases. Recent interest in this syndrome was renewed following a comprehensive review of the literature and case reports of ten patients by Jeghers, McKusick and Katz[7] in 1949. Since then, four additional cases[1,7] have been reported in the literature to give a total of twenty-five proven, five probable, and four possible diagnoses of this unusual syndrome.

Pigmentation

The pigmentation in this syndrome is most striking on the lips and buccal mucosa, presenting as round, oval, or irregular patches of brown or occasionally almost black pigment. The patches on the lips and buccal mucosa vary in size from 1 to 5 mm. or slightly larger in diameter. Patches in the mouth are most prominent on the buccal mucosa, occasionally on the gums, or hard palate, and more rarely on the tongue. Pigmentation of the lips is more noticeable on the dental than on the outer aspect and more numerous on the lower lip. Pigmented spots may be found on the upper lip and more rarely involving the skin about the mouth and on the fingers and toes. Histologic study of a pigmented lesion reveals a collection of melanin to be distributed in vertical bands through the epidermis. The salient factor is that the labial and buccal mucosal pigmentation must be present in order to diagnose this syndrome; digital and facial pigmentation are merely complementary if found. The pigmentation must not be confused with ephelides (ordinary freckles) which do not occur on the mucous membrane of the oral cavity.

Inaugural thesis presented before the Minneapolis Academy of Medicine, April, 1952, and before the annual meeting of the Southern Minnesota Medical Association, Mankato, Minnesota, September 8, 1952.

Figure 1 shows the characteristic pigmentation. Jeghers[6] calls the buccal mucosal pigmentation the sine qua non of the syndrome.

The sex distribution in the reported cases is equally divided between male and female. Most of the patients were dark complexioned. In each patient where data were available, pigmentation had been present from early in childhood to the age of twenty or more with little or no tendency to fade prior to that time. Peutz[9] observed some fading of the facial pigmentation after the age of twenty-five, but the oral pigmentation persisted.

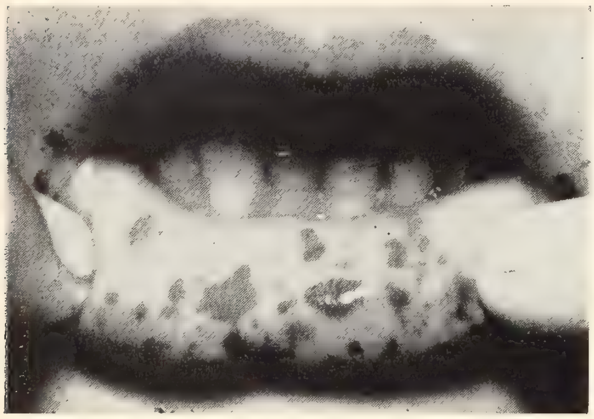

Fig. 1. Characteristic melanin pigmentation of the lips and buccal mucosa, as demonstrated by case reported.

Intestinal Polyposis

The other phase of the syndrome consists of intestinal polyposis. In the reported cases the polyps were distributed throughout the entire intestinal tract with their most striking clinical manifestations in the small intestine. Polyposis was also present in the stomach, colon and rectum in a number of the patients; however, the jejunum led the other intestinal segments by far, as the most frequent location for polyps.

The intestinal lesions are the usual adenomatous polyps. The well-known tendency for multiple polyposis of the colon to develop malignancy holds to some degree for the small bowel polyps in cases of this syndrome. The incidence of cancer here is not so great as that in the hereditary large bowel polyposis but is distinctive enough, nevertheless. Small bowel polyps developed malignancy in six diagnosed patients of the twenty-five case reports in the literature.

Four of Peutz's[9] patients had nasal polyposis and one had polyposis of the bladder. Jeghers[7] and associates reported one patient with the classical pigmentation in which they were unable to establish intestinal polyposis after thorough investigation. Actual polyps present are shown in Figure 2.

Heredity

It is well established that multiple polyposis of the large intestine is frequently hereditary. Dukes,[2] in an exhaustive review of the subject, concludes that "it is an inheritable disease which is transmitted by both males and females, that both males and females suffer from the disease, and that inheritance can be traced through several generations." Gates[4] reviewed the genetic aspects of polyposis of the large intestine and was able to discover the pedigree of a total of forty families in the literature. He concluded that the condition is a simple Mendelian dominant with an occasional skip in some families.

Multiple polyposis of the small intestine or of the entire gastrointestinal tract, as seen in the syndrome under discussion, appears to be an entity distinct from the more common colonic polyposis, yet available data indicates that it follows a similar genetic pattern; that is, the syndrome appears to be inherited as a simple Mendelian dominant. Both males and females carry the factor, and both are affected about equally. Jeghers[7] suggests that variability may at times be present in the hereditary pattern of this syndrome, although no definite evidence of it has been established to date. It might be subsequently demonstrated that in the same family some members show only polyposis and some only spots.

Case Report

The patient, a twelve-year-old white boy, was referred to our office by Dr. O. L. N. Nelson on June 25, 1951. This patient previously had been studied and reported as one of the small group with this unusual syndrome by Drs. Perry and Zuska[8] at the Naval Medical Center, Bethesda, Maryland. A polyp of the descending colon was resected at that institution in 1949. He was subsequently advised to have periodic gastrointestinal x-ray studies and sigmoidoscopic examinations.

Past History.—This patient's past history is extremely interesting. His illness had its clinical onset when, between the ages of nine and twelve months, he had his first episode of subnormal temperature, pallor, listlessness, abdominal distress, and repeated vomiting. Medical advice was sought, but no therapy was instituted because the symptoms subsided in a few days. When the child was between nine months and six years of age he suffered five or six similar episodes, each characterized by sudden onset. During this entire period he was a sick, underweight child with many feeding problems; in particular, the morning meal was vomited after eating. Many physicians were consulted and the consensus was that the mother wasn't feeding the child correctly.

In 1944, at the age of six years, another episode of high intestinal obstruction occurred. He was then hospitalized for fifteen days. During this period an exploratory laparotomy was performed and a double intussusception of the proximal jejunum was found. Two large polyps of the jejunum were responsible for the intussusception. A segmental resection with end-to-end anastomosis was performed. The postoperative course was uneventful and the patient has had no further signs of intestinal obstruction since the operation. Histologically, both polyps were reported as benign.

One year later several polyps protruding from the boy's anus were excised. The patient's family was advised that he should have yearly barium enema studies along with proctoscopic examinations. When he was between the ages of seven and eight years, five or six new rectal polyps were discovered and excised. Again, at the age of eight another rectal polyp was fulgurated.

The patient had no more difficulty until July, 1949, when a large polyp of the descending colon was discovered by roentgenogram. He was then hospitalized at the Naval Medical Center at Bethesda, Maryland, where the syndrome of melanin spots of the lips, oral mucosa, and digits was first associated with his intestinal polyposis and labeled as such. His pigmentation, however, had been present since birth. A colotomy was performed and the polyp excised. No other abnormality was noted on abdominal exploration and the polyp was reported as a benign adenomatous type.

Family History.—Neither maternal nor paternal grandparents showed any signs of melanin spots or intestinal polyposis. Two are living and well. One died of pulmonary tuberculosis and the other of uremia. No other relatives could be implicated with this syndrome and both father and mother are living and well. There is one sibling, a brother, aged sixteen years. Careful examination revealed two questionable melanin spots of the dorsum of his left hand. However, proctoscopic, upper gastrointestinal x-rays with stasis studies, and a double contrast barium enema were all negative. This patient studied apparently represents a sporadic incidence of this syndrome.

Follow-up studies were non-revealing until June of 1951. At this time double contrast barium enema studies revealed another polyp of the descending colon. Proctosigmoidoscopic examination revealed a small (2 x 2 mm.) sessile adenoma of the right rectal wall at 7 cm. This was fulgurated. No other abnormality was noted as far as 25 cm.

The patient was admitted to St. Barnabas Hospital on June 29, 1951. At this time he was asymptomatic and he appeared to be a normal, well-developed and well-nourished twelve-year-old white male, weighing 120 pounds. The mucous membrane of the lower lip was diffusely mottled with dark greyish black pigment deposited in patches of varying size. These lesions were not elevated. On the skin about the lips there were a lesser number of similar lesions, some slightly elevated, and in addition a few pigmented areas were present on the oral mucosa. The hands and feet appeared normal. The temperature was 98° F.; the blood pressure 112/70 mm. Hg. and the pulse 76.

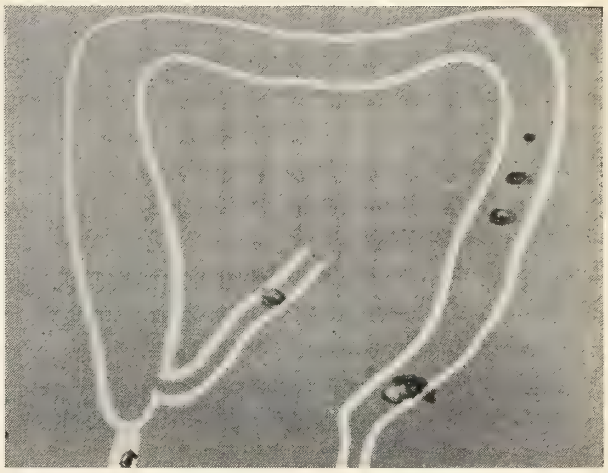

Fig. 2. Sketch of the terminal ileum, appendix and colon with actual polyps in their approximate locations.

The laboratory reported a red blood count of 4,320,000, hemoglobin, 14.4 gm. and white blood count, 8,100; differential and urinalysis were normal.

Preoperatively he received intestinal preparation with a suspension of sulfathaladine for one week and terramycin for two days. On July 2, 1951, a laparotomy was performed. Palpation of the descending colon readily identified the polyp found at x-ray. It was deemed advisable to examine the remaining gastrointestinal tract and so the stomach and entire intestinal tract were carefully threaded through palpating hands several times. The stomach and duodenum were normal. Six inches distal to the ligament of Treitz evidence of a previous resection and anastomosis was noted. The remaining small bowel was negative, except for the distal ileum. In this segment of bowel, approximately four feet proximal to the ileocecal valve, a polyp was palpated. An ileotomy was performed and a pedunculated polyp 2 cm. in diameter was excised with a cuff of adjacent mucous membrane. The bowel was incised longitudinally and closed transversely.

The colon was next carefully palpated several times. In the region of the distal descending colon the polyp which was discovered on x-ray was easily palpated. A longitudinal colotomy was made over the midpoint of excursion of the palpable polyp. A pedunculated polyp 3 cm. in diameter was visualized and excised over a clamp with an adjacent cuff of the mucous membrane. A sterile sigmoidoscope was next introduced via the colotomy incision to visualize the distal descending and entire sigmoid colon, and no abnormality was noted. The colon was then visualized to the splenic flexure. Three other pedunculated adenomas varying in size from 0.5 to 1.0 cm. were visualized scattered over the descending colon. These were excised at their origin with the fulgurating snare and the bases were then fulgurated as were two smaller match-head-sized adenomas in the same area. The colotomy was closed longitudinally.

Before closing the abdomen, the appendix was inspected and since several fecoliths could be palpated it was deemed advisable to remove the appendix, prophylactically. On longitudinal section two sessile 3 x 3 mm. adenomas were noted in its midportion. All polyps were reported as benign adenomatous polyps. The convalescence was uneventful and the patient was discharged from the hospital on the eighth postoperative day.

Follow up x-ray studies on January 3, 1952, reported no demonstrable involvement of the colon or upper gastrointestinal tract. Proctosigmoidoscopic examination, however, revealed a small sessile adenoma of the rectum at 8 cm. This was destroyed by fulguration.

Conclusions

A brief review of the literature and a follow-up case report of a patient with the unusual syndrome of melanin pigmentation of the lips, oral mucosa and digits with associated intestinal polyposis is presented. This case is probably a sporadic instance of a syndrome which is usually clearly hereditary and transmitted as a simple Mendelian dominant.

When pigmentation of the type described is seen, small and large bowel polyps should be searched for diligently by roentgen studies of the gastrointestinal tract and by sigmoidoscopic examination.

Careful follow-up studies are imperative if we hope to avert the malignant tendency that may occur in many of these cases, as well as to detect new polyps as they arise.

HILL-BURTON HOSPITAL CONSTRUCTION PROGRAM SLOWING DOWN

During six years, the Hill-Burton Hospital Construction program has approved 1,877 projects for federal grants totaling just over *half a billion dollars.* Of the 90,645 beds, about 44 per cent already are in operation, the remainder under construction or in planning stages.

The latest progress report, as of September 30, also shows that inflation and budget restrictions are rapidly slowing down the program. In fiscal 1950 a total of 537 projects were completed or on the books; the total for the current fiscal year is not expected to exceed 150.

For fiscal 1948, and 1949, the first full years of operation, appropriations were $75 million annually. In 1950, Congress increased the maximum limit to $150 million, and voted the full amount. Appropriations for the subsequent three years were $85 million, $82.5 million and $75 million. Meanwhile, construction costs per bed increased, according to hospital authorities, about 50 per cent.

The program was designed particularly to build small hospitals and in rural areas, but from the start a high percentage of the funds has gone to relatively large institutions in urban areas. On this the analysis supplied by Division of Hospital Facilities, Public Health Service, states: "Although 57 per cent of the new projects are for facilities with fewer than fifty beds, *only 25 per cent of the federal funds . . . (go) . . . to these smaller facilities.* A little more than half of the federal money for new hospitals assists facilities with 100 or more beds. For additions or alterations, 82 per cent of federal funds is going to hospitals with 100 beds or more." With emphasis on larger, long-range jobs (nineteen medical school-connected hospitals on current list), reduced grants are not immediately reflected in the administrative workload, which is expected to continue at about its present level for several years.

Under the law, funds are allocated to states for distribution. Determination of what projects to assist is the responsibility of the state hospital authority, based on a survey of hospital facilities and willingness of local communities to make plans and raise money.—*Capitol Clinic,* November 4, 1952.

MANAGEMENT OF CUTANEOUS MALIGNANCIES

L. M. HAMMAR, M.D.
Mankato, Minnesota

IT IS unusual today to have a patient first present himself with an advanced carcinoma of the skin. Campaigns to acquaint the layman with the danger of neglecting skin lesions have been on the whole quite effective. Many of the lesions we are asked to see are now in the precancerous stage. Nevertheless we are still shocked out of any sense of complacency by the occasional patient who presents himself for the first time with a far gone cancer. Far more shocking, however, is the case of the patient who has dutifully presented himself to his physician with an early insignificant looking sore and now, because of neglect or ineffective treatment, comes in with a deep hole in his face or swollen regional lymph nodes. It is to forestall this situation that I should like to review the common cutaneous malignancies and present a plan for their management.

Premalignant conditions deserve separate consideration because they pose a difficult problem. What is a precancerous lesion? The best definition I have heard is—any sore that does not heal in three or four weeks. The most common precancerous skin lesion is senile keratosis.[2] These brownish, slightly elevated patches, often with a crusting or scaling appearance, frequently are so widespread on the skin of an elderly patient that one does not know where to start or stop in their treatment. Certainly it would be a very major undertaking to try to remove all the keratotic patches regardless of the method used; yet we know they may have serious potentialities if not treated. For this reason I treat all patches which show any sign of ulceration or recent change. Usually thorough fulguration with a high frequency spark after biopsy of suspicious areas will provide effective control. The use of x-ray in treatment of these lesions is to be discouraged unless they have been shown to be frankly malignant. Senile keratoses are not infrequently the predecessors of squamous cell carcinoma. Their usual location is on the exposed surfaces of the body, namely, face and dorsum of the hands.

Seborrheic keratoses,[3] unlike the preceding variety, occur more commonly on the trunk. They are sharply circumscribed papules or tumors, yellowish to brown in color, and usually have an oily scale. These lesions while not as dangerous as senile keratoses will sometimes break down and become carcinomatous. They are also preferably treated by excision, cautery, or fulguration and not by x-ray or radium.

Pigmented nevi or moles likewise present a problem which is difficult to answer. They may vary from a few lightly pigmented spots present since birth to wide areas of densely pigmented skin, the "bathing trunk" nevus. Black areas are also frequently found in seborrheic keratoses. In general, they are harmless, especially if congenital and not in areas exposed to irritation and if they show no evidence of growth. Moles on hands or feet are especially dangerous. Signs of malignancy are any visible growth in a previously quiescent mole, or the development of a mole in a previously normal area. Degree of pigmentation is of no significance. Should the lesion exhibit these signs of being a malignant melanoma, treatment must be on an all-out basis with wide excision of the primary and preferably a block resection of the regional lymph nodes. Fulguration and irradiation have no place in treatment of these lesions. They are almost totally radioresistant. Ineffective treatment may be worse than none by stimulating the local lesion to more active growth and production of "daughter" colonies surrounding the primary lesion.

Much the most common cutaneous malignancy at our clinic is basal cell carcinoma.[1] In its earliest form it may appear as a minute scaling or crusting area or as a pearly nodule. Later the nodule shows a small ulceration in its center and often has a typical elevated or rolled edge. Still more advanced cases become deeply excavated ulcers—the so-called rodent ulcers, which slowly but relentlessly erode through all tissues including bone, and produce the horribly dished out lesions of the facial region. Favorite site for basal cell carcinoma is the nose and adjacent area of the cheek. They may, however, occur on any part of the face and are common in the scalp. These tumors are supposed to be only locally in-

---

Read at the Annual Meeting of the Southern Minnesota Medical Association, Mankato, Minnesota, September 8, 1952.

vasive. It is not unknown, however, for metastases to be found in regional lymph nodes in cases of long standing basal cell carcinoma, and it is probable that some of these tumors assume characteristics of the squamous cell type. Still others may be of a mixed or squamo-basal type at onset. Microscopically the basal cell carcinoma is recognized by the thick cords or sheets of cells deeply staining with hematoxylin often having a columnar or cuboidal arrangement of the peripheral cells. Frequently there is infiltration of the underlying corium by lymphocytic cells. Many differing types of basal cell carcinoma have been described. Krompecher lists six. Histologically the basal cell lesions should respond well to irradiation therapy for they are composed of rather undifferentiated cells of the germinative layer. For the most part they do respond well and if the involvement is not too extensive, the cure rate should be well above 90 per cent in this type of lesion.

Squamous cell carcinoma may develop anywhere on the body's integument. It is a more malignant process than the basal cell type because it spreads through lymphatic channels as well as being locally invasive. Grossly the lesion may vary from a tiny scaling patch to a large fungating or ulcerating sore. Exposed parts of the body are sites of predilection. Microscopically the cells are more differentiated than basal cell carcinoma, are less deeply staining, and show a tendency to keratinize and form epithelial pearls. As a result of this greater degree of differentiation these lesions are somewhat more radioresistant than the basal cell variety. The site of the original lesion affects the prognosis. Those on the hands and feet have a bad reputation. Squamous cell carcinoma of the skin of the neck is readily curable but a wide zone of normal skin must be included in the treatment area because spread through the local lymph channels is greater in these lesions than in any other type.

The importance of making an accurate diagnosis cannot be overemphasized. We must know what the lesion is before it can be efficiently treated. The matter of making diagnosis boils down to one word—biopsy. The procedure is simple, quick, and innocuous. Contrary to the belief of some it does not tend to disseminate the cancer. Explain the necessity of the procedure to the patient but avoid the use of the word "cut." Say rather, "We must take a small piece of tissue for microscopic examination." Very few will refuse. With procaine infiltrated into the area excise a wedge from the actively growing edge of the lesion, not from the necrotic or crusted central portion. Include some of the normal appearing periphery. Unless bleeding is unusually active no suture is required. Inform the pathologist of the site and the character of the lesion. Repeat the biopsy if there is any question of the diagnosis.

Provided with microscopic proof that a lesion is malignant one is armed with the courage to prosecute a sufficiently wide excision or deep cauterization or to carry the irradiation to a cancerocidal dose. Without such backing one is more apt to temporize or to give the lesion ineffective or insufficient treatment.

Having established the tissue diagnosis, plan the treatment. I do not treat precancerous lesions, moles, or melanomata with any form of irradiation. Cautery, fulguration, or excision are adequate for the first two and radical excision is necessary for the latter. Irradiation is reserved for proved basal and squamous carcinomata. I do not wish to talk about technical aspects of irradiation but should like to mention a few pertinent points. There is no such thing as a "little x-ray treatment" in attacking skin malignancies. Many patients are still referred in however with such a request. Too litle or too prolonged irradiation is worse than no treatment. If given in a single exposure, 3200 roentgens to the base of the lesion is considered to be a carcinomacidal dose. Fractionation of the treatment, that is dividing it into two or more exposures, necessitates increasing the total dose. The referring physician and the patient should both be informed of the expected skin reaction from the treatment. X-rays produce damaging effects on all tissues and cells. Some cancer cells are more susceptible to the ionizing actions of the x-rays than the cells of the normal skin and have less power of recovery than normal cells. This is the sole reason for irradiation treatment of skin cancer. Sometimes this difference in susceptibility is small and as a result the treatment must be carried to a point where a rather severe damage to the bordering normal tissue is produced. An adequately treated case will develop an ugly oozing, red, raw sore in the treated area appearing two to three weeks following the treatments. If not informed of what to expect, the patient may become unduly alarmed and his local physician may tell him he has an x-ray burn. True enough he has, but it is a therapeutic burn and will usually heal smoothly in another month. Much unnecessary worry and hard feeling can be avoided by referring to the epidermite not as a burn but as an expected x-ray reaction.

Biopsy is again of paramount importance in apparent recurrent lesions. It is the only method which will tell us whether we are dealing with a persistent neoplastic ulcer or chronic irradiation necrosis. Recurrent lesions following previous inadequate irradiation give us trouble, particularly those following treatment with radium where the dose was specified only in mg. hours and where it is difficult to estimate the actual dose in gamma roentgens. It is always futile to attempt to control a recurrent case by administering a smaller dose than originally was used. The growth is undoubtedly a relatively radioresistant one and to effect a cure a considerably larger dose must be given. We see most recurrences in cases previously treated with radium. The surrounding skin is often atrophic, avascular, and scarred. These lesions respond poorly to irradiation and are probably best treated by excision and skin grafting. Unless radium is carefully placed in prescribed patterns in treating skin lesions, the gamma roentgen dosage to the tumor tissue is exceedingly non-homogeneous and parts of the tumor may not receive a cancerocidal dose. For this reason I find it more expedient to use x-irradiation in treatment of accessible skin lesions; the dosage is more homogeneous and surrounding areas can be more easily shielded. This is especially true in lesions of the eyelids. The eyelids can be effectively shielded from x-rays by leaded plastic cups placed over the cornea. There is no effective shielding, however, for the gamma rays from radium and danger of an irradiation cataract is greater if radium is employed in such lesions.

It is not to be inferred that other methods may not be used in treating cutaneous cancer. Undoubtedly an equal number of cures might be obtained if the growth is destroyed by excision or thorough cautery. Many attempts with such methods are unsucessful because of failure to include a safe margin of the normal surrounding skin. Lesions of the neck are especially prone to recur unless a wide margin of safety is allowed. I include at least 1.5 cm. margin of normal skin when treating such lesions by irradiation. Fulguration, or cauterization with high frequency spark, if not done properly is an unsafe method. One is apt to think that the spark seen under the surface has devitalized all tumor cells only to have the lesion recur later. The charred crust must be removed and successive layers fulgurated until an ample depth of tissue has been destroyed. It is difficult to anesthetize the skin completely to heat by infiltration of procaine, which is another reason the fulguration is often stopped short of the desired point.

In closing I should like to present a plan for management of cutaneous malignancies:

1. Make a diagnosis—preferably a tissue diagnosis by means of a biopsy.

2. Whatever the method of treatment selected, let it be thorough—include sufficient depth and breadth to encompass all tumor tissue.

I believe that by following these two simple rules the percentage of cures of skin malignancies can be significantly increased.

SERVICE-CONNECTED DISABILITY CARE

A report for September has just been released showing the extent of treatment in VA hospitals of service-connected disabilities. Of 102,613 veterans hospitalized by VA during that month, 35 per cent were under treatment of service-connected illness or injury. The report showed that 25 per cent were pensioners having permanent and total disabilities; 11 per cent had service-connected disabilities but were hospitalized for other conditions; 8 per cent had no service-connected disability, under treatment for tuberculosis or psychosis; 10 per cent the same as foregoing but under treatment for non-chronic conditions; remaining 11 per cent for miscellaneous conditions.

EMPHYSEMA OF THE LEG FOLLOWING PERFORATION OF THE RECTUM

Report of Case

WILLIAM C. BERNSTEIN, M.D., C. HARRY GHENT, M.D., and CHARLES E. REA, M.D.
Saint Paul, Minnesota

SERIOUS complications following perforations of the rectum have been reported by many authors. Prior to World War II these complications were accompanied by high mortality rates. A report in the Military Surgeon of 1933 stated that perforating wounds of the rectum carried a mortality rate of 45.19 per cent. With the advent of antibiotics and more radical and judicious surgical measures most of the cases of perforation of the rectum which are diagnosed within a reasonable period of time after the accident can be saved.

Peritonitis following perforation of the peritoneal cavity is without question the most common serious complication of rectal perforation. Impalement of the rectum and gunshot wounds most frequently produce this complication. Perforation into the bladder or urethra, injuries to the blood vessels, and abscesses of the perirectal spaces are among the other serious complications of this condition.

We wish at this time to present a case of massive emphysema of the entire leg which occurred following a rectal perforation and abscess of the ischiorectal fossa.

Case Report

Mrs. G. A., aged forty-nine, was admitted to Ancker Hospital on May 7, 1952. She stated that she had fallen from the top of a chair six days previously and that she had struck her perineum against the edge of the chair during the fall. She also stated that she had injured her left hip and right arm during the fall. The pain in the left hip was very severe immediately after the injury and she was taken to a private hospital. X-ray examination showed no evidence of fracture. During the subsequent four days she had severe pelvic, sacral and left hip pain. She also had pain in the lower abdomen. Her temperature during this period ran between 101 and 102° F. On the fifth day after the injury the pain in the left leg was very severe and extended down to the ankle. The temperature at that time was 102° F. There was a small amount of vaginal bleeding but rectal bleeding was not noticed. On the sixth day after the injury an x-ray of the left leg revealed collections of gas along the fascial planes from the upper thigh to the ankle. A tentative diagnosis of gas gangrene was made and the patient was transferred to the contagious ward of Ancker Hospital. The radiologist* who interpreted the x-ray plates did not feel that the case was one of gas gangrene since the gas did not infiltrate a given area in a homogeneous manner but was localized along the fascial planes.

On admission to Ancker Hospital the pelvis and left leg were again x-rayed and at this time an area of gas was seen in the pelvis in an area which seemed to be lateral to the lumen of the rectum. An increased amount of gas was seen in the thigh, popliteal space and calf. The temperature was 101.8° F. Abdominal examination revealed nothing of note. There was no tenderness, rigidity, or masses in the region. Examination of the perineum revealed marked tenderness to the left of the anus. There were no visible lacerations of the genitalia, anus or perineum. There was marked deep pelvic tenderness which prevented an extensive bimanual examination. Marked pain was elicited when the finger was inserted into the anal canal and lower rectum. Examination of the extremities revealed a brownish discoloration over the medial surface of the upper part of the left calf. Extreme tenderness was noted on the upper and medial surfaces of the calf, over the popliteal area and the lower and posterior part of the thigh. Definite crepitation could not be felt. There were no cutaneous blebs present. No mousy or other characteristic odor suggestive of gas gangrene could be detected. An x-ray examination was again made and the plates were compared with those taken previously. The amount of gas along the fascial planes of the thigh and leg was increased over the previous x-ray examination. No evidence of fracture could be made out. Laboratory studies revealed a leukocyte count of 19,300 but were normal in other respects. The remainder of the physical examination was negative.

Immediately after admission the patient was started on 50 cc. of polyvalent antitoxin in 500 cc. of 10 per cent dextrose intravenously. Therapeutic doses of penicillin and streptomycin were given. On the evening of admission it was felt that the amount of gas in the leg was increasing. The patient was taken to the operating room where five incisions were made in the left leg between the ankle and the hip releasing the gas which was under marked pressure. These wounds were packed open. Smears and cultures taken at the time of surgery revealed the presence of E. Coli.

Proctoscopic examination was performed on the day after admission to the hospital. This revealed the presence of a perforating wound of the anterior wall of the rectum about 2 cm. above the anorectal line.

---

*Dr. B. A. Hall, St. John's Hospital, St. Paul, Minnesota.

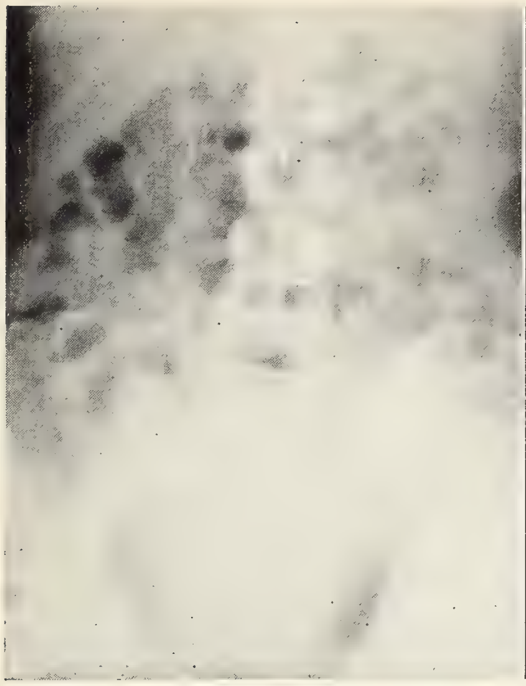

Fig. 1. Large air filled cavity lateral to mid-line of lower pelvis.

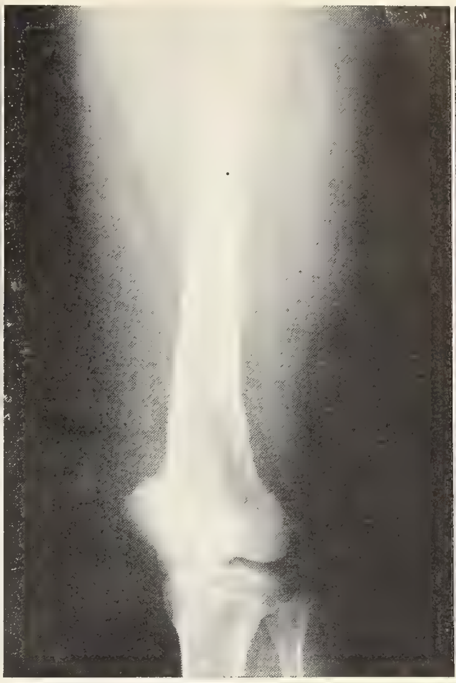

Fig. 2. Gas seen along the fascial planes of thigh.

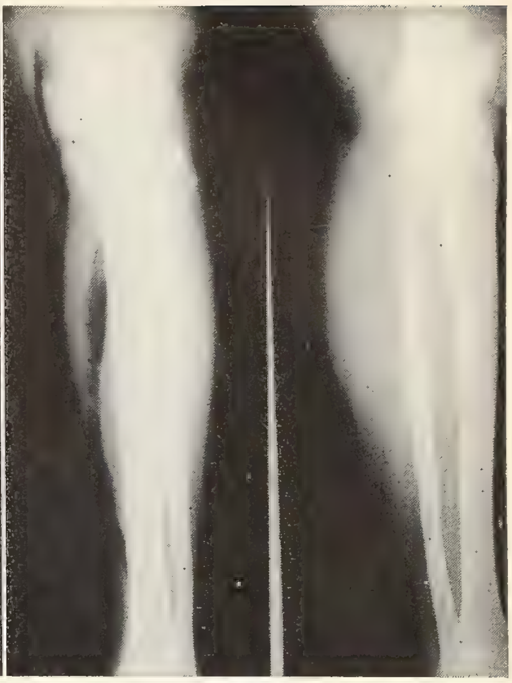

Fig. 3. Large amounts of gas between the muscles of the calf.

The edges of the perforation were necrotic and a large amount of very foul smelling pus could be seen coming from the area beyond the perforation. There was a considerable amount of pus in the rectum. The bowel was visualized to the 20 cm. level and no other abnormality was seen. It was then decided that we were dealing with a perirectal abscess secondary to a rectal perforation with extension of gas from the abscess into the left leg.

On the afternoon of May 9, 1952, the patient was again taken to the operating room where the abdomen was opened and a thorough exploration was performed. No evidence of perforation, peritonitis or abscess could be found. There was some induration along the lateral border of the rectum. A sigmoid colostomy was performed and the abdomen was closed. The patient was then placed in lithotomy position and the left ischiorectal space was opened widely. A large amount of foul smelling pus was encountered in this area.

Following these procedures the patient's condition improved rapidly. The colostomy was opened and the nasal suction tube was removed within twenty-four hours after surgery. On the sixth postoperative day the patient developed signs of thrombophlebitis in her left leg. Improvement followed treatment with anticoagulants and heat. The patient was discharged from the hospital in good condition on the twenty-first postoperative day.

Much speculation was indulged in by the various physicians who were interested in the case as to the mechanics of the spread of gas from the left ischiorectal fossa to the fascial planes of the left leg. After consultation with several authorities on anatomy and review of anatomical charts and specimens, it appears that the best possibility lies in the suggestion that the obturator membrane was torn during the fall. Since the first symptoms were those of severe pain in the left hip and deep pelvis, it is logical to assume that in the absence of a fracture that a tearing of the obturator membrane could produce such pain. When one examines the pelvic region on a skeleton or cadaver one sees the obturator membrane as the only real barrier between the ischiorectal fossa and the leg. In the absence of a more plausible theory we are quite satisfied with the above explanation of the mechanics of the findings in this case. An extensive review of the literature does not reveal the report of a similar case, and we feel certain that this is the first case of emphysema of the leg following perforation of the rectum to be reported.

Read at the annual meeting of the Southern Minnesota Medical Association, Austin, Minnesota, September 8, 1952.

TUBERCULOSIS AMONG DIABETICS

Tuberculosis among diabetics is a special, serious, and integral part of the whole problem of eradicating tuberculosis. The importance of early isolation of the patient with positive sputum should be stressed, as well as prompt hospitalization and institution of appropriate therapy. Reeducating the patient so that he will practice good living habits will do much to prevent future relapses.—David A. Cooper, M.D., and Katharine Boucot, M.D., *The American Journal of Nursing*, November, 1952.

President's Letter

NO ROOM

With the approach of the Christmas holiday, many of us will promise himself that this year it will be different. This year we vow that our shopping will be completed early. We vow that Christmas cards will be signed, sealed and ready for mailing so that all that we need do is drop them into the mail box at the proper time. We vow to put into effect long standing plans for a spectacular display on the front lawn. We will probably vow again not to go all-out on gifts, in the vain effort to reduce the shock of January bills.

In all of our vowing about the tangible aspects of the great day, we seem to leave no room for some of the intangible ones upon which the holiday is based. We often leave no room for thought or meditation on the real spirit of Christmas, the emblem of peace and good will toward all men. In a nation whose Declaration of Independence and Constitution are founded upon the concept of divine law, we need no reminder that Christmas is the birthday of Christ and not merely the time for the annual all night world-wide sleigh ride of Santa Claus.

This is not to state that we should abolish all of our traditional yuletide commemorations. It is only to urge that through the tinsel and holly, the candy and nuts, the popcorn balls and ornaments, the wrappings and gifts, should shine the greater radiance of the true spirit of Christmas.

Imbued with that spirit we will not give the same answer that was given to Mary and Joseph when they sought shelter. We will not deny that there is room in the inn for Christ. Let us prepare that room during the busy holiday season, a place in our hearts for the guest of honor.

May each of you enjoy a truly Merry Christmas and a New Year filled with happiness.

Roger L J Kennedy

CHANGE IN WASHINGTON

IN OUR representative form of government, one political party is likely to stay in power until conditions become so bad that the majority of citizens want a change. The change to another political party constitutes a safety valve and a substitute for armed rebellion.

The recent election constituted a repudiation, in no uncertain terms, of the Truman administration which was doubtless the result of numerous factors. How much the support given by many physicians to the Republican party had to do with the outcome is perhaps open to a difference of opinion. Physicians, however, as individuals and such groups as the National Professional Committee under the leadership of Dr. E. L. Henderson of Louisville, were very active in their opposition to the present administration and undoubtedly exerted a considerable influence.

When we consider how persistently Truman and his henchmen have tried to foist compulsory national health insurance on the people of this country, it is little wonder that determined opposition was undertaken by the medical profession. This attempt on the part of the present administration to take a further step towards socialism by placing the medical profession in the employ of the federal government was made in spite of strong indications that the majority of people were opposed to such a step.

We are informed* that in 1947 Senator H. A. Smith, chairman of a Senate Committee holding hearings on national health policy, wrote to the governors of the forty-eight states asking their opinion of the Wagner-Murray-Dingell Bill for federal compulsory health insurance and that not one governor favored the bill. The legislators of a number of the states had memorialized congress in the opposition to the program. Such representative organizations as the American Bar Association, the United States Chamber of Commerce, the American Farm Bureau Federation, the Federation of Women's Clubs and the American Legion have all adopted resolutions against the proposal.

The platforms of the two parties were diametrically opposed on two important issues, i.e., compulsory federal health insurance and federal aid to the medical schools. Eisenhower had come out clearly in opposition to federal compulsory health insurance and the Republican platform stated: "We are opposed to federal compulsory health insurance with its crushing cost, wasteful inefficiency, bureaucratic dead weight and debased standards of medical care." Although nothing was said in the Republican platform regarding federal aid to medical schools, Eisenhower had been active before his nomination in raising funds from private sources so that medical schools would not have to be supported by federal funds. He had said: "We must support medical education by private means because, if we don't, it would be the first step towards the socialization of medicine. I am against socialization." On the contrary, the Democratic platform flatly called for federal subsidy of medical education.

How does the AMA stand on national issues?

In the first place, it is opposed to federal compulsory health insurance, of course. It also believes that the support of medical schools is the function of state governments and individuals and that the federal government should not be called upon for funds except in cases in which dire need is demonstrated beyond a doubt, and then help should be limited to "one-time" grants for construction or equipment.

The AMA favors the Reed-Keogh bill, which is at present before Congress, and provides for measures to encourage the creation of pension funds for some 10 million self-employed persons including physicians to equalize pension provisions already in effect for the benefit of corporations and employes.

The AMA also favors the appropriation of federal funds for medical research and the provisions of the Hill-Burton Act for the encouragement of hospital construction.

What will be the new administration's attitude

**Christian Science Monitor,* November, October 27, 1952.

on the care of veterans for non-service connected disabilities, which has proven such a thorn in the flesh for the medical profession?

The new President will doubtlessly be committed to the principles of social security and he has expressed himself as in favor of improving and extending its provisions. Commitments have been made and those for old age and unemployment will have to be carried out. What will his attitude be toward the present dishonest disposition of tax funds for purposes other than those for which they were collected?

When it comes to balancing the national budget, however, that will lie in the lap of Congress. Whether Congress will be able to effect substantial economies will depend in the last analysis, as Congressman Judd has clearly pointed out, on the attitude of the constituents at home.

COST OF ANTIBIOTICS

ONE WAY in which the medical profession can assist in lowering the cost of medical care is in the prescribing of antibiotics—the newer wide-range ones, in particular. Too often the cost of drugs is given little or no consideration by the physician.

At the onset of the manufacture of certain drugs, the cost of manufacture is of necessity high. With larger scale production, price reductions occur if the manufacture and sale of the drug is open to competition. This was illustrated in the case of penicillin. Our attention was called recently to a bill rendered the Blue Shield only a few years ago which included a charge of $92.00 for one day's medication of 4 million units of penicillin for one patient suffering from pneumonia. Aside from the question of the need for any such dose, the cost today would be about a tenth of the figure mentioned.

An interesting editorial on the subject of the antibiotics* which appeared in a recent issue of the *New England Medical Journal* is instructive. Large-scale production and keen competition have resulted in repeated cuts in the price of penicillin. Not so with the so-called wide-range antibiotics. The manufacture of aureomycin, terramycin and chloramphenical (Chloromycetin) is controlled by patent rights assigned to individual manufacturers. Inasmuch as they cover much the same field of infection, the competitive factor will presumably result in price lowering as production increases.

The British, forced of necessity to conserve the export of American dollars for the purchase of American-made antibiotics, found in a small series of cases of pneumococcic pneumonia that the sulfas and domestically produced penicillin were just as effective as the expensive American-made antibiotics. In our own country, several series of bacterial pneumonia have been reported with no difference in effectiveness between penicillin and the newer wide-range antibiotics. While the small number of cases reported is perhaps not enough to be conclusive, the results are strongly suggestive. This applies to the pneumococcic and bacterial pneumonias. Where there is suspicion that the patient is suffering from a so-called atypical or virus pneumonia, there may be good reason to select an antibiotic other than penicillin. In the editorial mentioned, it is interesting to note that the use of 1 gram a day of aureomycin or chloramphenicol seemed effective in eighty-one of the 100 cases reported from a large hospital in Seattle, Washington, which was about one-fifth the amount used in the British investigation.

A further means of effecting an economy in time and effort for the hospital nurse and added comfort for the patient is the adoption of a single injection in the twenty-four hours of a high concentration of penicillin. This dose has been shown to produce therapeutic blood levels lasting the entire twenty-four hours. The injection of penicillin every four hours to a sick patient should have been abandoned long ago.

Our thought is that, whereas the wide-range antibiotics are indicated for certain diseases, their use is extravagant for infections just as well controlled by penicillin or—aspirin.

MINNESOTA MEDICAL FOUNDATION

AT THE annual meeting of the Minnesota Medical Foundation held at the University of Minnesota on October 2, 1952, thirteen scholarships of $500 each were presented to undergraduates in the medical school. The recipients were Charles Gamble, Barbara Hanson Subak, Karl Palmer, Bertram Woolfrey, Gene E. Meger, Robert Radke and Maynard Jacobson, members of the sophomore and junior classes. Six additional scholarships, made available by the efforts of Dr.

---

*Editorial: Choice of therapy for pneumonia. New England J. Med., 247:736 (Nov. 6) 1952.

Donald J. Cowling to graduates of state colleges, were presented to the following members of the freshman class: Duane Flagstad, Eugene W. Hanson, Harlis Hanson, Gerald Kuss, Curtis Stolee and Ernest Swanson.

The presentation was followed by an address by Dr. William S. Middleton, Dean of the University of Wisconsin Medical School, on "The Springs of Medical Strength."

The dinner meeting held at the Campus Club was presided over by Dr. Owen Wangensteen and greetings were brought by Dr. Horns in the absence of Dr. Diehl.

In the absence of Dr. Vernon Smith, chairman of the Membership Committee, Dr. Francis W. Lynch reported a total membership of 1,035.

Dr. Moses Barron, Minneapolis, Dr. Ray Hedin, Red Wing, and Dr. Herman E. Drill, Hopkins, were elected to the Board of Trustees.

The meeting was concluded with a memorable impromptu talk by Dr. Cowling on the American system of education and the problems that confront medical education in particular.

EPIDEMIC RINGWORM OF THE SCALP

IN VIEW of the fact that recently there has been a serious outbreak of epidemic ringworm of the scalp in the Grand Forks, North Dakota, area which has spread to East Grand Forks, Minnesota, we are publishing in this issue a release on the subject received from the Minnesota Department of Health.

Epidemic ringworm of the scalp is a contagious disease and reportable in Minnesota. Minnesota suffered from quite a serious epidemic in 1945, when the disease was first made reportable. At that time some 805 cases were recorded, for the most part in Saint Paul. Means to combat the infection were successful so that few cases have been reported in recent years. However, up to November 18 of this year, some seventy-one cases have been reported, forty of them in East Grand Forks school children.

The physicians of the state should be on the lookout for this highly contagious form of ringworm of the scalp so that needed quarantine measures can be instituted. An accurate diagnosis is impossible without the use of a Wood lamp and laboratory culture. Infected hair may be sent to the State Board of Health on the University Campus for culture and diagnosis.

The treatment of the disease is notoriously unsatisfactory. Hence, emphasis is placed on prevention of spread by local Health Officers.

EPIDEMIC RINGWORM OF THE SCALP

(*Tinea capitis* caused by *Microsporon audouini)*

History.—Epidemic ringworm of the scalp has been recognized for years, and sporadic cases have occurred in many areas. The disease became epidemic in Europe and the British Isles after the first World War. Shortly after 1940, the condition reached serious proportions on the East Coast of the United States and gradually spread westward. It was first called to the attention of the Minnesota State Board of Health by Twin City dermatologists, late in 1944. Epidemic ringworm of the scalp was made reportable in Minnesota in March, 1945.

Characteristics.—The outstanding feature of this infection is its insidiousness. Epidemic ringworm due to *Microsporon audouini,* may exist for months before it is recognizable. Those accustomed to dealing in the past with less serious forms of ringworm of the scalp may be woefully led astray in trying to apply past experience to this condition. Except in rare instances, *do not* expect to find marked inflammation, induration, bogginess and pustulation such as may occur in other forms of ringworm commonly seen in children. Epidemic ringworm, due to *M. audouini,* occurs much more commonly in boys and the sites of predilection are the occipital area, around the base of the head, and the sideburn area. It is extremely rare after puberty. Lesions usually are single, to begin with, and may vary from a single, infected hair up to large patches with involvement of most of the scalp. The scalp in the involved area usually exhibits a fine scaling with pin-head sized adherent scales, the so-called "cigaret-ash" scale. Inflammation is not a feature until the infection reaches an advanced stage and usually is never marked. The hair in the infected areas gradually loses luster, becomes brittle and finally breaks off or falls out. In neglected cases, permanent baldness may result.

Transmission.—Epidemic ringworm is spread through direct contact, child to child, or through the medium of such contaminated objects as caps, combs, towels, backs of theater seats, barber tools, et cetera. This mode of spread contrasts with that of the non-epidemic scalp ringworm which is contracted usually from contact with an infected animal such as a dog, cat or calf.

Diagnosis.—In early cases, diagnosis is impossible if simple inspection alone is relied upon. The greatest single aid in detection of early cases is by examination under filtered ultraviolet light, the so-called "black light," using a Wood lamp. Under this light, infected hairs glow or fluoresce with a blue-green light. With experience the characteristic fluorescence seen in ringworm is easily distinguished. This procedure, however, is not diagnostic, as both the epidemic and non-epidemic types of ringworm may show fluorescence under the Wood light. For positive diagnosis, recourse must be made to laboratory examination. Fluorescent hairs should be plucked and submitted for examination. By staining and cultural characteristics and microscopic appearance, the type of ringworm can be determined. When fluorescence is present, failure to find the organisms in a single culture should not be taken as proof of absence of infection. Laboratory service is available to physicians through the Minnesota Department of Health, University Campus, Minneapolis. Special outfits are provided for the submission of specimens.

Treatment.—The usual treatment is to shave the infected area or remove the infected hairs with tweezers if they are few in number. Fungicides are then applied locally. There have been reports of good results following the use of ointments containing undecylenic acid. The infected area is marked out and an area including one inch of surrounding hair is shaved. If extensive, the whole scalp may be shaved. The fungicide is applied according to specific directions and rubbed in well twice a day. Patients should be examined under the filtered ultraviolet light at weekly intervals.

In resistant cases, x-ray epilation may be necessary. Such epilation should be done only by an experienced operator. Epilation with thallium acetate should not be attempted, as the effective dose is too close to the toxic dose. It should also be pointed out that there have been several reports of neurotoxic reaction following the use of "Asterol." If this material is used, the manufacturer's directions should be closely observed, especially in very young children. Hormone therapy has little value.

Prevention.—Prevention is essentially avoidance of contact either direct or indirect with an infected child. Children should be warned not to exchange caps, combs, towels, et cetera. Frequent shampooing is advisable, especially after visits to the barber or theater. Infected children should wear a light stocking cap or other head covering which should be washed daily. They should be excluded from school while there is any danger of transmission of the infection to others. When a case is found, all children in the same family should be examined and re-examined at intervals of about two weeks.

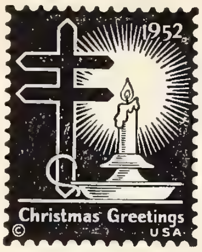
Examination or treatment of the condition should not be attempted without the use of a Wood light.

Cases of epidemic ringworm are required by state health regulation to be reported to the local health officer in the same manner as other reportable diseases *(See* Regulation 301).

November 17, 1952.

Because the control of tuberculosis is a universal problem, found in all areas everywhere, the program must be shared by all agencies working together, official and voluntary. This means that the disease must be found, isolated, and treated and that efforts and methods for control must transcend the boundaries of a single state, local area, state or nation. The cost of fighting tuberculosis is very great and the problems it produces are many and complex. . . . Efforts to control it and eventually to eradicate it require most intensive work on local, state, national and even international levels of action.—Mabel Baird, *Connecticut State Medical Journal,* May, 1952.

Help Fight TB



Buy Christmas Seals

CHRISTMAS SEALS

David T. Smith, M.D., of Durham, N. C., Professor of Bacteriology and Associate Professor of Medicine of Duke University, and former president of the National Tuberculosis Association, sounded a warning note against over-optimism over the declining tuberculosis death rate when he addressed Minnesota Christmas Seal workers in October. The occasion was the annual dinner of the Minnesota Tuberculosis and Health Association. It was held at the Coffman Memorial Union, University of Minnesota.

Dr. Smith said the case rate, and not the death rate should be emphasized. He called attention to the fact that 118,438 new cases of tuberculosis were reported in the United States in 1951, and that 2,208 of them were right here in Minnesota.

The following is an abstract from Dr. Smith's talk:

"Tuberculosis can be eliminated as surely as leprosy was eliminated from Western Europe between 1300 and 1600 A.D. but this cannot be accomplished in one generation. A child acquiring its tuberculous infection at the age of three, as shown by a positive tuberculin test, may not develop clinical tuberculosis until the age of eighty.

"As the final stages of the fight against tuberculosis are reached, the expense of hospitalization and treatment will be materially reduced but the expense of case-finding, including tuberculin testing the entire population and x-raying all positive reactors annually, will be increased.

"Finally, when the number of tuberculin reactors becomes small, the cost of the annual x-ray will be insignificant. A little more investment in case-finding now will save millions of dollars later in the prevention of new clinical cases which require expensive sanatorium treatment.

"The rapid, precipitous decrease in the death rate from tuberculosis since 1947 can be attributed primarily to improved medical and surgical treatment. The death rate can no longer be used as even a rough index of the frequency and importance of this disease. The decrease in death rate has not been accompanied by a corresponding decrease in the rate which new cases are developing. There are reasons for believing that many active cases remain undetected in the population and form a source for new infections.

"The remarkable progress in the control of tuberculosis in Minnesota is the direct result of the active control program and not the spontaneous effect of a rising standard of living or other non-specific factors.

"The control program for the future should be expanded to include a tuberculin test for every individual in the state with an annual x-ray of every positive reactor and an annual tuberculin test for every negative reactor. The money saved in treatment, by detecting the new cases in the incipient rather than the moderately advanced stage of the disease should be more than enough to pay for the increased cost of the expanded case-finding program when once the complete program has been activated."

The forty-sixth Annual Christmas Seal sale opened in Minnesota, November 17. The seal design features the double-barred cross, international insignia of the fight against tuberculosis, and a lighted candle in an old-fashioned holder, symbolizing the light of knowledge spread by the Christmas Seal.

Medical Economics

Edited by the Committee on Medical Economics
of the
Minnesota State Medical Association
George Earl, M.D., Chairman

BUSINESS GROUP TO PROMOTE MEDICAL CENTERS

On October 30, 1952, the American Federation of Medical Centers announced its beginning as a national non-profit organization formed by businessmen and doctors to "show communities how to provide modern, comprehensive medical care to individuals at a cost of one to two dollars a week."

The American Federation of Medical Centers, Inc., plans to start community medical centers, based on business' methods. According to its recent announcement, "this comprehensive medical care will be provided by a self-contained team of physicians, dentists and nurses and other necessary personnel who will work together as the staff of a community medical center."

Three-Point Program Cited

Formed to work with other organizations in the fields of health and medicine, and to assist in the development of a program for community medical care, the group states that its program is based on three points:

1. The establishment of self-sustained *medical centers* with clinical, hospital, and other necessary facilities for providing modern medical care.
2. The operation in these centers of *efficient group practice,* made possible through selected teams of general practitioners, specialists and other personnel.
3. The creation of a system of *voluntary prepayment for medical care* in which each individual will receive preventive and curative medicine.

The group's report places emphasis on the need for medicine to adopt the methods of industry and business in order to provide more efficient medical care. It states that medicine must "become a self-respecting business which pays its own way."

Explaining further, the report says:

> "Throughout the period of its great progress, medicine has been put in the position of seeking money to meet its ever-expanding, ever-recurring needs for facilities and support—particularly for education and research. Industry, either directly or indirectly, has been supplying much of that money by means of grants and foundations. It has been making contributions to hospital drives, costly plans for plant medicine and in other ways.
>
> "Yet industry has paid too little attention to the medical care this money buys—the kind of facilities provided, or their location with relation to needs. Medicine, on the other hand, has had to do much with little—spreading its pennies as emergency or expediency dictated."

"Neither industry nor medicine has received the return it should have had for its investment," the report continued. "To remedy this inequity, medicine itself must become a self-respecting business which pays its own way."

Advocates Group Practice

In presenting its plea for public support of the plan, the announcement states that the individual doctor, conscientiously striving to provide adequate medical care, is being swamped by the forces of America's highly industrialized and organized society. After stating that the doctor is usually forced to work alone, the report goes on: "By associating himself with other doctors in team practice, with better facilities, and, in many cases, relief from financial problems, the doctor will, like specialists in all other fields, produce a superior product—better medical care—as a member of a team. Every qualified physician and dentist will have an opportunity to join the group."

Personnel of the American Federation of Medical Centers include Wendell W. Anderson, chairman of the Board, and Dr. Edgar H. Norris, its founder, a physician formerly from Minnesota. Mr. Anderson and Dr. Norris, in announcing the initiation of the plan, state that the group "is convinced that medicine's real weakness is not in the quality of medical care which is superb in some areas, but in the uneven distribution of such care nationally." The announcement followed a six-year study of the national problem of medical care.

As far as doctors of Minnesota are concerned, this new project has not been presented to the Minnesota State Medical Association, and the Association has not been made familiar with the details of the set-up and operation, nor with what the definite purpose is. It is believed that medicine should be very cautious in accepting this proposal until it has been thoroughly studied.

SENATE COMMITTEE PLANS VA HEARING

The Senate Government Operations Committee, chairmaned by John L. McClellan of Arkansas, will call a hearing in mid-January, 1953, on the management survey report of the Veterans Administration. This report has not been made public. It was completed last spring by a private firm and amounted to a $605,000 complete investigation on VA operations, including medical activities. The firm's recommendations have been studied by various VA officials.

The committee staff, upon adjournment of Congress last July, began studies into operations of the Veterans Administration, according to a recent issue of *Capitol Clinic*. This study emphasized hospital construction, utilization of hospital facilities and medical personnel and on the possibilities of improving the administration of the veteran's insurance program.

MEDICAL SCHOOLS SET NEW RECORD ENROLLMENT

More and better financial support and an unprecedented increase in teaching facilities since World War II have combined to bring facilities for medical education in the United States up to an all-time high. This analysis was contained in the summary of a report on medical education in the United States and Canada by the Council on Medical Education and Hospitals of the American Medical Association.

The report showed that enrollment records were broken for the fourth consecutive time in the seventy-two medical and seven basic science schools in this country. In the 1951-52 academic year, there were 27,076 medical students enrolled in United States schools as compared with 26,186 in the preceding year. This is a 3.4 per cent increase. The report states:

"In the five years before World War II, there was an annual average enrollment of 21,514 students. The present total represents an increase of more than 25 per cent. The five-year pre-war average of freshmen students was about 5,800. The latest figure is an increase of about 28 per cent."

New Peacetime Record Set

There were 6,080 students graduated this year, the report noted—a record number for a regular schedule. The only previous surpassing record was in 1947 when the termination of the accelerated wartime schedule resulted in graduation of more than one class by several schools. The total for that year was 6,135 graduates; estimated students graduating next year is 6,500.

Expansion Funds Noted

Since the end of World War II, the report stated, more than $300,000,000 has been spent in expansion of medical school facilities. In addition, some thirteen projects designed to found new schools or expand two-year schools into four-year schools, are now under way. Total operating expenditures, including research, increased in the past year from $109,000,000 to $120,000,000.

Criticism Cited

In commenting on the over-all expansion of medical school facilities, the report said:

"In the period after the war, medical schools and medical educators were subjected at times to severe and unfair criticism for not expanding their facilities more rapidly or extensively. It is to the credit of the medical schools that they insisted that, if proper standards were to be maintained, increases in enrollments would have to be accompanied by the provision of additional capital facilities and by additional operating funds."

The report also gave credit to the American public for increasing its investment in medical education: "It is equally to the credit of the American public that it was willing to increase its investment in medical education so that additional students could be accommodated without lowering the high standards of medical education that several generations had striven to create in this country.

"Through increased legislative appropriations, federal grants in aid, gifts for endowment and current expenses, alumni funds, and, more recently, the efforts of the National Fund for Medical Education and the American Medical Education Foundation, the funds available to the medical schools have been more than doubled since the end of World War II . . . medical education is better supported today than at any time in its history and American medical schools as a group are conducting programs of education and research that far surpass both qualitatively and quantitatively any of their previous efforts."

Minnesota Academy of Medicine

Meeting of March 12, 1952

The regular monthly meeting of the Minnesota Academy of Medicine was held at the Town and Country Club on Wednesday evening, March 12, 1952. Dinner was served at 7 p.m. and the meeting was called to order at 8:10 p.m. by the President, Dr. O. H. Wangensteen.

There were forty-three members and one guest present.

Minutes of the February meeting were read and approved.

There being no business to come before the Academy, the scientific program followed.

Dr. Roy E. Swanson, of Minneapolis, read his inaugural thesis.

THE ANTEPARTUM DIAGNOSIS OF ANENCEPHALIC MONSTER

A Report of Six Cases With Induction of Labor

ROY E. SWANSON, Ph.D., M.D.
Minneapolis, Minnesota

Anencephalus is the most common of single monsters. Its occurrence is a tragedy to the parents and is most embarrassing to the obstetrician when its presence is not suspected for such a severe abnormality precludes its ability to survive and its early recognition cannot be too heavily stressed. The termination of the pregnancy is obstetrically sound and psychologically correct.

The etiology of fetal monstrosity is still in dispute. Both the germinal and unfavorable environment theories have advocates. Recent work on the administration of a massive dose of Cortisone to pregnant mice in the early days of pregnancy has shown a tremendous increase in fetal abnormality, especially hare lip. The high incidence of abortions in mothers bearing monsters, may be included in either theory. Monsters are not uncommon in placenta previa where environment with a faulty placenta-fetus relationship may be the factor. Adair's study of fetal malformations in twins, with the constant association of hydramnios with the monster twin, is certainly suggestive of the fetal origin of this condition. Goldmaier found nine out of twenty-two monsters hereditary. Murphy of the University of Pennsylvania in his monograph, "Congenital Malformations," inclines to the germinal theory. He states that in families already possessing a malformed child, the birth of a subsequent malformed child takes place with a frequency which is in the neighborhood of 25 times greater than that of the general population. He also states, "In families containing two malformed siblings, the subsequent defective child is more likely to be born later in the family than it is to be the next child in the order of birth to the first defective sibling; and the defect in both was identical in 50 per cent of the instances." Reports in the literature of two or three consecutive defective siblings are not frequent.

The incidence of monstrosity varies with age, parity and heredity. Mall states, that seven pregnancies out of every hundred give pathologic ova of which but one-third give well formed embryonic monsters, or 2 per cent of all pregnancies. The number of monsters going to term is said to be 0.6 per cent. It seems only kind, that whenever parents have had a monster born to them, they should be told the statistical facts: Murphy's reassuring statement that the sibling, following the monster, is unlikely to be defective, but that their general risk in subsequent pregnancies is twenty-five times greater than in the general population. They should also be told that about 75 per cent of monster pregnancies are aborted spontaneously and should they wish to take this risk they can be promised careful watching and early diagnosis. The termination of such a pregnancy can be promised.

The diagnosis of anencephalic monster is based on: (1) absence of the fetal head, (2) inability to determine accurately the presenting part, if it is a vertex, (3) abnormality of the presenting fetal head, (4) acute hydramnios, (5) convulsive fetal intrauterine movements from pressure on the foramen magnum, (6) peculiar changes in the fetal heart rate, (7) occasionally very sluggish motion, (8) x-ray findings.

Careful search of the literature reveals that this condition is too infrequently diagnosed before delivery, before term or before the rupture of membranes. Case in 1916 claims to have made the first x-ray diagnosis of anencephaly antepartum. Hartung's report antedates his, by several months. Since then many x-ray diagnoses have been made.

Once the diagnosis of anencephalic monster is made, pregnancy should be terminated at once by conservative means if possible, or by radical procedures depending on the age of the mother, the number of pregnancies, the presence of other abnormal siblings and the wishes and religion of the parents. In the Catholic Moral Doctrine termination is permitted at the age of viability.

I wish to report six cases of anencephalic monstrosity with the clinical dignosis made antepartum, confirmed by x-ray. Five of the pregnancies were terminated by rupture of the mebranes and the sixth by cesarian hysterectomy. All six monsters were female. All mothers recovered nicely.

Case 1.—Mrs. L, gravida I, para O, thirty-six weeks, aged twenty-six. Routine prenatal case except for last two and one-half months while at the lake in northern Minnesota. On her return on September 22, 1941, office diagnosis of hydramnios with monster made—confirmed by x-ray. Membranes artificially ruptured at hospital September 23. A stillborn female monster was delivered eight hours later. Autopsy. Serology negative. Laboratory negative.

Case 2.—Mrs. B, gravida I, para O, thirty-two weeks, aged twenty-five. Sudden hydramnios. X-ray showed anencephalic monster. Membranes ruptured. A female monster was delivered by the breech four hours and forty minutes later. Recovery. Serology negative.

Case 3.—Mrs. N, aged twenty-eight, Gravida IV para III, twenty-eight weeks. Recent hydramnios—breech presenting x-ray diagnosis of anencephalic monster. Labor induced by rupture of membranes. Female delivered by the breech in one hour and thirty-seven minutes. Two living normal children; one stillborn (previous) (?)

Case 4.—Mrs. S, aged forty, Gravida II, para I, twenty-eight weeks. Patient was seen in consultation in hospital for abdominal tumor and intermittent bowel obstruction. Found to be pregnant four months. About two months later acute hydramnios. X-ray confirmed diagnosis of anencephalic monster. Terminated by cesarean hysterectomy and release of intestinal band producing partial bowel obstruction. Female.

Case 5.—Mrs. H., twenty-four years old, Gravida II, para I, twenty-eight weeks pregnant. Recent hydamnios. Diagnosis of anencephalic monster made January 20, 1948. Confirmed by x-ray January 24, 1948. Labor induced January 24, 1948, by rupture of membranes. Three-hour labor. Female.

Case 6.—Mrs. H, twenty-one years old, Gravida I, para O, EDC July 15, twenty-eight weeks. Sudden increase in size of abdomen this week. No motion for four days. On April 22 diagnosis of anencephalic monster was confirmed by x-ray. Labor was induced April 22. Female monster.

Summary

The diagnostic problem in the early recognition of anencephalus is a matter of attention to detail and good prenatal care. Hydramnios is a most consistent finding and may appear very suddenly. Examination of the presenting part if it is the head is instructive. X-ray is conclusive. Termination of pregnancy is indicated. In order that a monster pregnancy be recognized and promptly terminated, the points in its recognition should be kept constantly in mind and x-ray studies when there is the slightest doubt.

Discussion

Dr. L. G. Rigler (Minneapolis): Dr. Swanson has called attention to a finding in the x-ray films of pregnant women which has been recognized for a long time, but certainly very few cases have been recognized in the early stage which he exhibited. Most of the patients that I, myself, have seen have been found more or less accidentally by x-ray examination, the diagnosis not having been suspected from the clinical story. I have never personally seen one as early as one of those which Dr. Swanson showed. I am sure that he has done us a service by calling attention to historical and clinical indications for x-ray examination to determine the presence of anencephaly. The diagnosis itself is not difficult if good radiographs are made and careful attention is paid to the skeleton of the fetus. The finding, however, is so uncommon that I would scarcely believe it justified to advocate routine x-ray examination of pregnant women in order to make a diagnosis. I do think that more attention should be paid to the signs which Dr. Swanson has indicated and x-ray examination done under these circumstances.

Dr. R. T. La Vake (Minneapolis): Dr. Swanson has brought out clearly the importance of being suspicious of fetal abnormality in the presence of hydramnios and has demonstrated the value of x-ray in all cases where you question the normality of the child.

As to the prospects of future normal children after such abnormalities, I would like to introduce a note of optimism. A patient of mine began her childbearing career with three successive lethally defective children. Following the clear direction of statistics, I counseled agaist her becoming pregnant again. This advice she did not follow and her last three children proved to be normal and have remained so.

Dr. A. G. Schulze (Saint Paul): Is there any explanation of polyhydramnios?

Dr. Wallace P. Ritchie (Saint Paul): I would like to ask Dr. Swanson a question. This concerns the subject of the hydrocephalic infant. We see a great many of them during the year and they develop very shortly after birth. Can one determine early hydrocephalus *in utero*, say between the third and fourth months?

Dr. Harold F. Flanagan (Saint Paul): In my experience there are very few anencephalics, but many more hydrocephalics. While I agree with Dr. Swanson that it might be well to terminate the pregnancy, I think one must have all the criteria before terminating a pregnancy. There is not the problem in delivery in the anencephalic monster that there is in hydrocephalus. Others may not all be quite as competent in reading x-ray findings as are Dr. Rigler and his associates.

Dr. Swanson (in closing): In reply to Dr. Schulze's question, hydramnios very often accompanies anencephalus and it is thought to be due to the open condition of the skull and spinal canal with excessive amounts of cerebrospinal fluid being formed. The fetus swallows and inhales fluid *in utero* which is handled through the maternal circulation, and in anencephalus the brain abnormality interferes with this function and hydramnios results (Potter).

Dr. La Vake mentioned one mother with three defective children followed by three normal siblings. This does not change the statistical fact that these women run a risk twenty-five times greater than the normal woman.

In reply to Dr. Ritchie's question regarding the diagnosis of hydrocephalus at three to four months of gestation, all I can say is that this condition is seldom present at birth except with spina bifida and, since it is mostly obstructive, it probably could not be picked up by x-ray this early.

I would reply to Dr. Flanagan that the diagnosis of anencephalus is simple and the x-ray need not be read by an expert. The absence of the calvarium is conclusive. He states that they are rare. I have described six cases in this presentation diagnosed between four and six months and I know of many additional cases here in Minneapolis not diagnosed until birth, which does not make this rare. He believes that the family should not be told and that the pregnancy be allowed to terminate itself, since labor presents no problems. The purpose of this paper was to show that the diagnosis could be made early and that, since these children never survive, the termination of pregnancy was obstetrically correct and justified.

Dr. Edward P. Burch, of Saint Paul, read a paper.

ADVANCES IN CATARACT SURGERY

EDWARD P. BURCH, M.D.
Saint Paul, Minnesota

From the time of Daviel until approximately twenty years ago, relatively few advances in the techniques of cataract surgery took place. A notable exception was the introduction of cocaine as a local anesthetic by Koller in 1882. Except for improvements and refinements in the instruments commonly used in the extraction of senile cataracts, however, very little progress was made until the early nineteen thirties.

For many years the classical operation for cataract consisted of local surface anesthesia with cocaine, corneal section with the von Graefe knife, a complete iridectomy, and capsulotomy with cystitome or toothed capsule forceps. While some operators employed various types of conjunctival flap which were closed by means of interrupted silk sutures, others employed no flap or sutures whatsoever. This technique imposed upon the patient the burden of remaining virtually immobile in bed with both eyes occluded for from five to seven days. Because of the fact that the vast majority of cataract patients are well-advanced in years, the ordeal of cataract surgery was not inconsiderable. Since the extra-capsular method of extraction was generally in vogue, many individuals were advised to wait until the lens opacities became mature and were thus condemned to many months, and even years, of visual incapacity. Post-operative iritis and prolapse of iris were commonly encountered as complications.

About twenty years ago there began to evolve the modern operation for senile cataract. Pontocaine, which enjoys several distinct advantages over cocaine, was introduced, more adequate anesthesia was obtained through retrobulbar injections of novocaine, corneoscleral sutures of many varieties came into widespread use, and the intra-capsular technique of extraction with forceps or erisophake was popularized. As a consequence of these advances the operation was rendered immeasurably safer, there were fewer operative and post-operative complications, and in many instances surgery was performed at a much earlier stage of development of the lens opacity. Somewhat greater freedom of movement and earlier ambulation also became feasible.

It might be of interest to discuss in some detail those advances which have taken place in the last twenty years or so. Pontocaine, which was first employed as an ophthalmic local anesthetic was introduced by Wilmer and Paton in 1931. It has the advantage over cocaine of possessing better anesthetic qualities and neither dilates the pupil nor desiccates the cornea. At the present time chief reliance, as far as anesthesia is considered, is placed upon the retro-bulbar injection of some type of local anesthetic such as 2 per cent novocaine. Unless the patient is suffering from hypertension a small amount of epinephrine is added to the novocaine. Quite recently hyaluronidase has been added to the anesthetic. This definitely seems to be an advantage from the standpoint that smaller amounts of anesthetic solution become necessary to produce adequate anesthesia. In addition the percentage of satisfactory nerve-blocks is increased. This in turn decreases the likelihood of vitreous loss. As a rule, if the H. Gifford type of retrobulbar injection is employed, the eye becomes extremely soft and it is more judicious to employ the orthodox technique of retrobulbar injection if an extra-capsular extraction is contemplated in advance, since the profound hypotony which often ensues after the Gifford type of block may render actual extra-capsular delivery of the lens quite difficult. It has recently been demonstrated that 1 per cent xylocaine is also an excellent anesthetic agent for deep orbital injection and akinesia of the lids. Xylocaine as well as novocaine may be combined with either epinephrine or hyaluronidase, or both. The impression has been gained that if an intracapsular extraction is planned, xylocaine may be superior to novocaine, since marked hypotony, together with excellent ciliary ganglion and motor block and akinesia, has been noted in a very high percentage of cataract patients receiving xylocaine.

While routine lens extraction with general anesthesia under sodium pentothal-curare has recently gained some advocates, it seems unnecessary to subject the majority of patients to the slight but definitely added risk which this procedure entails. Very possibly its greatest usefulness is for the small group of patients who are unduly apprehensive, completely deaf, or psychotic. It is also useful when, because of faulty retro-bulbar injection, there is a tendency for what H. Gifford has termed a positive vitreous pressure or thrust to develop. If such a complication ensues after the corneal section has been accomplished, the operation may be briefly halted and intravenous Baird's solution administered. This will usually cause the eye to assume a more normal vitreous pressure, probably because of the action of curare upon the extra-ocular muscles.

Undoubtedly, the single most important technical improvement in the extraction of the lens is the almost universal use of some type of corneoscleral suture, either with or without a conjunctival flap. The number and variety of sutures employed is virtually legion. Both mildly-chromicized catgut and fine black silk sutures are being used. The corneo-scleral suture permits much more freedom in bed to the patient, allows earlier ambulation and discharge from the hospital. It has rendered postoperative occlusion of both eyes quite unnecessary. Corneo-scleral sutures greatly lessen the threat of iris prolapse. They reduce the amount of astigmatism, promote earlier reformation of the anterior chamber, and decrease the incidence of hemorrhage into the anterior chamber. It has been found perfectly safe and feasible to discharge patients from the hospital in six or seven days following operation. Twenty-five years ago the majority of cataract patients were hospitalized from ten to fourteen days. A very substantial saving in hospitalization costs has therefore become possible due to the use of corneo-scleral sutures.

Such sutures also permit the preservation of a round pupil in the majority of operations for cataract. The cosmetic effect is infinitely better if it is not necessary to carry out a complete basal iridectomy.

The chief advantage in the use of absorbable, mildly chromicized, catgut sutures over silk is that the removal of the latter type is always attended by some slight but ever-present risk. It is not advisable to remove silk sutures before the ninth or tenth post-operative day, a factor which necessitates a longer period of hospitalization than if catgut sutures are employed for wound closure.

Since the advent of the sulfa drugs and the antibiotics, potent agents are available to sterilize the conjunctival sac before operation and to combat infection in the untoward event of post-operative infection. For the former the broader spectrum antibiotics are preferable. Cortisone, a relatively recent agent in the ophthalmic armamentarium, can be of great value in checking post-operative iritis, particularly that variety which is due to retained lens substance following extra-capsular extraction.

The accompanying tables represent the complications and results in a series of 100 consecutive, private patients operated upon at the Charles T. Miller Hospital, Saint Paul, Minnesota, during the first five months of 1951.

In every instance 000000 chromic catgut was employed with atraumatic needles attached. The operative technique, which was employed with almost no variation, consisted after the usual skin preparation of injecting the lids and retro-bulbar space with xylocaine or novocaine-epinephrine as described by H. Gifford. The deep injection with 4.5 cm. needle was not employed when an extra-capsular extraction was in prospect. In these instances the 2.5 cm. needle was used. The corneal section was made with a keratome in all but a few instances. The keratome incision was enlarged by means of Maguire or Aebli scissors. If the pupil was sufficiently dilated to permit a safe extraction of the lens through the pupil a peripheral iridectomy was carried out. In all cases where the pupillary aperture was considered to be too small to deliver the cataractous lens through the pupil, or if anterior synechiae were noted, a complete iridectomy was done. Following the iridectomy, 000000 chromic, catgut sutures were inserted at one-thirty, twelve, and ten-thirty o'clock. These sutures were direct, cornea to sclera, appositional sutures. After the sutures had been looped out of the way in such a manner that they did not interfere with delivery of the lens, the actual extraction of the lens was carried out. Following most extra-capsular extractions air was injected into the anterior chamber. If a round pupil extraction was performed, a solution of 1 per cent pilocarpine was instilled in the anterior chamber since eserine is ineffectual after ciliary-ganglion block. If a complete iridectomy was carried out 1 per cent atropine was used instead. A 0000 black silk suture was then placed centrally near the free margin of the upper lid and taped to the cheek. Only the operated eye was bandaged.

Total cases	10
Pre-operative Complications	
Glaucoma	5
Diabetes	10
Iritis (old healed)	3
Total cases	18

The placement of direct, appositional, catgut sutures is not difficult and no significant over-riding will occur if the sutures are meticulously placed. Three such sutures are adequate, although one or two additional sutures may be added if the patient has a severe cough or the surgeon has reason to believe that the patient will become excessively restive.

Discussion

Dr. H. W. Grant (Saint Paul): I have been very interested in this discussion. Dr. Burch performs a large number of cataracts and does them very well. One can eliminate infections by the use of antibiotics; therefore, infection is no problem now. Anesthesia has also markedly improved. Anesthesia must be deep as there is immediate expulsion of the contents of the globe under coughing. However, I have used general anesthesia a little but find it unnecessary.

I believe that you must use catgut, as it is advantageous if the suture should pull through the appositioned edge of the wound. With catgut one gets proliferic changes not present if silk is used.

The most important part of cataract surgery is to handle the crises arising during surgery. Intracapsular extraction is here to stay. Each cataract surgeon should work out a technique which is satisfactory to him.

Dr. C. N. Hensel (Saint Paul): Since most of the patients are in the sixth, seventh and eighth decades, and since Vitamin B and C are water-soluble, we find in these people that Vitamin C is of great value. I would like to ask Dr. Burch if he feels that Vitamin C is advantageous in these individuals?

Dr. Burch (in closing): Yes, I agree with Dr. Grant regarding the hazards of general anesthesia in cataract surgery. We prefer to have the patient awake.

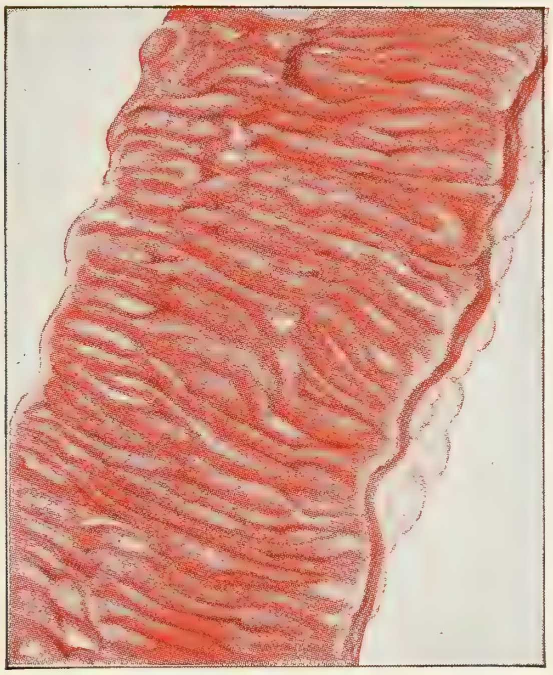
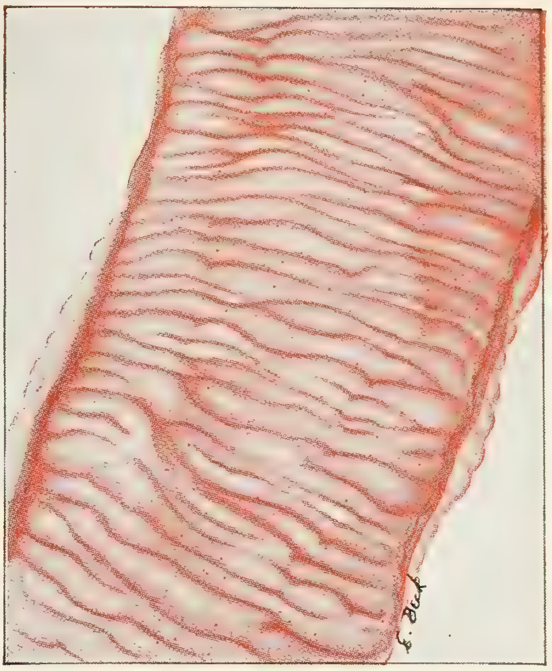
Promotes Normal Peristalsis—Without Injury to Mucosa



Irritated, injected mucosa such as is produced by roughage.



Mucosa remains normal following Metamucil.

Metamucil produces "a smooth, highly glistening mucosa and an increase in the tone of the bowel musculature."*

With Metamucil's "smoothage" management of constipation there is no irritation, straining or impaction—and no interference with digestion or absorption of oil-soluble vitamins.

Metamucil powder is taken with a full glass of cool liquid—producing an adequate quantity of bland, plastic, water-retaining bulk which mixes intimately with the intestinal contents and is distributed evenly through the digestive tract.

ACCEPTED COUNCIL ON PHARMACY AND CHEMISTRY AMERICAN MEDICAL ASSOCIATION

METAMUCIL® is the highly refined mucilloid of Plantago ovata (50%), a seed of the psyllium group, combined with dextrose (50%) as a dispersing agent.

SEARLE RESEARCH IN THE SERVICE OF MEDICINE

◆ Reports and Announcements ◆

ANNUAL CONGRESS ON MEDICAL EDUCATION AND LICENSURE

The Forty-ninth Annual Congress on Medical Education and Licensure will be held at the Palmer House in Chicago, February 9-10, 1953. The annual Congress is conducted under the auspices of the Council on Medical Education and Hospitals of the American Medical Association and the Federation of State Medical Boards of the United States.

An open meeting of the Advisory Board for Medical Specialties will be held at the Palmer House from 9 a.m. to 12:30 p.m. on February 8.

Refer to the Annual Congress on Medical Education and Licensure when writing to the Palmer House for your reservations.

CHICAGO MEDICAL SOCIETY CLINICAL CONFERENCE

March 3, 1953, will be the opening day of the Ninth Annual Clinical Conference of the Chicago Medical Society. This Conference, designed to be of interest to both the specialist and the general practitioner, will be held at the Palmer House in Chicago.

Conducting the Conference will be a faculty ranging from thirty-five to forty outstanding speakers each offering a presentation relating to his specialty. Another group will give daily teaching demonstrations which includes the presentation of patients. The teaching will emphasize the actual technique to be employed in handling orthopedic, medical and pediatric problems. Besides these demonstrations each day, there will be a panel discussion at a round-table luncheon presenting topics of timely interest.

Our technical exhibitors are eager to present their latest advances in the field of medicine which will enable the doctor of today to treat his patient most effectively. The scientific exhibitors will demonstrate the handicraft and professional worthiness of leaders of the profession and they will be found to be most worthy of study.

The Chicago Medical Society sponsors this program for its members to whom no fee is charged. Those who are not members are asked to pay a fee of $5.00 when they register.

This is the time to set up your arrangements so these four days in March will permit you to come to the Palmer House and not only visit with physicians from all sections of the United States and Canada but likewise hear and see the latest developments in modern medicine.

INDUSTRIAL MEDICINE FELLOWSHIPS

The Institute of Industrial Health of the University of Cincinnati will accept applications for a limited number of Fellowships offered to qualified candidates who wish to pursue a graduate course of instruction in preparation for the practice of Industrial Medicine. Any registered physician who is a graduate of a Class A medical school and who has completed satisfactorily at least two years of training in a hospital accredited by the American Medical Association may apply for a Fellowship in the Institute of Industrial Health. (Service in the Armed Forces or private practice may be substituted for one year of training.)

The course of instruction consists of a two-year period of intensive training in Industrial Medicine, followed by one year of practical experience under adequate supervision in industry. Candidates who complete satisfactorily the course of study will be awarded the degree of Doctor of Industrial Medicine.

During the first two years, the stipends for the Fellowship vary, in accordance with the marital status of the individual, from $2,100 to $3,000. In the third year the candidate will be compensated for his service by the industry in which he is completing his training.

A one-year course, without stipend, is also offered to qualified applicants.

Requests for additional information should be addressed to the Institute of Industrial Health, College of Medicine, Eden and Bethesda, Cincinnati 19, Ohio.

MINNESOTA SOCIETY OF NEUROLOGY AND PSYCHIATRY

The Minnesota Society of Neurology and Psychiatry was held at the Town and Country Club in Sain Paul, November 11. Officers elected for the coming year were Dr. Alan Challman, Minneapolis, president; Dr. A. B. Baker, Minneapolis, vice president, and Dr. Royal C. Gray, Minneapolis, secretary-treasurer.

Dr. Joseph A. Resch spoke on "An Unusual Anomaly of the Spinal Cord," and Dr. Werner Simon on, "The Diagnosis of Brain Tumor Masked by Mental Symptoms," at the scientific program which followed the meeting.

NEW ORLEANS GRADUATE MEDICAL ASSEMBLY

The sixteenth annual meeting of The New Orleans Graduate Medical Assembly will be held March 2-5, 1952, with headquarters at the Municipal Auditorium.

Eighteen outstanding guest speakers will participate and their presentations will be of interest to both specialists and general practitioners. In addition, the program will include a symposium on "The Value of Newer Drugs," daily demonstrations of medical and surgical procedures in color television, clinico-pathological conferences, medical motion pictures, over 100 technical exhibits and three roundtable luncheons.

The Assembly has planned another interesting post-clinical tour to follow the 1953 meeting in New Orleans. On Saturday, March 7, a party composed of doctors and their families will leave New York for Europe on the great new superliner, *S. S. United States*. The itinerary includes England, France, Switzerland and Italy, and arrangements have been made for medical programs in these countries. The tour ends in Rome and the group

Schering

CORTOGEN®
ACETATE
for
CORTISONE
therapy

CORTOGEN

The name Schering has come to stand for pioneering research and leadership in steroid hormone chemistry. Now Schering adds this new important product to its steroid line—available in ample amount to meet all your cortisone needs.

Available as 25 mg. tablets, bottles of 30. For complete information write to our Medical Service Department.

Schering CORPORATION · BLOOMFIELD, N. J.

NEW ORLEANS GRADUATE MEDICAL ASSEMBLY

(Continued from Page 1152)

will return to New York on March 31 by Pan American World Airways, *President Special.*

Details of the New Orleans meeting and the post-clinical tour are available at the office of the Assembly, Room 103, 1430 Tulane Avenue, New Orleans 12, Louisiana.

PAN-PACIFIC SURGICAL CONGRESS

The executive office of the Pan-Pacific Surgical Association announces that the Sixth Pan-Pacific Surgical Congress will be held in Honolulu in November, 1954.

Included in the scientific program will be sessions in all divisions of surgery and related fields, with papers presented by topflight surgeons from the Pacific Area countries.

For further information concerning the Sixth Congress or membership in the Association, doctors may write to the Pan-Pacific Surgical Association, Suite 7, Young Building, Honolulu, Hawaii.

POSTGRADUATE WORK IN VIENNA

The reorganization of the American Medical Society of Vienna has made possible arrangements for American doctors to take postgraduate training at the University of Vienna. In conjunction with the University of Vienna, Academy of Medicine, the Society will be able to arrange specialized postgraduate courses to fit the individual requirements of United States' doctors and those of other English-speaking countries. Tuition and other expenses will depend on the length and type of study arranged, but will generally be less than the usual charges for such studies elsewhere. Facilities should be ready by April 1, 1953. All correspondence should be directed to Dr. M. Arthur Kline, Vienna Academy of Medicine, c/o Allgemeines Krankenhaus, Direktionsgebaeude, 2. Stock, Vienna IX. Alserstrasse 4.

THE HENNEPIN COUNTY TUBERCULOSIS ASSOCIATION

The rôle of the physician in turberculosis control is the main theme of the new series of "The Constant Invader," now being broadcast Sundays at 4:15 p.m. by WCCO. Edward Arnold, stage and screen star, is the narrator.

The fifteen-minute transcribed programs, sponsored by the Hennepin County Tuberculosis Association, and produced by the National Tuberculosis Association, are based on true stories of men and women who have fought personal battles with TB.

The series, which began October 12, will continue for thirteen weeks.

CONTINUATION COURSES

A continuation course in *Pediatric Neurology* will be presented by the University of Minnesota from January 26 to 31, 1953. The course, which will be held at the Center for Continuation Study on the University campus,

ANNOUNCING

The Sixteenth Annual Meeting

of

THE NEW ORLEANS GRADUATE MEDICAL ASSEMBLY

Conference Headquarters — Municipal Auditorium

MARCH 2-5, 1953

GUEST SPEAKERS

J. Lamar Callaway, M.D., Durham, N. C.
Dermatology
A. H. Aaron, M.D., Buffalo, N. Y.
Gastroenterology
Herbert E. Schmitz, M.D., Chicago, Ill.
Gynecology
Carl V. Moore, M.D., St. Louis, Mo.
Hematology
Rudolph H. Kampmeier, M.D., Nashville, Tenn.
Internal Medicine
Henry A. Schroeder, M.D., St. Louis, Mo.
Internal Medicine
Guy L. Odom, M.D., Durham, N. C.
Neurosurgery
Andrew A. Marchetti, M.D., Washington, D. C.
Obstetrics
Harold F. Falls, M.D., Ann Arbor, Mich.
Ophthalmology

J. Vernon Luck, M.D., Los Angeles, Calif.
Orthopedic Surgery
G. Edward Tremble, M.D., Montreal, Can.
Otolaryngology
Arthur P. Stout, M.D., New York, N. Y.
Pathology
Waldo E. Nelson, M.D., Philadelphia, Pa.
Pediatrics
Edward B. D. Neuhauser, M.D., Boston, Mass.
Radiology
George Crile, Jr., M.D., Cleveland, Ohio
Surgery
Robert E. Gross, M.D., Boston, Mass.
Surgery
Charles W. Mayo, M.D., Rochester, Minn.
Surgery
Wyland F. Leadbetter, M.D., Boston, Mass.
Urology

Lectures, symposia, clinicopathologic conferences, round-table luncheons, surgical and medical procedures in color television, medical motion pictures and technical exhibits.

(All-inclusive registration fee—$20.00)

THE POSTCLINICAL TOUR TO EUROPE BY SHIP AND PLANE—ENGLAND, FRANCE, SWITZERLAND AND ITALY—MARCH 7-31

For information concerning the Assembly meeting and the tour write
Secretary, Room 103, 1430 Tulane Avenue, New Orleans 12, La.

YOU'D OPEN A PILE OF PRESENTS

from all the patients who represent the 44 uses for short-acting NEMBUTAL

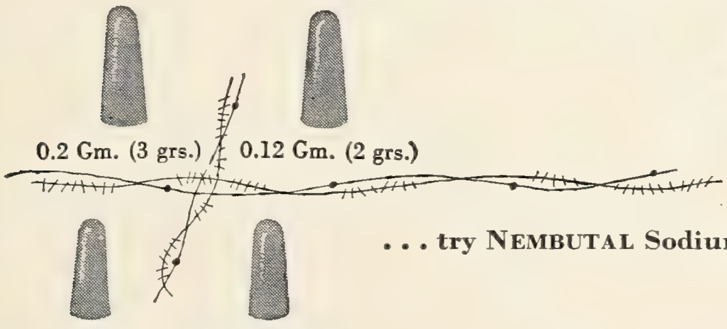
. . . at least 44 of them—for 44 uses is the clinical record for short-acting NEMBUTAL. Adjusted doses of short-acting NEMBUTAL can achieve any desired degree of cerebral depression—from mild sedation to deep hypnosis. *And with only about half the dosage of many other barbiturates.* Smaller dosage means less drug to be inactivated, shorter duration of effect, wide margin of safety, and little tendency toward cumulative effect or barbiturate hangover. Remember: In equal oral doses, no other barbiturate combines *quicker, briefer, more profound effect* than NEMBUTAL.

Abbott

Nembutal®

(Pentobarbital, Abbott)

For PROMPT SEDATION when the oral route is not feasible . . .



0.2 Gm. (3 grs.)
0.12 Gm. (2 grs.)
60 mg. (1 gr.)
30 mg. (½ gr.)

. . . try NEMBUTAL Sodium Suppositories

CONTINUATION COURSES

(Continued from 1154)

will appeal to pediatricians, neurologists, and physicians engaged in general practice. A partial list of subjects to be discussed includes the convulsive disorders, infectious neurological diseases, brain tumors in childhood, and subdural hematoma. The faculty will include Dr. Paul C. Bucy, Professor, Department of Neurology and Neurological Surgery, University of Illinois; Dr. Margaret H. D. Smith, Assistant Professor, Department of Pediatrics, Tulane University; and Dr. Douglas Buchanan, Associate Professor, Department of Pediatrics, University of Chicago. The course will be presented under the direction of Dr. Irvine McQuarrie, Professor and Head, Department of Pediatrics, and the remainder of the faculty will include clinical and full-time members of the staff of the University of Minnesota Hospitals and the Mayo Foundation.

* * *

The University of Minnesota will present a continuation course in *Ophthalmology for Specialists* at the Center for Continuation Study from January 19 to 24, 1953. Emphasis will be placed throughout the session on therapy of a variety of ocular disorders.

The visiting faculty for the course will include Dr. Kenneth C. Swan, Professor and Head, Department of Ophthalmology, University of Oregon Medical School, Portland. The course will be presented under the direction of Dr. Erling W. Hansen, Professor and Director, Division of Ophthalmology, and the remainder of the faculty will include members of the staff of the University of Minnesota Medical School and the Mayo Foundation.

Cook County Graduate School of Medicine

POSTGRADUATE COURSES—Winter 1952-53

SURGERY—Intensive Course in Surgical Technic, two weeks, starting January 19, February 2, February 16
  Surgical Technic, Surgical Anatomy & Clinical Surgery, four weeks, starting March 2
  Surgical Anatomy & Clinical Surgery, two weeks, starting March 16
  Basic Principles in General Surgery, two weeks, starting March 23
  Gallbladder Surgery, ten hours, starting April 20
  Surgery of Colon and Rectum, one week, starting March 2
  General Surgery, one week, starting February 9
  General Surgery, two weeks, starting April 20
  Fractures and Traumatic Surgery, two weeks, starting March 2
GYNECOLOGY—Intensive Course, two weeks, starting February 16
  Vaginal Approach to Pelvic Surgery, one week, starting March 2
OBSTETRICS—Intensive Course, two weeks, starting March 2
PEDIATRICS—Intensive Course, two weeks, starting April 6
MEDICINE—Intensive General Course, two weeks, starting May 4
  Electrocardiography & Heart Disease, two weeks, starting March 16
  Allergy, one month and six months, by appointment
UROLOGY—Intensive Course, two weeks, starting April 13
  Ten-Day Practical Course in Cystoscopy starting every two weeks
DERMATOLOGY—Intensive Course, two weeks, starting May 4

TEACHING FACULTY—ATTENDING STAFF OF COOK COUNTY HOSPITAL

ADDRESS: REGISTRAR, 707 South Wood Street
Chicago 12, Illinois

* * *

A continuation course in *Clinical Chemistry for Physicians* will be presented by the University of Minnesota next February 2-4. The two-and-a-half-day session, which will be held in the Center for Continuation Study and the University of Minnesota Hospitals Laboratories, has been designed to help the physician in setting up and supervising laboratory procedures in his own office or local hospital. Attendance will be strictly limited, and instruction will consist principally of actual experience at the Laboratory benches. Dr. Gerald T. Evans, Director of Hospital Laboratories, and Professor, Department of Medicine, will be in charge of instruction.

* * *

Minnesota physicians met at the University of Minnesota's Center for Continuation Study Thursday (Nov. 13) for a three-day meeting on *Fractures and Surgery of Trauma.*

Evaluation of injuries from the medico-legal standpoint and a symposium on the seriously injured patient were special features of the program. Two visiting lecturers spoke at the sessions—Dr. Carroll B. Larson, chief of service, department of orthopedic surgery, State University of Iowa, Iowa City, and Dr. Edward L. Compere, professor of bone and joint surgery, Northwestern University Medical School, Chicago.

The course was under the direction of Dr. Owen H. Wangensteen, chairman of the University's surgery department, and Dr. Wallace H. Cole, professor and director of the division of orthopedic surgery. Some of the discussions will be led by members of the University medical school faculty.

PAMPHLETS ON MULTIPLE SCLEROSIS PROBLEMS AVAILABLE

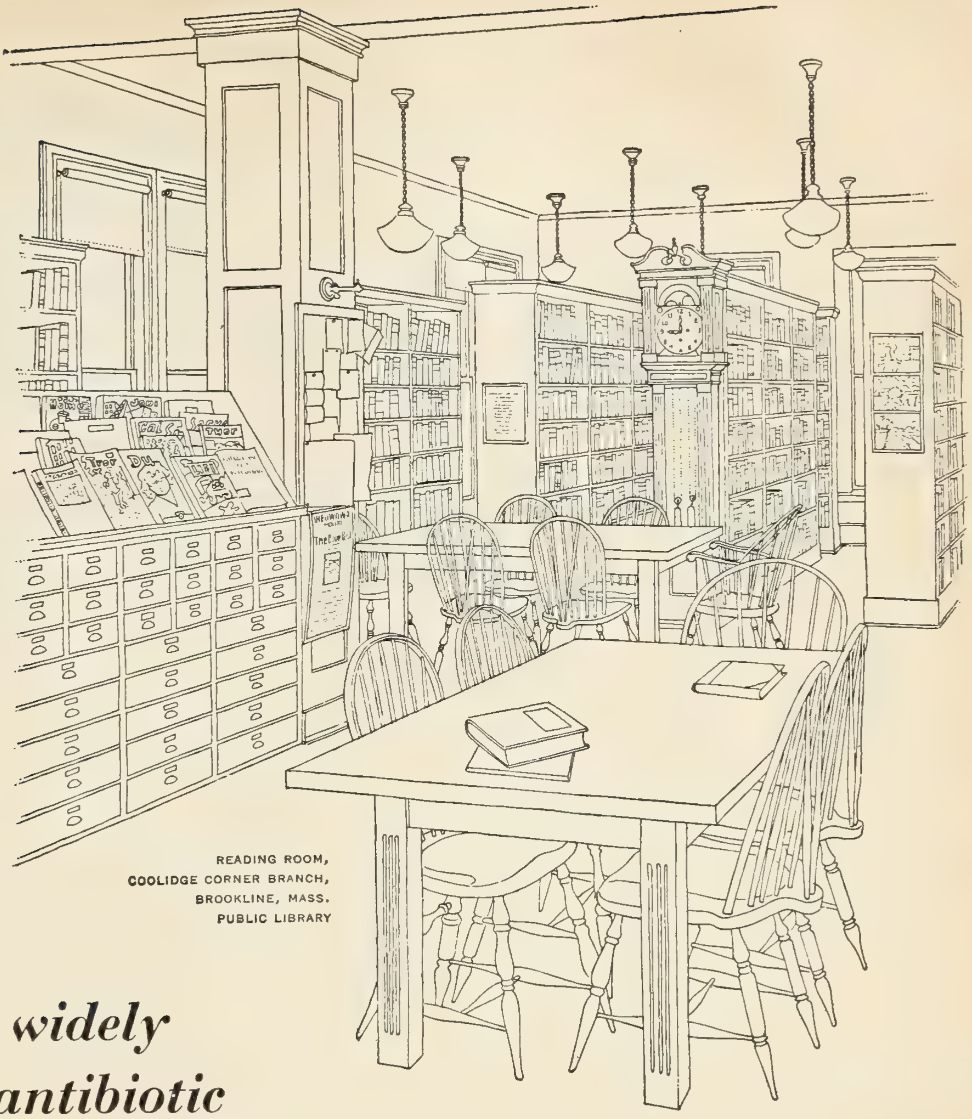
The National Multiple Sclerosis Society has announced that a series of pamphlets dealing with the problems of physical medicine and rehabilitation in multiple sclerosis is available at no cost to physicians who wish to have them. The four pamphlets are directed for the care of independent ambulatory patients, those requiring canes or crutches, wheel chair patients and bed patients. Physiotherapy has more to offer these patients than any known drugs.

MEDICAL MOTION PICTURES

The Committee on Medical Motion Pictures has announced the publication of a new revised film list which includes seventy-eight medical films not readily available from other sources.

This list will be available for distribution after December 1, 1952. A copy may be obtained by writing the Committee on Medical Motion Pictures, American Medical Association, 535 North Dearborn Street, Chicago 10.

New aureomycin
minimal dosage for adults
—four 250 mg.
capsules daily, with milk.



READING ROOM,
COOLIDGE CORNER BRANCH,
BROOKLINE, MASS.
PUBLIC LIBRARY

a most widely accepted antibiotic in the broad-spectrum field is

AUREOMYCIN

Hydrochloride Crystalline

because

Physicians in the United States and throughout the world have recognized the time-saving value of immediate use of aureomycin in cases of active infection.

The successful use of aureomycin, as described in publications by physicians throughout the world, has increasingly encouraged others to use this antibiotic and publish reports thereon. To date, more than 7,000 original reports, editorials, brief comments, and similar notations have appeared in the published literature.

The trend of the literature clearly indicates that in desperate situations caused by infection, where previously cure would have proved difficult or impossible, aureomycin has saved the day.

Woman's Auxiliary

RAMSEY AUXILIARY BEGINS FALL WORK

Mrs. Wallace P. Ritchie

The members of the Ramsey County Medical Auxiliary have assumed many responsibilities for projects during the year.

On Friday, October 24, they staffed a booth devoted to poliomyelitis at the Minnesota Education Association convention in Saint Paul. The delegates showed a great deal of interest in the part that schools can plan in stamping out polio.

On Monday, October 27, members were shown an American Medical Association film, "Here's Health—the American Way," dealing with the problems of doctors in both rural and urban centers.

On November 5, the Auxiliary worked at the Christmas Seal headquarters stuffing envelopes for the annual sale of Christmas seals, and on the same day helped with the registration of Saint Paul women for Civilian Defense at two meetings of the Women's Institute.

SCHOOL OF INSTRUCTION WELL ATTENDED

Mrs. Leonard Arling

Last October 10, some 100 women from all over the state gathered at the Hotel Saint Paul to attend a School of Instruction meeting on how to improve the relations of local medical auxiliaries with other organizations and individuals in the state.

After a short Board meeting, a Public Relations Panel, handled by experts in their own field, told Auxiliary members exactly where the doctor and his wife fall down in this extremely important aspect of their life.

The use of exhibits as an Auxiliary tool in public relations was discussed by Wallace Fulton, Acting Director, Division of Public Health Education, Minnesota Department of Health, who presented a few rules:

1. Get across one main idea. Brevity is important. Get kernel of the idea across in a few words.
2. The idea must get across in forty to seventy seconds, the length of time the average exhibit viewer looks at an exhibit.
3. Your exhibit must pertain to problems in your district. Use an art teacher, a store window dresser, or a manual training teacher to help plan and make it up.
4. Color, lighting, motion are necessary to a good exhibit.

The press side of the story was told by Victor Cohn, science writer for the *Minneapolis Tribune,* who said, "Tell your story accurately, simply. Local doctors should act as spokesmen, experts in the field for local medical problems. Present the health problems. Don't try just to get names in. The public is not interested in what you say, but in what you do."

Jim Borman, News Director for WCCO, told auxiliary members that both newsmen and doctors' wives must be patient and long-suffering. He felt that the doctor's wife must gossip less than most women, because she seems worried and tired. She must be broadminded, never jealous. However, he felt, doctors' wives seem to strive socially too much, and not enough in their community for humble, civic duties. They should emulate their husbands who give unceasingly of their time and strength for others. Their wives should have a stronger sense of civic responsibilities.

Mrs. Lewis Minion, Home and Community Director of the Minnesota Farm Bureau Federation, represented other organizations on the panel. She noted, "We are not political, but show what the common people can do working for health without government help and interference. We are definite, violent opponents of any type of socialized medicine. We are pioneers in Blue Cross and Blue Shield. We promote practical nursing. . . ."

The luncheon speaker was Senator Edward J. Thye, who spoke on the need of the world for a great diplomat as United States president. He stated that for what the boys win by their blood on the battlefield America repeatedly loses by blunders at the diplomatic conference table. The United States must have the confidence of the world, he said, that it does know where it is going, or America will lose the world leadership, which will fall into Russia's waiting hands.

Mrs. James McDonnough, Chicago, fourth vice president of the Woman's Auxiliary to the American Medical Association, spoke on membership. She stated, "We want 5,000 new members this year. Coming together, beginning, planning together, making progress, working together is success. Our 60,000 national members must work and fight together; every woman should have a specific job to make her work, and gain her friends. As Emerson said, 'Nothing was ever achieved without enthusiasm.'"

Mrs. Harold F. Wahlquist, past president of the Woman's Auxiliary to the American Medical Association, reported on the Minnesota Public Health Conference. She felt that it is up to the Auxiliary to see a health need, emphasize it, until lay people see it, grab it and carry on with it. There are nearly 12 million people over sixty-five years of age in Minnesota—more than in California or Florida. Minnesota is now an urban state, not rural. The Auxiliary should work so that local levels solve their own problems. It is important that old people be made self-sufficient and independent.

Following this, round tables on eight aspects of Auxiliary work were held.

WHEN DIETARY SUPPLEMENTATION IS NEEDED...

what more could a supplement provide?

If the concept of an ideal dietary supplement could be formulated, it might well be one that provides qualitatively every substance of moment in human nutrition. It would provide those for which human daily needs are established as well as others which are considered of value, though their roles and quantitative requirements remain unknown.

How Ovaltine in milk approaches this concept, and how well the recommended three glassfuls daily augment the nutritional intake, is shown in the appended table. The two forms of Ovaltine available—plain and chocolate flavored—are closely alike in their nutrient values.

THE WANDER COMPANY, 360 N. MICHIGAN AVE., CHICAGO 1, ILL.

Ovaltine

Three Servings of Ovaltine in Milk Recommended for Daily Use Provide the Following Amounts of Nutrients

(Each serving made of ½ oz. of Ovaltine and 8 fl. oz. of whole milk)

In Memoriam

JOHN S. GROGAN

Dr. John S. Grogan, since 1925 a practitioner at Wadena, Minnesota, died October 21, 1952, of a heart attack. He was seventy-two years of age.

Dr. Grogan was born at Streator, Illinois, September 24, 1880. He graduated from Knox College with a B.S. degree in 1904 and was prominent in undergraduate baseball and football activities. A fifty-five-yard drop kick for a goal against the University of Illinois should he recorded. He gave up a successful coaching career at Fargo and the University of Idaho to begin the study of medicine at Northwestern University at the age of twenty-nine. He graduated in 1914.

After interning at the Kenmore, North Dakota, hospital he practiced in this town a year and in Flaxton, North Dakota, from 1915 to 1925 before joining the Wadena Clinic in 1925. Dr. Grogan left the clinic in 1948 but joined the Red Cross Mobile unit during the summer of 1951, travelling throughout Minnesota.

He was a member of Phi Beta Pi and Nu Sigma Nu fraternities and the Rotary Club of Wadena. He had served on the Wadena School Board from 1933 to 1951 and was also a member of the Fair Oakes Sanatorium Board.

He was a member of the Upper Mississippi Valley Medical Society, the Minnesota State Medical Association and the American Medical Association.

Dr. Grogan married Magna Melby of Kenmore, North Dakota, who with two daughters and a son, Dr. John M. Grogan of Denver, survives him.

ELMER F. LUNDQUIST

Dr. Elmer F. Lundquist, a practitioner in Minneapolis since 1924, died October 19, 1952. He was fifty-nine years of age.

Dr. Lundquist was born in Minneapolis, November 29, 1892. He attended Central High School and the University of Minnesota, where he obtained a B.S. degree in 1914 and an M.D. degree in 1918. He interned at the U.S. Naval Hospital at Great Lakes from 1919 to 1924, when he returned to Minneapolis.

He was a member of the Alpha Kappa Kappa medical fraternity and attended Westminster Presbyterian Church. He was also a member of the Hennepin County Medical Society, the Minnesota State Medical Association and the American Medical Association. At one time he served as chief of staff of Swedish Hospital.

Dr. Lundquist is survived by his wife and a son, Dr. James A. Lundquist, now living in Alaska.

Communication

Fort Snelling, Minnesota
20 October, 1952

To the Editor:

The item headed "Medical Services for Military Personnel" on page 976 of your October, 1952, issue was read with interest and makes a fine contribution in assisting local civilian physicians and hospitals in obtaining compensation for services rendered to active duty military personnel.

The basic premises of the item are well founded and apply to military personnel of the Air Force as well as those of the Army. However, the item as published conveys the erroneous impression that the Chief of the Minnesota Military District is responsible for military personnel of all three Military Departments in this regard.

In order to correct this erroneous impression and to aid your physician and hospital readers in obtaining prompt payment of fees for services rendered to active duty Air Force personnel, the following procedures are recommended:

(a) Upon identifying the patient as an active duty member of the Air Force notify the Commanding Officer of the nearest Air Force Station by collect telephone or telegram or by letter, giving the patient's name, rank, service number, the designation and post office address of the unit to which he is assigned, the diagnosis and the immediate prognosis. Include in your message a request that you be furnished written authority to continue the emergency treatment and instructions as to the ultimate disposition of the patient.

(b) Physicians and hospitals located in areas where there is no closer Air Force Station in Minnesota, the western half of Wisconsin, north Central Iowa, Eastern South Dakota, and North Dakota may address their written communications to the nearest listed below:

Commanding Officer, 72nd Air Base Squadron, Fort Snelling, Saint Paul 11, Minnesota.

Commanding Officer, 73rd Air Base Squadron, Williamson-Johnson, Municipal Airport, Duluth, Minnesota.

Commanding Officer, 78th Air Base Squadron, Truax Field, Madison, Wisconsin.

Commanding Officer, 79th Air Base Squadron, Sioux City Municipal Airport, Sioux City, Iowa.

(c) Telephone calls should be routed to the Surgeon at each of the above addresses.

Upon request, this office will furnish further information to assist any physician, dentist, pharmacist or hospital in this area to obtain prompt payment for services rendered to active duty Air Force personnel.

◆ Of General Interest ◆

Dr. Winchell McKendree Craig, professor of neurosurgery in the Mayo Foundation at Rochester, Minnesota, was installed president of the Association of Military Surgeons of the United States at its annual meeting on November 19. He succeeds Major General Harry G. Armstrong, Surgeon General of the United States Air Force. Dr. Craig, a Rear Admiral in the United States Naval Reserve, was born in Washington Court House, Ohio, graduated from Culver Military Academy and Ohio Wesleyan University and received his medical degree from Johns Hopkins in 1919. He entered active duty with the Navy as Rear Admiral and was Chief of Surgery at Corona Naval Hospital, California, and at the National Naval Medical Center at Bethesda, Maryland.

* * *

Dr. Walter C. Alvarez of Chicago, formerly a gastroenterologist and teacher at the Mayo Foundation, University of Minnesota, has been honored as recipient of the first Honor Award to be given by the American Medical Writer's Association. The award, consisting of a gold medal and certificate, was presented to Dr. Alvarez at the dinner on the occasion of the 9th annual meeting of the Association at the Jefferson Hotel, St. Louis, Missouri, October 1, 1952. Dr. Alvarez is Editor-in-Chief of *Modern Medicine* and professional lecturer at the University of Illinois College of Medicine.

* * *

Dr. Stephen E. Kramer, staff member at Anoka State Hospital, left October 6, to practice psychiatry on the staff of the hospital at Crownsville, Maryland.

* * *

Dr. John Towey, medical director of Pinecrest Sanatorium, Powers, Michigan, formerly of Stillwater, was awarded the Dearholt medal for outstanding achievement in turberculosis work.

The award was presented at the Mississippi Valley Conference on Tuberculosis at St. Louis, Missouri. Presenting the award was a former Minnesotan, **Dr. John H. Skavlem,** Cincinnati, Ohio.

Minneapolis was selected for the October, 1953, conference.

* * *

At the annual meeting of the American Society of Plastic and Reconstructive Surgery held in New York in September, **Dr. Merrill D. Chesler,** Minneapolis, was admitted as a candidate member.

* * *

Dr. M. M. Williams has been recently appointed superintendent of the Minnesota State Sanatorium at Ah-Gwah-Ching.

* * *

Financial support for at least one more year was voted for the Minnesota Cancer Detection Center, October 14. The board of directors of the American Cancer Society's Minnesota Division voted to grant $20,000 and agreed, in principle to "continue the entire program for three years subject to budget limitations."

* * *

Dr. C. G. Uhley, Crookston, was re-elected the group's president and **Dr. David P. Anderson, Jr.,** Austin, was named second vice president.

* * *

Three new consultants—**Dr. James K. Masson, Dr. Kenneth A. Huizenga** and **Dr. Robert T. Patrick**—were named to the Mayo Clinic staff at the beginning of fall quarter.

Dr. Gaylord W. Anderson, director, School of Public Health, University of Minnesota, addressed the North Dakota Public Health Association convention, October 11, held at Grand Forks, North Dakota.

* * *

Dr. Robert B. Pierce, Renville, spoke on the effect of poliomyelitis on the local community, October 6, to the Ladies Auxiliary Unit of the Renville County Hospital Association, who were guests of the Bird Island Unit for the meeting.

* * *

Dr. Kristopher Hagen, who returned in June from serving with the Santal Mission in India, and is now practicing in Cokato, was a guest speaker at the First Lutheran Church at Columbia Heights, October 12.

* * *

After almost three months of touring seven European countries, **Dr.** and **Mrs. O. J. Seifert,** returned to New Ulm in October.

* * *

Dr. Gordon B. New, retired chief of plastic surgery at the Mayo Clinic, was awarded a silver plaque, September 30 in honor of his contribution to the field of plastic surgery, at a meeting of the American Society of Plastic and Reconstructive Surgery in New York.

* * *

Dr. S. F. Ceplecha, Redwood Falls, was the main speaker at the monthly meeting of the Renville-Redwood Medical Society held October 8.

* * *

Dr. O. A. Wisness, Confrey, received his student pilot's license in October. Dr. Wisness made his first solo flight after eleven hours of flying time.

* * *

New president of the Wabasha County Medical Society is **Dr. E. C. Bayley,** Lake City. Dr. Bayley succeeds **Dr. Doreen Martin,** Pepin, formerly of Wabasha. Other officers named at the meeting were **Dr. C. G. Ochsner,** Wabasha, vice president and **Dr. W. F. Wilson,** Lake City, secretary-treasurer.

"Next Year"

Do you realize that municipal bonds will give you security without further thought on your part, leaving your mind free for professional interests while your municipal investments are constantly working for you?

Perhaps professional people more than any other group know the wisdom of planning for the future.

Many of them already appreciate the inherent security and "Tax-exempt" privileges obtained by the municipal bond investor.

Many of them are already purchasing municipal bonds, putting aside some income each year in security for the future.

If you have already determined to "eventually" acquire municipal bonds may we suggest that you write or call us NOW for descriptive circulars.

"NEXT YEAR" Is Once Again 365 Days Away.

JURAN & MOODY **MM122**
93 E. Sixth St.
St. Paul 1, Minn.

Dr. W. E. Archer joined the psychiatric staff of the Anoka State Hospital, October 1. Dr. Archer was graduated from Marquette University in 1926; he later did postgraduate work in neurology and psychiatry at the Veterans Administration Hospital at Hines, Illinois, and has recently been in practice at Dale, Wisconsin.

* * *

Dr. H. L. Smith was retired from the staff of the Mayo Clinic in September and is now enjoying what he says is the first opportunity to do a number of things which lack of time have never permitted him to do.

Dr. Smith has been successively a consultant in internal medicine; professor of medicine in the Mayo Foundation, graduate school, University of Minnesota; head of a section of medicine in the Mayo Clinic and senior consultant in the division of medicine.

* * *

Dr. Elmer Martinson, Wayzata, became a Fellow in the American College of Surgeons, September 26, at the meeting in New York.

* * *

Dr. William S. Terry, Minneapolis, was inducted into the navy and assigned to the Portsmouth Naval Hospital, Portsmouth, Virginia, in October.

* * *

New clinic quarters for **Drs. David O. Berge** and **Gilbert S. Wheeler** were recently finished in Roseau.

Dr. A. Mahowald, who has been serving the community for more than thirty years, left Albany, November 1, to accept a position at the State Hospital in Fergus Falls. Businessmen and social organizations honored Dr. Mahwold at a banquet October 23.

* * *

Dr. Arthur Collins, after four years of service at the State Hospital at Moose Lake, left in October to begin private practice in Duluth. His offices are in the Medical Arts Building.

* * *

Dr. Hugh A. Johnson and family left Rochester, October 15, for a nine-month trip abroad. The Johnsons plan to remain in England until after the coronation.

* * *

An orthopedic clinic sponsored by the crippled children services of the State Division of Social Welfare was held at Little Falls, November 1. There will be only six clinics this fall, instead of the usual ten of the fall series because of the shortage of public health nurses.

Dr. F. F. Callahan, chief of the medical services, State Division of Social Welfare, reminds physicians that any child, to be examined at any of the field clinics, must have a referral from his family physician.

* * *

Dr. John G. Rukavina became a member of the medical staff of the Mesabi Clinic at Hibbings, in October. Dr. Rukavina is a graduate of the University of Minnesota and has been certified as a specialist in Internal Medicine. He formerly practiced in Saint Paul.

* * *

Drs. R. G. Bickford, E. C. Clark and **David Daly** of the Mayo Clinic staff, attended and presented papers at a meeting of the Central Electroencephalographers Society in Madison, Wisconsin, October 18-19.

* * *

State hospital appointments of October 16, named **Dr. John Reitmann,** permanent superintendent of Anoka State Hospital and **Dr. Kenneth Douglas,** permanent superintendent of Sandstone State Hospital. Dr. Reitmann had been serving as superintendent of both the Sandstone and the Anoka Hospitals for three months.

Dr. Reitmann received his medical degree from the University of Minnesota. From 1945 to 1947, he served in the Army Medical Corp, spending nine months of this time in Germany working on an army discharge screening board. Following his army discharge, Dr. Reitmann was a psychiatrist at Hastings State Hospital until he became acting superintendent at Sandstone State Hospital in July of 1950.

Dr. Douglas, formerly clinical director at the Willmar State Hospital, received his medical degree from the University of Minnesota. From 1940 to 1949, he was in private practice at Tacoma, Washington, and in 1949, St. Peter. During 1950, and until he was appointed clinical director, Dr. Douglas was on the staff at the Willmar State Hospital.

The Birches Sanitarium, Inc.

2391 Woodland Avenue
Duluth 3, Minnesota

A hospital for the care and treatment of Nervous and Mental disorders. Quiet, cheerful environment. Specially trained personnel. Recreational and occupational therapy.

Dr. W. C. Kaufman was honored by the Appleton Saddle Club, October 10, at a Horse "Show-Deo." Recently Dr. Kaufman sold the old hospital he built nearly forty-five years ago to the village and thus paved the way for construction of the new hospital which was completed and opened last year. Proceeds from the show will be used to provide accessories for the new community hospital.

* * *

A special homecoming program, arranged for physicians by the University of Minnesota and the Minnesota Medical Alumni Association, was held at the University October 30-November 1.

A course in medical economics was presented October 30 and 31. **Dr. Charles G. Sheppard,** Hutchinson, speaker of the House of Delegates of the Minnesota State Medical Association, spoke on the medical school in relation to medical practice in the state, October 31. A part of the program featured **Dr. James R. Fox,** recently returned from a three-month visit to Great Britain where he was a practicing physician, in a special lecture on "Inside the British Health Plan."

Various clinics presenting patients with surgical, medical, pediatric, gynecological and dermatologic disorders were held.

* * *

Dr. Albert John Schroeder, Minneapolis, was elected to fellowship in the American Academy of Pediatrics in November.

Dr. Elizabeth Leggett resigned her position on the medical staff at the state sanatorium, Ah-Gwah-Ching, October 1. Dr. Leggett will devote her time to clinics at the Indian Hospitals at Cass Lake, Red Lake and White Earth. Her main office is in Cass Lake.

* * *

Several Mayo Clinic staff members attended meetings throughout the country recently.

Dr. K. W. Bruce attended a meeting of the American Academy of Oral Pathology at Washington, D. C., and participated in a mid-year symposium on bone tumors and diseases, October 18.

Dr. L. C. Kolb attended a meeting on psychiatry with the Ad Hoc Committee on Stress and a meeting of the Division of Medical Sciences of the National Research council in Washington, D. C., October 18.

Dr. E. T. Leddy was at a meeting of the American Cancer Society, October 20-21.

Drs. G. B. Logan and **S. D. Mills** attended a meeting of the American Academy of Pediatrics in Chicago, the week of October 19.

* * *

In connection with his work with the Minnesota Mental Health research laboratory at Hastings, **Dr. Henry Vai Meier,** Stillwater, recently spent several days visiting the research laboratories of the M. D. Anderson Cancer Station at Houston, Texas.

Dr. A. I. Balmer addressed the Pipestone Parent Teachers Association, October 14, on the 1952 polio outbreak in Minnesota.

* * *

Dr. M. Duane Sommerness, former North Dakota State psychiatrist, and **Dr. Frithjoe Sorum,** private practitioner at Jasper, joined the staff of the Willmar State Hospital in November. Two other medical workers to join the staff in November also were Ole T. Omlid as the chief psychiatric social worker and Curtis W. Page, a clinical psychologist.

* * *

Open house was held in the new doctors building in Lyle where **Dr. Conrad B. Frydenlund,** of Hayward began practice in his local community, October 25.

* * *

Dr. C. W. Mayo, Rochester, was one of eighteen Minnesotans appointed to national American Legion commissions, committees and boards for the coming year. Dr. Mayo's appointment as assistant chief medical advisor to the rehabilitation medical advisory board was announced October 22.

* * *

Dr. Mary C. Ghostley, superintendent of Lake Julia Sanatorium at Puposkey for nineteen years, will retire in 1953 and the sanatorium will be sold or used for other purposes.

* * *

Dr. Sumner S. Cohen, assistant medical director at Glen Lake Sanatorium, spoke on the changing age trend of tuberculosis, at the Thirty-fifth Annual meeting of the American Dietetic Association in Minneapolis, October 21-24.

* * *

Dr. Stanley V. Lofsness, consultant pathologist of St. Lucas Deaconess Hospital, Faribault, addressed an open meeting of the Hospital Auxiliary Assembly October 22, on the work of the pathologist, especially in reference to cancer.

* * *

Helping the city to celebrate its "Health Days," **Dr. C. E. Carlson** of the Alexandria Clinic addressed the Parent Teachers Association on heart diseases, October 20.

Members of the professional staffs of the Mayo Clinic and the Rochester State Hospital who participated in the meeting of the American Dietetic Association, held in Minneapolis, October 21-24, were: **Drs. J. A. Bargen** and **Clifford F. Gastineau,** Mayo Clinic; John S. Pearson, clinical psychologist at the Rochester State Hospital, and Sister Mary Victor, director of the department of nutrition at Saint Mary's Hospital.

More than 175 members of the Association met for "Rochester Day" at Rochester, October 25, following the Minneapolis meeting. During the program **Dr. Donald C. Balfour,** director emeritus of the Mayo Foundation for Medical Education and Research, spoke on the medical center of Rochester; interested persons attended tours of the Mayo Clinic and associated institutions which contribute to the care of patients; for dietitians who served their internship at Saint Mary's Hospital, an alumni dinner was served at the hospital.

* * *

Guest speakers at the pathological conferences on cancer and heart diseases held at Saint Lukes Hospital in Alexandria were **Dr. Arthur C. Kerkhof,** Clinical Associate Professor, Department of Medicine, University of Minnesota, October 20, and **Dr. Ivan Baronofsky,** Associate Professor of Medicine at the University, November 11.

* * *

Dr. James M. A. Weiss, formerly of Minneapolis, recently completed a one-week appointment as Consultant in Psychiatry to the New York State Mental Health Commission, in Syracuse, New York. Dr. Weiss served as supervising interviewer and took part in the analysis of research data gathered in a mass survey project, designed by Dr. Ernest M. Gruenberg, Executive Director of the Commission, to determine the prevalence of mental illness in the older population groups.

Dr. Weiss was graduated from the University of Minnesota and its Medical School. Formerly Teaching Assistant in Psychology at St. Thomas College, he has served as Assistant Surgeon (R) in the U. S. Public Health Service, and as Fellow of the National Institute of Mental Health in Psychiatry and Public Health at Yale University. He now holds an ap-

ANNUAL CLINICAL CONFERENCE

CHICAGO MEDICAL SOCIETY

March 3, 4, 5, 6, 1953 • Palmer House, Chicago

THIRTY-FOUR HALF-HOUR LECTURES BY OUTSTANDING TEACHERS AND SPEAKERS on subjects of interest to both general practitioner and specialist.

FOUR PANELS ON TIMELY TOPICS.

DAILY TEACHING DEMONSTRATIONS.

SCIENTIFIC EXHIBITS worthy of real study and helpful and time-saving TECHNICAL EXHIBITS.

The CHICAGO MEDICAL SOCIETY ANNUAL CLINICAL CONFERENCE should be a MUST on the calendar of every physician. Plan now to attend and make your reservation at the Palmer House.

pointment as Senior Resident in Neuropsychiatry, under the U.S.V.A.-Yale University Training Program, at New Haven Hospital.

* * *

Dr. Inman A. Helsa joined the Austin Clinic in October. Dr. Helsa was graduated from Southwestern Medical College, Dallas, Texas, in 1950, and recently completed his internship at Charles T. Miller Hospital, Saint Paul.

* * *

Dr. Walter B. Wells, Jackson, was elected president of the Southwestern Minnesota Medical Society at the annual meeting held at the Country Club in Pipestone, October 27. Other officers named were **Dr. L. J. Hoyer,** Windom, president-elect; **Dr. A. I. Balmer,** Pipestone, vice president, and **Dr. O. M. Heiberg,** Worthington, secretary. **Drs. B. M. Stevenson,** Fulda, and **Dr. E. W. Arnold,** Adrian, were named to the office of censors.

Dr. E. D. Henderson, Mayo Clinic, spoke on the treatment of Oster-Arthritis.

* * *

Four "Top Flight GP's" were named at the annual refresher course of the Minnesota Academy of General Practice, held at the Radisson Hotel, Minneapolis, October 29. The doctors thus honored were **Dr. Roger G. Hassett,** Mankato; **Dr. Albert E. Ritt,** Saint Paul; **Dr. Aaron Friedell,** Minneapolis; and **Dr. Willis L. Herbert,** Minneapolis.

The citations were made "on the basis of the quality of their work, the esteem of their colleagues and their work for the academy," **Dr. James A. Blake,** Hopkins, president, said

Speakers at the course included: Dr. Philip Thorek and Dr. Philip Lewin of Chicago; Dr. A. C. Corcoran, Cleveland; **Dr. E. V. Allen,** Rochester; and **Drs. Cecil Watson, E. T. Bell** and **Raymond Bieter** of the University of Minnesota.

* * *

Dr. and **Mrs. Theodore H. Sweetser,** Minneapolis, have a new son, Paul Anthony, born October 11.

* * *

Dr. William Bernard Halme, Brainerd, was inducted into the army, November 28.

* * *

The Minnesota Society of Internal Medicine held its annual fall meeting at Rochester, October 27. Physicians who gave papers were: **Drs. L. O. Underdahl, Talbert Cooper, J. M. Stickney, G. L. Pease,** R. G. Tompkins, D. C. Connolly, **E. H. Wood, H. B. Burchell, J. W. Kirklin, Thomas W. Parkin, Ian E. Rusted, Jesse E. Edwards, M. H. Stauffer, R. M. Salassa, J. C. Cain,** S. Y. Jordan, **M. W. Comfort, H. K. Gray** and **W. F. Kvale.**

* * *

Dr. Donald C. Balfour, emeritus director of the Mayo Foundation, spoke on "Medical Eras," to the twelfth annual dinner meeting of the Olmstead County Historical Society, October 21.

Dr. Roger L. J. Kennedy, Mayo Clinic pediatrician, was elected vice president of the American Academy of Pediatrics at the twenty-first annual meeting of the academy in Chicago, October 23.

* * *

Dr. George E. Moore, associate professor at the University of Minnesota Medical School, was named director and chief of surgery at the Roswell Park Memorial Institute at Buffalo, New York, in November.

The Roswell Institute, a cancer hospital and research center, is affiliated with the University of Buffalo Medical School where **Dr. John Paine,** former University of Minnesota surgeon, is surgery chief.

* * *

Dr. W. G. Workman spoke to the members of the Tracy Kiwanis Club October 16, on the county-wide tuberculosis testing program.

* * *

Dr. Paul F. Brabec, Detroit Lakes, located in Bagley November 1. Dr. Brabec is a native Minnesotan, born at Perham. He was graduated from Iowa State University Medical School and completed his internship at Saint Mary's Hospital, Minneapolis. He has done graduate work in surgery at Rochester in addition to serving in the army during World War II and practicing with his father in Perham.

In 1948 the Arthritis and Rheumatism Foundation was formed. This is a voluntary organization to raise funds for medical research and education on a nationwide scale. In 1950, Congress authorized and the Surgeon General of the Public Health Service established, the National Foundation of Arthritis and Metabolic Diseases, primarily to conduct research and to make grants to nonfederal institutions throughout the country. The two foundations cooperate under the leadership of **Dr. Gideon K. de Forest,** Medical Director of The Arthritis and Rheumatism Foundation and **Dr. Russell M. Wilder,** Director of The National Institute of Arthritis and Metabolic Diseases.

* * *

Dr. Philip S. Hench of Rochester, Minnesota, was the recipient of the Mississippi Valley Medical Society's Honor Award for 1952. The award, consisting of a gold medal and a certificate, was presented Dr. Hench at the banquet on the occasion of the 17th annual meeting of the society at the Jefferson Hotel, St. Louis, Missouri, October 2, 1952.

* * *

The **National Foundation for Infantile Paralysis** is offering a limited number of fellowships in the field of public health and preventive medicine. The purposes of these fellowships are to prepare physicians to fill the many vacancies existing in public health and preventive medicine. They are for one or more years at an approved school of public health and will be financed by March of Dimes funds. A medical degree, a year's internship and a United States citizenship are requisites for candidates. Complete information may be obtained from the Division of Professional Education, The National Foundation for Infantile Paralysis, 120 Broadway, New York 5, New York.

* * *

Yellow fever vaccine, formerly made only by the Public Health Service, will be manufactured in the future by the National Drug Company of Philadelphia. Withdrawal of the government from yellow fever vaccine production is in accord with Public Health Service policy of turning over to the pharmaceutical industry the manufacture of biological products once large scale production becomes feasible. The status of clinics designated to issue yellow fever vaccine certificates is not changed and vaccination certificates must be obtained by travelers from designated clinics. The vaccine has formerly been manufactured at the Rocky Mountain Laboratory at Hamilton, Montana, a division of the National Institutes of Health.

* * *

Dr. Warren F. Wilhelm, formerly of the Mayo Clinic, has been appointed Medical Director of Research Clinic in Kansas City, Missouri. The clinic is chiefly a diagnostic clinic and devotes all of its efforts to clinical medicine.

* * *

Open house, to be held November 9, at the Belview Medical Center, honoring a new doctor—**Dr. John Strauchler**—and opening of the new building, was delayed because of illness of the doctor. Two days before the scheduled open house Dr. Strauchler was admittd to Abbott Hospital where he had an emergency operation for appendicitis.

Dr. Strauchler, Austria, was graduated from the University of Zurich Medical School in Switzerland in 1935. He was in private practice and on the staff of a Veterans Hospital in Canada for several years before coming to Minnesota. He recently completed a year of internship at Abbott Hospital, Minneapolis.

* * *

Dr. L. H. Heinz and **Dr. I. B. Heinz,** moved into new clinic quarters in the Hergott building in Shakopee, November 1.

* * *

Dr. Grant L. Griebie joined **Dr. A. M. Jensen** in the Brownton Clinic at Brownton in November.

Dr. Griebie, who recently served twenty-one months in the army in the United States and Germany, was born and grew up in Brownton. He attended St. Olaf College in Northfield; received his medical degree from Northwestern University, Chicago, and interned at Cook County Hospital in Chicago.

Before he joined Dr. Jensen, Dr. Griebie was in practice with **Dr. J. D. Selmo** at Northwood.

* * *

Dr. V. G. Coseriu, Youngstown, Ohio, joined **Dr. L. A. Veranth** in his practice at St. Cloud, in November. Dr. Coseriu received his medical education in Romania. He spent a year interning at St. Elizabeth Hospital in Youngstown and was also a surgical resident in Youngstown.

* * *

Dr. Paul H. Lober, pathology department, University of Minnesota, was recently made a member of the American Board of Pathology.

* * *

Opening practice in Buffalo Lake in November was **Dr. Daniel H. Bessesen.** Until December 1, when Dr. Bessesen moves to Buffalo Lake his practice will be on a part-time basis. Dr. Bessesen has been in practice in Minneapolis since he was separated from the army in 1945 after eighteen years of service.

BLUE CROSS—BLUE SHIELD

A few weeks ago an internist called the Blue Shield office to inquire how he could collect medical fees for the care of in-hospital Blue Shield subscribers. He discussed three cases, in each one of which he was the initial attending physician. For none of them had he been able to collect a Blue Shield claim for in-hospital medical care. Such cases represent a real problem to both the attending doctors and Blue Shield personnel.

In each of the three instances mentioned, the surgeon or other physician called in to attend the case had sent his claim to Blue Shield before one was received from the internist. In two cases, the surgeon's claim involved the entire period the patient was in the hospital and thus did not permit payment by Blue Shield of medical care fees to the original or admitting physician. And again, in the third instance, medical fees for the entire twenty-one days of in-hospital medical care provided by the Blue Shield contract were paid to another physician called in on the case.

In all three of these cases, the surgeon or consulting physician was paid by Blue Shield because their claims were received first and carried no evidence that another doctor had attended the subscriber. Had the internist

filed his claim with Blue Shield as soon as the subscriber was discharged from the hospital, he would have received the Blue Shield fees to which he was entitled.

Still another safeguard is involved in all these cases, namely: listing on the claim blank the name of any other physician or surgeon attending the patient during that period of hospitalization. There is a place on the Medical Service Report for listing other physicians in attendance. In most instances, the initial attending doctor does give the name and address of any doctor he has called in on the case. However, very frequently the operating surgeon or other consulting physician fails to list the original attending doctor, and when their Blue Shield claims are received first, the initial attendant's Blue Shield claim cannot be paid.

All such inequities and misunderstandings can be avoided by two simple measures. The first consists of filing Blue Shield claims as soon as possible after the full service is rendered. And the second measure is the listing in the space provided for this information in the Blue Shield Medical Service Report of the name and address of each doctor who has seen the patient during that period of hospitalization. If both the originally attending physician and all other physicians called in on the case would extend this courtesy to their confrères the proper payment by Blue Shield of all such justifiable claims would be largely solved.

On October 1, 1952, the revised Blue Shield contract and Schedule of Payments, both carrying increased benefits, became effective. Services rendered prior to October 1, 1952, are not affected by the changes. In order to avoid conflicts, every doctor is requested to submit, as soon as possible, his claims for services rendered prior to October 1, 1952.

BOOK REVIEWS

Books listed here become the property of the Ramsey, Hennepin and St. Louis County Medical Libraries when reviewed. Members, however, are urged to write reviews of any or every recent book which may be of interest to physicians.

BACTERIAL AND MYCOTIC INFECTIONS OF MAN. Second Edition. Edited by René J. Dubos, Ph.D. The Rockefeller Institute for Medical Research. 886 pages. Illus. Price $7.50, cloth. Philadelphia: J. B. Lippincott Co., 1952.

VASCULAR DISEASES IN CLINICAL PRACTICE. By Dr. Irving Sherwood Wright, M.D., Professor of Clinical Medicine, Cornell University Medical College. 2nd Edition. 552 pages. Illus. Price: $8.50. Chicago: The Year Book Publishers, Inc., 1952.

Most books on the circulatory system devote nearly all their attention to the heart. This book confines its discussions to the anatomy, physiology, abnormalities and diseases of the blood and lymph vessels. It discusses in detail the symptoms and mechanism of those symptoms, also many special but practical diagnostic tests, and treatment of vascular diseases.

One of the best chapters is on varicose veins. Chapter X on Neurovascular Snydromes of the Shoulder Girdle is most interesting. Chapter XXIX on Industrial and Medical Legal Medicine—Its Relation to Peripheral Vascular Disease and Injury is unique. These are only three of the thirty concise, yet comprehensive chapters containing an amazing amount of information packed into a book of this size. It is well written, is printed on excellent paper, and contains many good illustrations, some in color. Well worth the price.

MINNESOTA ACADEMY OF MEDICINE

(Continued from Page 1150)

In regard to silk versus catgut: silk may be more hazardous, but catgut is more difficult to work with.

We have no Vitamin C level studies, but we used to use it empirically. We have abandoned it, and the hemorrhages are no more frequent.

The meeting was adjourned.

Wallace P. Ritchie, M.D., *Secretary*

Meeting of April 9, 1952

The regular monthly meeting of the Minnesota Academy of Medicine was held at the Town and Country Club on Wednesday evening, April 9, 1952. Dinner was served at 7 p.m. and the meeting was called to order at 8 P.M. by the President: Dr O. H. Wangensteen.

There were forty-nine members and four guests present.

Minutes of the March meeting were read and approved.

Upon ballot, the following men were elected as candidates for membership in the Academy:

Dr. Leo Culligan	Minneapolis
Dr. Robert F. McGandy	Minneapolis
Dr. Richard Varco	University of Minnesota

Dr. Wangensteen then introduced the speaker of the evening.

Dr. Richard V. Ebert, Chief of Medical Service, at the Veterans Administration Hospital, Minneapolis, gave a talk on "The Pathological Physiology of Pulmonary Emphysema." Lantern slides were shown.

The meeting was adjourned.

Wallace P. Richie, M.D., *Secretary*

EVANSVILLE IND USA

...dispels the shadow of Rickets

Even in America today, surveys of certain groups reveal a surprising incidence of rickets.

To combat this danger, physicians realize the need for *regular* and *reliable* antirachitic measures.

A potent and economical source of vitamins A and D, Mead's Oleum Percomorphum has provided effective protection for millions of infants and children. For 17 years, physicians have placed faith in it.
